"That's all very well as an emergency measure, but we've got to find the haunt of that gang and smash it!"

An orderly brought in a telegraphic dispatch and handed it to him. The Vice-president opened it, glanced through it, and tried to hand it to the Secretary of State. Instead, it fluttered from his nerveless fingers, and he sank back with a groan. The Secretary picked it up and glanced at it.

"Gentlemen," he said, trying to control his voice, "New York was bombed out of the blue at sunrise this morning, and the whole lower part of the city is a heap of ruins."

In the days that followed it became clear that all the resources of America would be needed to cope with the Invisible Empire. Not a day passed without some blow being struck. Boston, Charleston, Baltimore, Pittsburg in turn were devastated. Three cruisers and a score of minor craft were sunk in the harbor of Newport News, where they were concentrating, and thenceforward the fleet became a fugitive force, seeking concealment rather than an offensive. Trans-Atlantic sea-traffic ceased.

Meanwhile the black gas was being hurriedly manufactured. From cylinders placed in central positions in a score of cities it was discharged continuously, covering these centers with an impenetrable pall of night that no light would penetrate. Only by the glow of radium paint, which commanded fabulous prices, could official business be transacted, and that only to a very small degree.

Courts were closed, business suspended, prisoners released, perforce, from jails. Famine ruled. The remedy was proving worse than the disease. Within a week the use of the dark gas had had to be discontinued. And a temporary suspension of the raids served only to accentuate the general terror.

There were food riots everywhere, demands that the Government come to terms, and counter-demands that the war be fought out to the bitter end.

Fought out, when everything was disorganized? Stocks of food congested all the terminals, mobs rioted and battled and plundered all through the east.

"It means surrender," was voiced at the Council meeting by one of the members. And nobody answered him.

Three days of respite, then, instead of bombs, proclamations fluttering down from a cloudless sky. Unless the white flag of surrender was hoisted from the summit of the battered Capitol, the Invisible Emperor would strike such a blow as should bring

America to her knees!

It was a twelve-hour ultimatum, and before three hours had passed thousands of citizens had taken possession of the Capitol and filled all the approaches. Over their heads floated banners—the Stars and Stripes, and, blazoned across them the words, "No Surrender."

It was a spontaneous uprising of the people of Washington. Hungry, homeless in the sharpening autumn weather, and nearly all bereft of members of their families, too often of the breadwinner, now lying deep beneath the rubble that littered the streets, they had gathered in their thousands to protest against any attempt to yield.

Dick, flying overhead at the apex of his squadron, felt his heart swell with elation as he watched the orderly crowds. This was at three in the afternoon: at six the ultimatum ended, the new frightfulness was to begin.

At five, Vice-president Tomlinson was to address the crowds. The old man had risen to the occasion. He

had cast off his pompousness and vanity, and was known to favor war to the bitter end. Dick and his squadron circled above the broken dome as the car that carried the Vice-president and the secretaries of State and for War approached along the Avenue.

Rat-tat, rat-a-tat-tat!

Out of the blue sky streams of lead were poured into the assembled multitudes. Instantly they had become converted into a panic-stricken mob, turning this way and that.

Rat-a-tat-tat. Swaths of dead and dying men rolled in the dust, and, as wheat falls under the reaper's blade, the mob melted away in lines and by battalions. Within thirty seconds the whole terrain was piled with dead and dying.

"My God, it's massacre! It's murder!" shouted Dick.

They had not even waited for the twelve hours to expire. To and fro the invisible airplanes shot through the blue evening sky, till the last fugitives were

streaming away in all directions like hunted deer, and the dead lay piled in ghastly heaps everywhere.

Out of these heaps wounded and dying men would stagger to their feet to shake their fists impotently at their murderers.

In vain Dick and his squadron strove to dash themselves into the invisible airships. The pilots eluded them with ease, sometimes sending a contemptuous round of machine-gun bullets in their direction, but not troubling to shoot them down.

Two small boys, carrying a huge banner with "No Surrender" across it, were walking off the ghastly field. Twelve or fourteen years old at most, they disdained to run. They were singing, singing the National Anthem, though their voices were inaudible through the turmoil.

Rat-tat! Rat-tat-a-tat! The fiends above loosed a storm of lead upon them. Both fell. One rose, still clutching the banner in his hand and waved it aloft. In a sudden silence his childish treble could be heard:

My country, 'tis of thee
Sweet land of lib-er-ty—

The guns rattled again. Clutching the blood-stained banner, he dropped across the body of his companion.

Suddenly a broad band of black soared upward from the earth. Those in charge of the cylinders placed about the Capitol had released the gas.

A band of darkness, rising into the blue, cutting off the earth, making the summit of the ruined Capitol a floating dome. But, fast as it rose, the invisible airships rose faster above it.

A last vicious volley! Two of Dick's flight crashing down upon the piles of dead men underneath! And nothing was visible, though the darkness rose till it obliterated the blue above.

At dawn the Council sat, after an all-night meeting. Vice-president Tomlinson, one arm shattered by a machine-gun bullet, still occupied the chair at the head of the table.

Outside, immediately about the White House, there was not a sound. Washington might have been a city of the dead. The railroad terminals, however, were occupied by a mob of people, busily looting. There was great disorder. Organized government had simply disappeared.

Each man was occupied only with obtaining as much food as he could carry, and taking his family into rural districts where the Terror would not be likely to pursue. All the roads leading out of Washington—into Virginia, into Maryland, were congested with columns of fugitives that stretched for miles.

Some, who were fortunate enough to possess automobiles, and—what was rarer—a few gallons of gas, were trying to force their way through the masses ahead of them; here and there a family trudged beside a pack-horse, or a big dog drew an improvised sled on wheels, loaded with flour, bacon, blankets, pillows. Old men and young children trudged on uncomplaining.

The telegraph wires were still, for the most part,

working. All the world knew what was happening. From all the big cities of the East a similar exodus was proceeding. There was little bitterness and little disorder.

It was not the airship raids from which these crowds were fleeing. Something grimmer was happening. The murderous attack upon the populace about the Capitol had been merely an incident. This later development was the fulfilment of the Invisible Emperor's ultimatum.

Death was afield, death, invisible, instantaneous, and inevitable. Death blown on the winds, in the form of the deadliest of unknown gases.

In the Blue Room of the White House a score of experts had gathered. Dick, too, with the chiefs of his staff, Stopford, and the army and naval heads. Among them was the chief of the Meteorological Bureau, and it was to him primarily that Tomlinson was reading a telegraphic dispatch from Wilmington, South Carolina:

"The Invisible Death has reached this point and is working havoc throughout the city, spreading from street to street. Men are dropping dead everywhere. A few have fled, but—"

The sudden ending of the dispatch was significant enough. Tomlinson picked up another dispatch from Columbia, in the same State:

"Invisible Death now circling city," he read. "Business section already invaded. All other telegraphists have left posts. Can't say how long—"

And this, too, ended in the same way. There were piles of such communications, and they had been coming in for eighteen hours. At that moment an orderly brought in a dozen more.

Tomlinson showed the head of the Meteorological Bureau the chart upon the table. "We've plotted out a map as the wires came in, Mr. Graves," he said. "The Invisible Death struck the southeast shore of the United States yesterday afternoon near Charleston. It has spread approximately at a steady rate. The wind

velocity—?"

"Remains constant. Seventy miles an hour. Dying down a little," answered Graves.

"The death line now runs from Wilmington, South Carolina, straight to Augusta, Georgia," the Vice-president pursued. "Every living thing that this gas has encountered has been instantly destroyed. Men, cattle, birds, vermin, wild beasts. The gas is invisible and inodorous. These gentlemen believe it may be a form of hydrocyanic acid, but of a concentration beyond anything known to chemistry, so deadly that a billionth part of it to one of air must be fatal, otherwise it could not have traveled as it has done. Warnings have been broadcasted, but there are no stocks of chemicals that might counteract it. Flight is the only hope—flight at seventy miles an hour!"

His voice shook. "This gas has been loosed, as you told us, upon the wings of the hurricane that came through the Florida Strait. What are the chances of its reaching Washington?"

"Mr. Vice-president, if the wind continues, and this gas has sufficient concentration, it should be in Washington within the next eight hours." Graves replied. "If the wind changes direction, however, this gas will probably be blown out to sea, or into the Alleghanies, where it will probably be dissipated among the hills, or by the foliage on the mountains. I'm not a chemist—"

"No, sir, and I am not consulting you as one," answered old Tomlinson. "A death belt several hundred miles in length and three or four hundred deep has already been cut across this continent. We are faced with wholesale, unmitigated murder, on such a scale as was never known before. But we are an integral part of America, and Washington has no more right to expect immunity than our devastated Southern States. The question we wish to put to you is, can you trace the exact course taken by the hurricane?"

"I can, Mr. Vice-president," answered Graves. "It originated somewhere in the West Indian seas, like all these storms. We've been getting our reports almost

as usual. Our first one came from Nassau, which was badly damaged. The storm missed the Florida coast, as many of them do, and struck the coast of South Carolina—in fact, we received a report from Charleston, which must have almost coincided with your first report of the gas."

"If the storm missed the Florida coast, it follows that the gas was not discharged from any point on the American continent," said Tomlinson. "From some point off Florida—from some island, or from a plane or from a ship at sea."

"Not from a ship at sea, Mr. Vice-president," interposed the head of the Chemical Bureau. "To discharge gas on such an extensive scale would require more space than could be furnished by the largest vessel, in my opinion."

"In all probability the gas was 'loaded,' so to say, onto the gale somewhere in the Bahamas," said Graves. "That seems to me the most likely explanation."

Vice-president Tomlinson nodded, and picked up one

of the latest telegraphic dispatches, as if absently.

"Gentlemen," he said, "the Invisible Death has already reached Charlotte."

He picked up another. "Reported Abaco Island, Bahamas, totally wrecked by storm. All communication has ceased," he read. He turned to Dick and spoke as if inspired. "Captain Rennell, there is your destination," he thundered. "They've betrayed themselves. We've got them now. You understand?"

"By God, sir! It's from Abaco Island, then, that those devils have been carrying on their game of wholesale murder!"

Suddenly a contagion of enthusiasm seemed to sweep the whole assemblage. Every man was upon his feet in an instant, white, quivering, lips opened for speech that trembled there and did not come.

It was Secretary Norris spoke. "The Vice-president has hit the mark," he said, with a dramatic gesture of his arm. "Yes, they've betrayed themselves. Their

headquarters are on Abaco Island. It's one of the largest in the Bahamas." He turned to the Secretary for the Navy. "You can rush the fleet there, sir?" he asked.

"Within forty-eight hours I'll have every vessel that can float off Abaco Island."

"I'll concentrate all airplanes. Take your flight, Captain Rennell. We'll stamp out that nest of murderers if we blow Abaco Island to the bottom of the sea. It can be done!"

"It can be done, sir—with Luke Evans and his invention," answered Dick.

Chapter 7: On the Trail

Three hours later, about the time when the war council rose after completing its plans, a sudden shift of the wind blew the poison gas out to sea, just when it appeared certain that it would reach the capital of the nation.

The southern half of Virginia had been swept over. Operators, telegraph and telephone, staying at their posts had sent in constant messages that had terminated with an abruptness which told of the tragic sequel. Yet, at that distance from its source, the intensity of the gas had been to some extent dissipated.

Poisonous beyond any gas known, so deadly as to make hydrocyanic gas innocuous in comparison, still as it was swept northward on the wings of the wind, there had been an increasing number of non-fatal casualties. The most northernly point reached by the gas was Richmond, and here some fifty per cent of those stricken had suffered paralysis instead of death.

But a new element had been injected into the situation. Even the heroic courage shown by the populace in the beginning had had its limits. The morning after the news of the Invisible Death's advent was made public mobs had gathered in all the large cities of the East, demanding surrender.

The submerged elements of crime and disorder had come to the surface at last. Committees were formed, with the avowed object of yielding to the Invisible Emperor, and averting further disaster. In Washington, a city of the dead, half the members of Congress and the Senators had gathered in the ruined Capitol, to debate the situation.

There were rumors of an impending march on the White House, of a coup d'état.

The action of the Government was prompt. Five hundred loyalists were enrolled, armed, and posted round the White House: every avenue of approach was commanded by machine-guns. Meanwhile the news was spread by radio that the headquarters of the Invisible Emperor had been located, and that a

strong bombing squadron was being dispatched to destroy it.

The entire fleet was to follow, and it was confidently anticipated that within a little while the Terror would be at an end.

Those at the white House were less sanguine. There was none but realized the diabolical strength of their antagonists.

"Everything depends upon the outcome of the next forty-eight hours, and everything depends on you, Rennell," said Secretary Norris to Dick, as he stood beside his plane. Behind him his flight of a dozen airships was drawn up.

"Find them," added the Secretary; "cover Abaco Island with the black gas, and the navy and the marines will wipe up the mess that you leave behind you. God help you—and all of us, Rennell!"

He gripped Dick's hand and turned away. Dick was very sober-minded as he climbed into his cockpit. He

knew to the full how much depended upon himself and Luke Evans. Already the shouts of the insurgents were to be heard at the ends of the barriers, commanded by the machine-guns, and patrolled by the enlisted volunteers.

Negro mobs were building counter-barricades of their own with rubble from the fallen edifices. Civil war might be postponed for eight-and-forty hours, but after that unless there was news of victory, the whole structure of civilization would be smashed irreparably.

It was up to Dick and Luke Evans, and they had assumed such a responsibility as rarely falls to the lot of man in war.

Dick was to lead the flight in a two-seater Barwell plane. This was one of the latest types, and had been hurriedly adapted to the purpose for which it was to be used. Dick himself occupied the rear seat, with its dual controls, and the gun in its armored casing. In front sat old Luke Evans, in charge of the black gas projector.

His famous camera box, containing a minute quantity of gas in slow combustion, and projecting the black searchlight, had been built into the plane. In the rack beside him were a number of the black gas bombs, each of which, dropped to earth, would release enough gas to cover a considerable area with darkness. Both Luke and Dick wore respirators filled with charcoal and sodium thio-sulphate, and beside Dick a cage containing three guinea-pigs rested.

These little rodents were so sensitive to atmospheric changes that a quantity of hydrocyanic acid too minute to affect a man would produce instantaneous death on them.

From its hiding-place off the Virginia coast the American fleet was steaming hotly southward toward Abaco Island, cruisers, destroyers, submarines. That Abaco was British territory had simply not been considered in this crisis of history.

The twelve airships that followed Dick's contained enough bombs to put the headquarters of the Invisible Empire out of business for good. The naval

guns would complete the same business.

All day Dick and Luke Evans flew southwestward. At first glance, everything appeared normal. The catastrophe that had fallen upon the land was visible only in the shape of the lines of tiny figures, extending for miles, that choked all the roads radiating out of the principal cities. It was only when they were over the southern portion of Virginia that the ravages of deadly gas became apparent.

Flying low, Dick could see the fields strewn with the bodies of dead cattle. Here and there, at the doors of farmhouses, the inmates could be seen, lying together in gruesome heaps, caught and killed instantaneously as they attempted flight. Here, too, were figures on the roads. But they were figures of dead men and women.

They strewed the roads for miles, lying as they had been trapped—men, women, children, horses, mules, and dogs. The spectacle was an appalling one. Dick set his jaws grimly. He was thinking that the Council had let Von Kettler escape. He was thinking of

Fredegonde. But he would not let himself think of her. She deserved no more pity than the rest of the murderous crew.

Over the Carolinas the conditions were still more appalling. Here deadly gas had struck with all its concentrated power. A city materialized out of the blue distance, a factory town with all chimneys spiring upward into the blue, a section of tall buildings intersected by canyonlike streets, around it a rim of trim houses, bungalows, indicative of prosperity and comfort. And it was a city of the dead.

For everywhere around it, on all the roads, the dead lay piled on top of one another. For miles—all the inhabitants, rich and poor, business men, factory hands, negroes. There had been a mad rush as the fatal gas drove onward upon its lethal way, and all the fugitives had been overwhelmed simultaneously.

Here were golf links, with little groups strewn on the grass and fairways; here, at one of the holes, four men, their putters still in their hands, crouched in death. Here was the wreckage of a train that had

collided with a string of freight cars at an untended switch, and from the shattered windows the heads and bodies of the dead protruded in serried ranks.

Dick looked back. His flight was driving on behind him. He guessed their feelings. They had sworn, as he had sworn, that none of them would return without stamping out that abomination from the earth forever.

He signaled to the flight to rise, and zoomed upward to twelve thousand feet. He did not want to look upon any more of those horrors. At that height, the peaceful landscape lay extended underneath, in a checker-board of farms and woodlands. One could pretend that it was all a vile dream.

He avoided Charleston, and winged out above the Atlantic, striking a straight course along the coast toward the Bahamas. The shores of Georgia vanished in the west. Dick began to breathe more freely. His mind shook off its weight of horror. Only the blue sea and the blue sky were visible. The aftermath of the gale remained in the shape of a strong head breeze and white crests below.

Dick glanced at the guinea-pigs. They were busily gnawing their cabbage and carrots. The gas had evidently been entirely dissipated by the wind.

Toward sunset the low jutting fore-land of Canaveral on the east coast of Florida, came into view. Dick shifted course a little. Three hours more should see them over Abaco.

His flight had explicit instructions. As soon as the black gas had rendered visible the headquarters of the Invisible Emperor, they were to circle above, dropping their bombs. When these were exhausted, the machine guns would come into play. There was to be no attention paid to signals of surrender. They were to wipe out the headquarters, to kill every living thing that showed itself—and the navy and the marines would mop up anything left over.

The sun went down in a blaze of gold and crimson. Night fell. The moon began to climb the east. The black sea, stretching beneath, was as empty as on the day when it was created. Nothing in the shape of navigation appeared.

Two hours, three hours, and old Evans turned round in his cockpit and pointed. On the horizon a black thread was beginning to stretch against the sky. It was Abaco Island, in the Bahama group. They were nearly at their destination. An hour more—perhaps two hours, and the deadly menace that threatened America might be removed forever. Dick breathed a silent prayer for success.

They were over Abaco. A long, flat island, seventy miles or so in extreme length, and fairly wide, covered with a dense growth of tropical brush and forest, with here and there open spaces, near the seacoast an occasional farm-house. Dick dropped to five thousand, to three, to one. The moon made the whole land underneath as bright as day.

There were no evidence of destruction by the hurricane. The farmhouses stood substantial and well roofed. If death had struck Abaco Island, it had been the work of man, not Nature.

Dick zoomed almost to his ceiling, until, in the brilliant moonlight, he could see Abaco Island from

side to side. For the most part it was heavily wooded with mahogany and lignum vitae: toward the central portion there was open land, but there was not the least sign of any construction work.

Again he swooped, indicating to his flight to follow him. At a thousand feet he examined the open district intently. Here, if anywhere upon the island, the Invisible Emperor had his headquarters. Was it conceivable that a gas factory, hangars, ammunition depots could exist here invisibly, when he could look straight down upon the ground?

Dick's heart sank. The hideous fear came to him that Graves had been mistaken, that he had come on a wild-goose chase. This could not be the place. It was quite incredible.

Again and again he circled, studying the ground beneath. Now he could see that the tough grass and undergrowth marked curious geometrical patterns. Here, for example, was an oblong of bare earth around which the vegetation grew, and it was obviously the work of man.

Here were four squares of bare ground set side by side, with thin strips of vegetation growing between them.

Then of a sudden Dick knew! Those squares and parallelograms of bare ground indicated the foundations of buildings. *He was looking down on the very site of the Invisible Emperor's stronghold!*

He shouted, and pointed downward. Luke Evans looked round and nodded. He understood. He patted the camera-box with a grim smile on his old face.

Chapter 8: The Magnetic Trap

Upon those squares and oblongs of bare earth, incredible as it seemed, rose the structures of the Invisible Empire, themselves both invisible and transparent, so that one looked straight down through them and saw only the ground beneath them.

Every interior floor and girder must have been treated with the gas. They had been cunning. They must have discovered some permanent means of charging paint with the shadow-breaking gas, so that the buildings would remain invisible for months and years instead of hours.

But they had not been cunning enough. It had not occurred to them that the foundations would still be visible underneath, for the simple reason that grass does not grow without sunlight.

Dick saw old Luke Evans nodding and pointing downward. The old man picked up his end of the speaking-tube, but Dick ignored the gesture. He signaled to his flight to rise, and zoomed up, circling,

and studying the land beneath.

That oblong was evidently the central building. Those four squares probably housed airplanes, and each would hold half a dozen. That elliptical building might contain a dirigible. That round patch was probably the gas factory.

Now Dick could see more patches of bare ground, extending in the direction of the sea. He gunned his ship and followed the gap among the trees to the ocean, a few miles distant. Yes, there were more evidence of activity here. Beside the water, in what looked like a deep natural harbor, was what seemed to be the foundations of a dock. Perhaps even vessels of war floated on the phosphorescent Bahama sea.

He circled back, his flock wheeling like a flight of birds and following him. He signaled to them to scatter. They had certainly been observed; at any moment a hail of lead might assail them invisibly out of the air. They must get to work quickly. But had they understood the significance of those bare patches?

Dick saw Luke Evans still fidgeting impatiently with his end of the speaking-tube, and picked it up.

"I'm thinking, Captain Rennell, we've got no time to lose if we want to keep the upper hand of those devils," called the old man.

"Yes, you're right," Dick answered. "Lay a trail of gas bombs all around those hangars and buildings, enough to hold them dark for some time. And keep a bomb or two in reserve."

Luke Evans shouted back. The plane was again above the structures. The old man dropped a bomb over the side, and Dick zoomed again, his flight wheeling up behind him.

Higher and higher, banking and going round in a succession of tight spirals, Dick flew. Every moment he expected the blow to fall. As he rose, Luke Evans dropped bomb after bomb. A thousand feet beneath the flight was taking up positions, hovering with the helicopters, looking up to Dick for the signal, and waiting.

Then from beneath the cloud of black gas began to rise, as Luke Evans dropped his bombs. It filled the lower spaces of the sky, blotting out the land in impenetrable darkness. That darkness, above which Dick and his flight were soaring, rose like a solid wall, built by some prehistoric race that aimed to fling a tower into the heavens.

And then—the miracle! Dick gasped in sheer delight as he realized that he had made no mistake.

At first all he could see was a number of criss-crossing phosphorescent lines that appeared shimmering through the blackness underneath. They ran luminously here and there, forming no particular pattern, much like the figures on the radium dial of a watch when first they come into wavering visibility at night.

Then the lines began to intersect one another, to assume geometric patterns and curves. And bit by bit they took meaning and significance.

And suddenly the whole invisible stronghold lay

revealed upon the ground beneath, a shining, dazzling play of weaving light.

Buildings and hangars stood out, clearly revealed; the rounded vault of a dirigible hangar, and the shining ribbon of a road that ran through a pitch-dark tarmac, and was evidently constructed from some gas-impregnated materials. On this tarmac was a flight of shining airplanes, ready to take off. There were the odd, ovoid figures of the aviators in their silken overalls. More figures appeared, running out from the buildings. It was clear that the sudden raid had taken them all by surprise.

Luke Evans yelled and pointed. "We've got them now, sir!" Dick heard above the whine of the helicopter engine. "We've—"

But of a sudden the old man's voice died away, though his mouth was still moving.

Dick leaned out of his cockpit and fired a single red Very light, the signal for the attack. And from each plane of his flight, beneath him, a bomb slid from its

rack and went hurtling down upon the gang below, while the airplanes circled and hovered, each taking up its station.

Dick was too late. By a whole minute he had missed his chance. He realized that immediately, for before the red light had flared from his pistol, the hostile planes were in the air. He had flown too low, and given the alarm.

It meant a fight now, instead of a mad dog destruction, and Dick did not underestimate the power of the enemy. But he felt a thrill of furious satisfaction at the prospect of battle. From every plane the bombs were falling. Underneath, ruin and destruction, and leaping flames—and yet darkness, save for the phosphorescent outlines of the buildings.

And the lines of these were broken, converging into strange criss-crosses of luminosity, as the beams fell in shapeless heaps. Dark fire, sweeping through the headquarters of the Invisible Emperor, a veritable hell for those below! A taste of the hell that they had made for others!

Then a strange phenomenon obtruded itself upon Dick's notice. *Nothing was audible!* The bombs were falling, but they were falling silently. No sound came up from beneath. And, except for the throbbing of his engine, Dick would have thought it had stopped. He could no longer hear it.

That terrific holocaust of death and destruction was inaudible. Skimming the upper reach of the air, high above that wall of darkness, Dick saw old Luke Evans pick up his end of the speaking-tube, and mechanically followed suit. He could see the old man's lips moving. But he heard nothing!

And now another phenomenon was borne in on his notice. His flight were perhaps five hundred feet beneath him, hovering a little above the barrage of black gas. But they were converging oddly. And there was no sight of the airplanes that Dick had just seen taking off from the invisible tarmac.

Dick fired two Very lights as a signal to his flight to scatter. What were they doing, bunching together like a flock of sheep, when at any moment the enemy

planes might come swooping in, riddling them with bullets? He thrust the stick forward—and then realized that his controls had gone dead!

He thought for a moment that a wire had snapped. But the stick responded perfectly to his hand, only it had no longer control over his plane. He kicked right rudder, and the plane remained motionless. He pushed home the soaring lever, to neutralize the helicopter and the plane still soared.

Then he noticed that the needle of his earth-inductor compass-indicator was oscillating madly, and realized that it was not his plane that was at fault.

Underneath him, his flight seemed to be milling wildly as the ships turned in every direction of the compass. But not for long. They were nosing in, until the whole flight resembled an enormous airplane engine, with twelve radial points, corresponding to their propellers, and the noses pointing symmetrically inward, like a herd of game, yarding in winter time.

And now the true significance came home to Dick. A

vertical line of magnetic force, an invisible mast, had been shot upward from the ground. The airplanes were moored to it by their noses, as effectively as if they had been fastened with steel wires.

And he, too, was struggling against that magnetic force that was slowly drawing him, despite his utmost efforts, to a fixed position five hundred feet above his flight.

For a few moments, by feeding his engine gas to the limit, Dick thought he might have a chance of escaping. Her nose a fixed point, Dick whirled round and round in a dizzy maze, attempting to break that invisible mooring-chain. Then suddenly the engine went dead. He was trapped helplessly.

He saw old Evans gesticulating wildly in the front cockpit. The old man hoisted himself, leaned over the cowlings gibbered in Dick's ear. The silent engine had ceased to throb, and the old man's shouts were simply not translated into sound.

Suddenly the flight beneath jerked downward, just as

a flag jerks when it is hauled down a pole. They vanished into the dark cloud beneath. At the same time there came a jerk that dropped Dick's plane a hundred feet, and flung him violently against the rim of the cockpit.

Another followed. By drops of a hundred feet at a time, Dick was being hauled down into the darkness underneath him.

It rushed up at him. One moment he was suspended upon the rim of it, seeing the moon and stars above him; the next he had been plunged into utter blackness. Blackness more intense than anything that could be conceived—soundless blackness, that was the added horror of it. Blackness of Luke Evans's contriving, but none the less fearful on that account!

And yet, as Dick was jerked slowly downward, slowly a pale visibility began to diffuse itself underneath. The black cloud was beginning to roll away. The luminous lines began to fade, and in place of them appeared little leaping tongues of fire. In front of him Dick saw Luke Evans's form begin to pattern itself

upon the darkness. He saw the form move sidewise, and caught at Luke's arm as he was about to hurl another gas bomb. "No!" he shouted—and heard no sound come from his lips.

Luke understood. He seemed to be replacing the bomb in the rack. Beneath them now, as they were jerked downward, were fantastic swirls of black mist, and, at the bottom, a pit of fire that was slowly coming into visibility.

Dick uttered a cry of horror! Five hundred feet below his plane he saw the dim forms of his flight, still bunched together, noses almost touching. And they were dropping straight into that flaming furnace of ruin underneath, which was growing clearer every instant.

Down, jerk by jerk. Down! The black cloud was fast dispersing from the ground. The flight were hardly a thousand feet above the fire. Down—a long jerk that one! Once more! The flames leaped up hungrily about the doomed airships. Cries of mad horror broke from Dick's lips as he witnessed the destruction of ships

and men.

He could see almost clearly now. The twelve ships, still retaining their nose-to-nose formation, were in the very heart of the fire. spurts of exploding gasoline thrust their white tongues upward. There was only one consolation: for the doomed men, death must have come practically instantaneously.

From where he hung, Dick could feel the fierce heat of the flames below. In front of him, old Luke Evans sat in his cockpit like one petrified. He was feebly fumbling at his camera-box, as if he had some idea of using it, and had forgotten that it was fixed to the plane, but the old man seemed temporarily to have lost his wits.

Rushing flames surrounded the burning airships, reducing them to a solid, welded mass of incandescent metal. Dick looked down, waiting for the next jerk that would summon him to join his men. At the moment he was not conscious of either fear or horror, only intense rage against the murderers and regret that he could never bring back the news of

victory.

The cloud had almost dissipated. In place of the phosphorescence, electric lights had appeared, making the ground beneath perfectly visible. Dick could see a number of men grouped together at the entrance to a large building, part of which had been wrecked by a bomb, though there were no evidences of fire. Other structures had been dismantled and knocked about, but what remained of them had not been charred by fire. Evidently they had been fireproofed. Perhaps the gas itself was incombustible. Only in the middle of the tarmac, where the remnants of the airplanes blazed, was there any sign of fire.

There were three machines resembling dynamos, placed one at each corner of the tarmac, equidistant from the central holocaust. A half-dozen men were grouped about each of them, and by the light from the huge reflector over each Dick saw that they were whirring busily. At the time it did not occur to him that these were the machines that were sending out the electrical force that had held the airplanes powerless.

But as he looked, his mind still a turmoil of hate and hopeless anger, he saw one of the three machines cease whirring. The group about it dispersed, the light above went out. And now his plane, as if drawn by the power of the two remaining machines, began to move jerkily again, not down toward the burning wreckage, but sidewise, away from it.

Straight out toward the side of the tarmac it moved jerked downward diagonally, until it rested only a few feet above the ground.

Then suddenly Dick felt the plane quiver, as if released from the power of the force that had held it. It nosed down and crashed, rolled over amid the wreckage of a shattered wing. The concussion shot Dick from the cockpit clear of the smashed machine.

He landed upon his head, and went out instantly.

Chapter 9: The Invisible Emperor

It was the sound of his name, spoken repeatedly, that brought Dick back to consciousness. He opened his eyes, blinking in broad daylight. He stared about him, and the first thing he saw was Luke Evans, regarding him anxiously from a little distance away. He saw that it was Luke who had spoken.

He had heard the old man distinctly. The condition of inaudibility was gone.

Not that of invisibility. Dick stared about him in bewilderment. For a moment, before he quite realized what had happened to him, he thought he had lost his mind. Underneath him was a thick rug, beneath his head a pillow; he could feel both of them, and yet all he could see was the open country, a clearing with shrubbery on either side, and, beyond that, a luxurious growth of tropical trees. Under him, to all visual appearance, was the bare ground.

He moved, and heard the clank of chains. He looked down at himself. His wrists were loosely linked to a

chain that seemed to stretch tight into vacancy and end in nothing. His ankles were bound likewise.

And both chains appeared to be of solid silver, but thick enough to give them the strength of iron!

Then he perceived that old Evans was bound in the same way.

"Rennell! Rennell!" repeated the old man in a sort of whimper. "Thank God you've come out of it! I was afraid you were dead."

"What's happened?" asked Dick. "Where are we? Didn't they get us?"

"They've got us, damn them!" snarled old Evans. "All the rest burned to cinders, those fine fellows, Rennell! You were thrown unconscious, but none of my tough old bones were hurt. They pulled us out of the wreckage and brought us in here and tied us with these silver chains."

"In here? But where are we?" demanded Dick, trying

to pass his hand across his aching forehead, and realizing that the chain, though it seemed fastened to nothing, was perfectly taut.

"In one of their damned invisible houses," whimpered the old man. "They're fireproof. Nearly all our bombs fell on the tarmac, and they did hardly any damage at all. One of those devils was bragging about it to me. I couldn't see anything but his eyes. And they've taken away my gas-box," wailed old Luke.

Dick cursed comprehensively and was silent. The burning rage that filled him left him incapable of other utterance. Silver chains! They must be madmen—yes, that was the only explanation. Madmen who had escaped from somewhere, obtained possession of scientific secrets, and banded themselves together to overcome the world. If he could get the chance of a blow at them before he died!

He heard a door swing open—a door somewhere out on the prairie. Two men sprang into sudden visibility and approached him. There was nothing invisible about these men, though they had seemed to have

materialized out of nothing. They wore the same black, trimly fitting uniform that Dick had seen in the White House. They were flesh and blood human beings like themselves.

"I congratulate you upon your recovery, Captain Rennell," remarked one of them with ironical politeness. "Also upon your shrewd coup. Needless to say, it had no chance of success, but we were misinformed as to the hour at which you might be expected. We thought it would take the fools at Washington a little longer to puzzle out our location—and then we did not put quite sufficient force into our hurricane. Quite an artificial one, Captain."

Dick, glaring at them, said nothing, and the one who had spoken turned to his companion, laughing, and said something in a foreign language that he did not recognize.

"His Majesty the Emperor commands your presence, and that of this old fool," said the first man. "Do not attempt to escape us. Death will be instantaneous." He drew a glass rod from his pocket, the tip of which

glowed with a pale blue light.

Again he spoke to his companion, who moved apparently a few feet distant out on the prairie. Suddenly Dick saw old Evans' chain slacken: then Dick's slackened too. He understood that he was unbound, though his wrists and ankles were still loosely fastened.

The second man took his station beside Luke Evans and motioned to him to rise. The first man beckoned to Dick to do the same. The two prisoners got upon their feet, trailing each a length of clanking chain. Each of the two guards covered his captive with the glass rod and motioned to him to precede him.

Choking with fury, Dick obeyed. He had taken a dozen steps with his guard uttered a sharp command to halt, at the same time shouting some word of command.

The edge of a door appeared, also seeming to materialize out of space. It widened, and Dick realized that he was looking at the unpainted inner side of a door whose outside was invisible. Beyond the

door appeared a flight of steps.

Dick passed through and descended them. He counted fifteen. He emerged into a timbered underground passage, well lit with lamps, filled with what seemed to be mercury vapor. Behind him walked his guard: behind the guard he heard Luke Evans shambling. Both chains were clinking, and again Dick's fury almost overcame him.

He controlled himself. He had no hope or desire for life, but he meant to strike some sort of blow before he died, if it were possible.

They turned out of the timbered passage, Dick's guard now walking at his side, the glass rod menacing his back. Dick found himself in a large subterranean room of extraordinary character. The walls were not merely timbered, but paneled. Pictures hung upon them, there were soft rugs underfoot, there was antique furniture. Everything was in plain sight.

There was a door at the farther end, from beyond which came the murmur of voices. Two guards in the

same black uniform, but without the ornamental silver braid, stood to attention, long halberds in their hands. One spoke a challenge.

The guard at Dick's side answered. The two men stepped backward, each about two feet, and pulled the two cords on either side of a curtain behind the open door. Dick passed through.

He stopped in sheer amazement. The gorgeousness of this larger room into which he entered was almost stupefying. It seemed to have been lifted bodily from some European palace. Mirrors with gilt edges ran along the side. On the floor was a single huge rug of Oriental weave.

At the farther end was a throne of gilt, lined with red velvet in which sat a man. An old man, of perhaps eighty years, with a grey peaked beard and fierce, commanding features. On his head was a gold crown glittering with gems. About him were gathered some twoscore men and a few women.

Those ranged on either side of the throne wore, like

its occupant, robes of red, lined with ermine. The rank behind wore shorter robes, less decorative, but no less extraordinary. They might all have stepped out of some medieval court.

Behind this second line, and half-encircling them, were officers in the black uniform with the silver braid.

There had been chattering, but as Dick passed through into the room it was succeeded by complete silence. Dick fixed his eyes upon the old man on the throne.

He knew him! Knew him for a once famous European ruler who had lost his throne in the war. A man always of unbalanced mentality, who, after living for years in exile, had been reported dead three years before. A madman who had vanished to make this last attempt upon the world, aided and abetted by the secret group of nobles who had surrounded him in the days of his pomp and power.

Old men, all of those in the first line! Madmen too,

perhaps, as madness begets madness. Behind them, younger men, infected by the strange malady, and enthusiastic for their desperate cause.

Yes, Dick knew this Invisible Emperor, lurking here in his underground palace. He knew Von Kettler, too, in the second line, close to the Emperor's throne. And, among the women in their robes, grouped picturesquely about that throne, he knew Fredegonde Valmy.

Dark-haired beneath her coronet, of radiant beauty, she fixed her eyes upon Dick's. Not a muscle of her face quivered.

Then only did Dick see something else, which he had not hitherto observed, owing to its concealment by the robes of those grouped about the Emperor, and the sight of it sent such a thrill of fury through him that he stood where he was, unable to speak or move a muscle.

The throne was set on a sort of dais, with three steps in front of it. The lowest of these steps was hollow.

Within this hollow appeared the head and shoulders of a man.

An elderly man clothed in parti-colored red and yellow, the time-honored garment of court fools. He was on his hands and knees, and the round of his back fitted into the hollow of the step, and had a flat board over it, so that the Emperor, in ascending his throne, would place his foot upon it.

He was kept in that position with heavy chains of what looked like gold, which passed about his neck and arms, and fitted into heavy gold staples in the wood. And the old man was President Hargreaves of the United States!

The President of the American Republic, chained as a footstool for the Invisible Emperor, the madman who defied the world. Dick stood petrified, staring into the mild face of the old man, still incapable of speech. Then a herald, carrying a long trumpet, to which a square banner was attached, strode forward from one side of the grotesque assemblage.

"Dog, on your knees when His Majesty deigns to admit you to the Presence!" he shouted.

The guard at Dick's side prodded him with his glass rod.

Then the storm of mad fury in Dick's heart released limbs and voice. The cry that came from his lips was like nothing human. He leaped upon the guard with a swift uppercut that sent him sprawling.

The glass rod slipped from his hands to the rug, striking the edge of his shoe, and broke to fragments. A single streak of fire shot from it, blasting a black streak across the Oriental rug.

Dick leaped toward the throne, and the assemblage, as if paralyzed by his sudden maneuver, remained watching him without moving. Then a woman screamed, and instantly the picturesque gathering had dissolved into a mob placing itself about the person of the Emperor, who sprang from his throne in agitation.

Dick was almost at the steps. But it was not at the Emperor that he leaped. He sprang to Hargreaves's side. "Mr. President, I'm an American," he babbled. "We've located this gang, we'll blow them off the face of the earth. In chains—God, in chains, sir—"

Dick stumbled over the length of his own chain that he had been dragging behind him—stumbled and fell prone upon the floor. Before he could regain his feet they were upon him.

A dozen men were holding him, despite his mad, frenzied struggles, and as, at length, he paused, exhausted, one of them, covering his head with a glass rod, looked up at the Emperor, who had resumed his seat.

Dick calmed himself. Still gripped, he straightened his body, and gave the mad monarch back look for look. For a moment the two men regarded each other. Then a peal of laughter broke from the Invisible Emperor's lips. And any one who heard that peal—any one save

those accustomed to him—might have known that it was a madman's laughter.

He flung back his head and laughed, and the whole crowd laughed too. All those sycophants roared and chuckled—all except Fredegonde. It was not till afterward that Dick remembered that.

He stood up. "Dog of an American," he roared, "do you know why you were brought here? It was because I wanted one Yankee to live and see the irresistible powers that I exercise, so that he can go back and report on them to those fools in Washington who still think they can defy me, the messenger of the All-Highest.

"I tell you that the things I have done are nothing in comparison with the things that I have yet to do, if your insane government of pig-headed fools persists in its defiance. It is my plan to send you back to tell them that their President lies bound in gold chains as my footstool. That the hurricane which spread the gas through southern America was a mere summer zephyr in comparison with the storm that I shall send

next.

"All the resources of Nature are at my command thanks to the illustrious chemists who have been secretly working for the past ten years to serve me. I, the All-Highest, have been commanded by the Almighty to scourge the world for its insolence in rejecting me, and especially the pig-race of Yankees whose pride has grown so great. Mine is the divinely appointed task to cast down your ridiculous democracies and re-establish the divine world-order of an Emperor and his nobility.

"That is why I have chosen, to permit so mean a thing as you to live. As for the old fool beside you, who thought to stay my power with his box of tricks—his gas-box is already being analyzed by my chemists, and in a few hours the trivial secret will be at my disposal."

"And that's just where you're wrong," piped old Luke Evans in his cracked voice. "That gas can't be analyzed, because it contains an unknown isotope, and, as for yourself, you're nothing but a daft old fool,

with your tin-horn trumpery!"

For a moment the Emperor stood like a statue, staring at old Luke. The expression on his face was that of a madman, but a madman through whose brain a straggling ray of realization has dawned. It was the look upon his face that held the whole assemblage spellbound. Then suddenly came intervention.

Through a doorway in the side of the hall came one of the officers in black. He advanced to the foot of the throne and made a deep, hurried bow, speaking rapidly in some language incomprehensible to Dick.

The Emperor started, and then a peal of laughter left his lips.

"Pig of a Yankee," he shouted to Dick, "your contemptible navy's now approaching our shores, with a dirigible scout above it. You shall now see how I deal with such swine!"

Chapter 10: The Tricks of the Trade

He barked a command, and instantly Dick was seized by two of the guards, one of whom—the one Dick had knocked down—took the occasion to administer a buffeting in the process of overcoming him. For the sight of the honored President of the United States—that kindly old man straining his eyes to meet Dick's own—in the parti-colored garb of red and yellow, and chained like a beast below the madman's throne, again filled Dick with a fury beyond all control.

It was only when he had been half-stunned again by the vicious blows of his captors, delivered with short truncheons of heavy wood, that at length he desisted from his futile struggle.

With swimming eyes he looked upon the gathering about the throne, which, again taking its cue from the madman, was roaring with laughter at his antics. And again Dick's eyes encountered those of Fredegonde Valmy.

The girl was not smiling. She was looking straight at

him, and for a moment it seemed to Dick as if he read some message in her eyes.

Only for an instant that idea flashed through his mind. He was in no mood to receive messages. As he stood panting like a wild beast at bay, suddenly a filmy substance was thrown over his head from behind. Then, as his face emerged, and the rest of his body was swiftly enveloped, he realized what was happening.

They had thrown over him one of the invisible garments. He could feel the stuff about him, but he could no longer see his own body or limbs.

From his own ken, Dick Rennell had vanished utterly. Where his legs and feet should have been, there was only the rug, with the burn from the glass tube. He raised one arm and could not see arm or fingers.

In another moment invisible cords had been flung around him. Dick's efforts to renew the struggle were quickly cut short. Trussed helplessly, he could only stand glaring at the madman rocking with laughter

upon his tinsel throne. Beside him, similarly bound, stood Luke Evans, but Dick was only conscious of the old man's presence by reason of the short, rasping, emphatic curses that broke from his lips.

The Emperor turned on his throne and beckoned to Von Kettler, who approached with a deferential bow.

"Nobility, we charge you with the care of these two prisoners," he addressed him. "Have the old one removed to the laboratory, and give orders that he shall assist our chemists to the best of his power in their analysis of the black gas. As for the other, take him up to the central office, and show him how we deal with Yankees and all other pigs. Show him everything, so that he may take back a correct account of our irresistible powers when we dismiss him."

"Come!" barked one of the guards in Dick's ear.

Dick attempted no further resistance. Convinced of its futility, sick and reeling from the blows he had received, he accompanied his captors quietly. There

was nothing more that he could do, either for President Hargreaves or for old Luke, but he still imagined the possibility of somehow warning the approaching fleet or the occupants of the dirigible.

He was led along the passage, past the guards, and up the stairs again. The top door opened upon vacancy; it closed, and vanished. Dick felt the rugs beneath his feet, but he was to all appearances standing on a square of bare earth in the middle of a prairie.

"Come!" barked the guard again, and Dick accompanied him, trailing his silver chain. Behind came Von Kettler.

"Here are steps!" said the guard, after they had proceeded a short distance.

Dick stumbled against the lowest step of an invisible flight. The breeze was cut off, showing that they had entered a building. Underneath was a large oval of bare ground. Dick found a handrail and groped his way up around a spiral staircase, four flights of it.

"Here is a room!"

Dick saw that widening edge of door again. The room inside was perfectly visible, though it seemed to be supported upon air. It was a spheroid, of huge size, with a number of large windows set into the walls, and it was filled with machinery. About a dozen workmen in blue blouses were moving to and fro, attending to what appeared to be a number of enormous dynamos, but there were other apparatus of whose significance Dick was ignorant. The dynamos were whirring with intense velocity, but not the slightest sound was audible.

Von Kettler stepped to a switch attached to a stanchion of white metal, surmounted by a huge opaque glass dome, and threw it over. Instantly the hum and whir of machinery became audible, the sound of footsteps, the voices of the workmen, and the creak of boards beneath their feet.

"You see, we have discovered the means of destroying sound waves as well as shadows, and it was a much simpler feat," said Von Kettler with a sneer. "Tell them

that when you get back to Washington, Yankee pig. Also you might be interested to know that most of your bombs fell on camouflaged structures that we had erected with the intention of deceiving you."

He gestured to Dick to precede him, and halted him at a plain round iron pipe or rod that rose up through the floor and passed through the roof. It was surrounded by a mesh of fine wire. Attached to it were various gauges, with dials showing red and black numbers.

"This is perhaps our greatest achievement, swine," remarked Von Kettler, affably. "You shall see its operations from above." He pointed to a narrow spiral staircase rising at the far end of the room. "It is the practical application of Einstein's gravitation and electricity in field relation. It is by means of this, and the three dynamos on the ground that we were able to neutralize your engines last night and bring them down where we wanted them. You must be sure to tell the Washington hogs about that."

He motioned to Dick to cross the room and ascend the

spiral staircase. Following him, he flung another switch similar to the first one, and instantly all sound within the room was cut off.

They ascended the winding flight and emerged upon a floor or platform. Dick felt it under his feet, but he could see nothing except the ground, far beneath him. He seemed to be suspended in the void. He stopped, groping, hesitating to advance. Von Kettler's jarring laugh grated on his ears.

"Don't be afraid, swine," he jeered. "This place is enclosed. There is a shadow-breaking device on every floor, which renders us complete masters of camouflage."

A switch snapped. Dick found himself instantly in a rotunda, roofed with glass, sections of which were raised to a height of three or four feet from the wooden base, admitting a gentle breeze. Three or four men were moving about in it, but these wore the black uniform with the silver braid, and Von Kettler's manner was deferential as he addressed them, jerking his hand contemptuously toward Dick. Grins of

derision and malice appeared on all the faces.

Save one, an elderly officer, apparently of high rank, who came forward and raised his hand to the salute.

"Captain Rennell," he said, "we are at war with your nation, but we are also, I hope, gentlemen." He turned to Von Kettler. "Is it seemly," he asked, "that an officer of the American army should be brought here in chains and cords?"

"Excellency, it is His Majesty's command," responded Von Kettler, with a servile smirk that hardly concealed his elation. "Moreover, the American is to witness the forthcoming destruction of the Yankee fleet."

The elderly officer reddened, turned away without replying. Dick looked about him.

There was less machinery in this room. The iron pillar that he had seen came through the floor and terminated some five feet above it in another of the opaque glass domes, filled with iridescent fire. About it was a complicated arrangement of dials and

gauges.

In the centre of the room was a sort of camera obscura. A large hood projected above a flat table, and an officer was half-concealed beneath it, apparently studying the table busily.

"Come, American, you shall see your navy on its way to destruction," said Von Kettler, beckoning Dick within the hood.

The officer stepped from the table, whose top was a sheet of silvered glass, leaving Von Kettler and Dick in front of it. Dick looked. At first he could see nothing but the vast stretch of sea; then he began to make out tiny dots at the table's end, terminating in minute blurs that were evidently smoke from the funnels.

"Your ships," said Von Kettler, smiling. "This is the dirigible." He pointed to another dot that came into sight and disappeared almost instantly. "They are a hundred and fifty miles away. Explain to your friends in Washington that our super-telescopic sights are based upon a refraction of light that overcomes the

earth's curvature. It is simple, but it happens not to have been worked out until my Master commanded it."

Dick watched those tiny dots in fascination, mentally computing. At an average speed of fifty knots an hour, the squadron's steaming rate, they should be off the coast within three hours. The dirigible would take two, if it went ahead to scout, as was almost certain.

Dick stepped back from beneath the hood and glanced about him. If only his arms were not bound, he might do enough damage within a few seconds to put the deadlier machinery out of commission, if only the silvered mirror. He glanced about him. Von Kettler, interpreting his thought, smiled coolly.

"You are helpless, my dear Yankee pig," he said. "But there is more to see. Oblige me by accompanying me up to the top story."

He pointed to a ladder running up beside the iron pillar through an opening in the roof, and Dick, with a shrug of the shoulders, complied. He emerged upon a

small platform, apparently protruding into vacancy. Far underneath he saw the clearing, and two airplanes on the tarmac, the aviators looking like beetles from that height. He looked out to sea and saw no signs of the fleet.

"You have heard of St. Simeon Stylites, Yankee?" purred Von Kettler. "The gentleman who spent forty years of his life upon a tall pillar, in atonement for his sins? It is His Majesty's desire that you spend, not forty years, but two or three hours up here, meditating upon his grandeur, before returning to earth. It is also possible that you will witness something of considerable interest. Look out to sea!"

Dick turned his head involuntarily. He heard Von Kettler's laugh, heard the snap of a switch—then suddenly he was alone in the void.

At that snap of the switch, everything had vanished from view behind him, the building, even the platform on which he stood. His feet seemed to rest on nothing. Yet below him he could still see the airplanes, and more being wheeled out.

A sense of extreme physical nausea overcame him. He reeled, then managed to steady himself. He, too, was invisible to his own eyes. Involuntarily he cried out. No sound came from his lips. He stood there, invisible in an invisible, soundless void.

For what seemed an unending period he occupied himself with endeavoring to obtain the sense of balance. Then, with a great effort, he managed to loosen the cords that bound his right arm to his side. A mighty wrench, and he had slipped them up above his elbow. His right lower arm was free.

He extended it cautiously, and his hand encountered a railing. Instantly he felt more at ease. He began moving slowly around in a widening circle, and discovered that the platform was enclosed. The further side was, however, open, and he began sliding forward, foot by foot, to locate himself. Once his foot slipped over the edge, and he drew back hastily. He felt on the other side, and discovered that he was upon what seemed a plank walk, perhaps a hundred and fifty feet above the ground, with no rail on either side, and some six feet wide.

Very cautiously he shuffled his way along it. It was solid enough, although invisible, but more than once Dick walked perilously close to one edge or the other. At length he went down on his hands and knees, and proceeded, crawling, until his movements were arrested by what was unmistakably a door.

The plank bridge, then, connected the top stories of two buildings, but what the second was, there was no means of knowing. The door was barred on the other side, and did not yield an iota to Dick's cautious pressure. Dick felt the frame. Beyond was glass, reinforced with iron on the outside, the latter metal forming a sort of lattice work. Cautiously Dick began to crawl up the rounded dome.

Foot by foot he made his way, clinging to the iron bars, until he felt that he had reached the point of the dome's maximum convexity. He wedged his feet against a bar and rested. Only now was it brought home to him that it would be impossible for him to find his way back to the plank.

A long time must have passed, for, looking out to sea,

he could see the squadron now, minute points on the horizon, exuding smudges of smoke. The dirigible was still invisible. The airplanes had either left the tarmac or had been wrapped in the gas-impregnated cloth, for both they and the aviators had vanished.

Suddenly Dick had an odd sensation that the iron was growing warm.

In another moment or two he had no doubt of it. The iron bar he clutched was distinctly warm; it was growing hot. He shifted his grasp to the adjacent bar and even in that moment the heat had increased perceptibly.

Suddenly there came a vibration, a sense of movement. Dick was being swung outward. The whole dome seemed to be dropping into space. He dug his feet and fingers under the hot rods, and felt himself sliding over on his back.

Back—back, till he was lying horizontally in space, and clutching desperately at the iron bar, which was growing hotter every moment.

The sliding movement ceased. It was as if the whole upper section of the glass dome had opened outward. But the heat of the bars was becoming unbearable, and gusts of hot air seemed to be proceeding from within.

Hot or not, Dick's only alternative was to work his way back to the stable portion of the dome, or to frizzle until he dropped through space.

Clinging desperately to the bars, he began working back, reaching from bar to bar with his right hand and dragging his feet, with the clanking chain attached, from bar to bar also.

How he gained the base of the dome he was never able afterward to understand. The heat had grown intolerable; his hands were blistering. Somehow he reached it. He rested a moment despite the heat. But to find the plank walk was clearly impossible. In another minute he must drop. Better that than to fry there like St. Lawrence on his griddle.

And then, just when he had resigned himself to that

last drop, there came an unexpected diversion. Almost beside him a window was hung back. A man looked out. Dick saw one of the workmen in the blue blouses, and, behind him, within the dome, what seemed like an empty room.

Dick was slightly above the man. As his head and shoulders appeared, he let himself go, landing squarely across his back. He slid down his shoulders through the open window into the interior of the dome.

The man, flung against the frame of the window by the shock, uttered a piercing cry. Before he could recover his stand, or take in what had happened to him, Dick had gained his feet and leaped upon him. His right hand closed upon his throat. He bore him to the floor and choked him into insensibility.

Chapter 11: In the Laboratory

Not until the man's struggles had ceased, and he lay unconscious, panting, and blue in the face, did Dick release him. Then he looked about him.

Save for the workman, he was alone in a rotunda, open to the sky, and, as he had supposed, the whole upper portion of the dome had been flung back, leaving an immense aperture into which the sun was shining, flecking the interior with shafts of light. The temperature, despite the opening of the dome, must have been in excess of a hundred and twenty-five degrees.

There was nothing except an immense central shaft, up which ran a hollow pole of glass, cut off by the invisible paint at the summit of the dome. The inside of this glass pole was glowing with colored fires, and it was from this that the intolerable heat came, though its function Dick could not imagine.

One thing was clear: It was growing hotter each moment. To remain in that rotunda meant death

within a brief period of time.

And there was no way out! Dick glared around him, searching the glass walls in vain. No semblance of a stairway or ladder, even. Yet the workman must have entered by some ingress—if only Dick could discover it!

He began running round the interior of the dome in the brilliant sunshine, searching frantically for that ingress. And it was growing hotter! The sweat was pouring down his face beneath the invisible garment.

Dick was vaguely aware that the silence switch had been thrown in the room, for his feet made no sound, but the knowledge was latent in his mind. Two or three times he circumnavigated the interior of the dome, like a rat in a trap.

Then suddenly he saw a section of the flooring rise in a corner, and a workman in a blue blouse appear out of the trap door.

He stood there, his face muscles working as he

shouted for his companion, but no sound came from his lips. He looked about him, and saw the unconscious man beside the window. He started in his direction.

With a shout, Dick hurled himself toward him. And he checked himself even as he was about to leap. For he realized that the second workman neither saw nor heard him.

Yet some subconscious impression of danger must have reached his mind, for the workman stopped too, instinctively assuming an attitude of defense. Dick gathered a dozen links of his wrist-chain in his right hand, leaped and struck.

The workman crumpled to the floor, a little thread of blood creeping from his right temple.

It was the thing upon which Dick looked back afterward with less satisfaction than any other, leaving the two unconscious men in that room of death. Yet there was nothing else he could have done. He ran to the trap, and saw a ladder leading down. In

a moment he had swung himself through and closed the trap behind him.

The material that lined the walls below must have had almost perfect insulating qualities, for the temperature here was no hotter than in the Bahamas on a hot summer day. Dick scrambled down the ladder and found himself in a machine-shop. Nobody was there, and tools of all sorts were lying about, as well as machinery whose purpose he did not understand. A pair of heavy pliers and a vise were sufficient to rid Dick of his wrist and ankle chains in a minute or two. With a knife he slashed the cords of invisible stuff that bound him. He stood up, cramped, but free.

He picked up an iron bar that was lying loose on a table beside a machine, and advanced to the staircase in one corner of the shop. As he approached it, another workman came running up.

Dick stood aside in an embrasure in the wall partly occupied by a machine. The man passed within two feet of him and never saw him. Only then did Dick quite realize that he was actually invisible.

The moment the man had passed him, Dick ran to the staircase. He descended one flight; he was half way down another when a yell of pain and imprecation came to his ears. He knew that voice: it was Luke Evans's!

With three bounds Dick reached the bottom of the stairs. He saw a large room in front of him. No mistaking the nature of this room; it was an ordinary laboratory, fitted out with the greatest elaboration, and divided into two parts by paneling. And sight and sound were on.

In the part nearer Dick three men were grouped about a large dynamo, which was sending out a high, musical note as it spun. Levers and dials were all about it, and above it was the base of the glass tube that Dick had seen above. In the other part were five or six men. Three of them were testing some substance at a table; three more were gathered about old Luke Evans, whose silver chains had been removed and replaced by ropes, which bound his limbs, and also bound him to a heavy chair, which seemed to be affixed to the ground. One of the three

had a piece of metal in a pair of long-handled pliers. It was white hot, and a white electric spark that shot to and fro between two terminals close by, showed where it had been heated.

Dick started; he recognized one of the three men as Von Kettler. He moved slowly forward, very softly, his feet making no sound on the fiber matting that covered the floor.

"Did that feel good, American swine?" asked Von Kettler softly, and Dick saw, with horror, a red weal on the old man's forehead. "Now you are perhaps in a more gracious mood, Professor? The unknown isotope in that black gas of yours—you are disposed to give us the chemical formula?"

"I'll see you in hell first," raved old Luke Evans, writhing in his chair.

Von Kettler turned to the man holding the white-hot metal, and nodded. But at that moment a door behind Evans's chair opened, and Fredegonde Valmy appeared in the entrance. Von Kettler turned hastily,

snatched the pliers from the man's hand, and laid the metal in a receptacle.

But the girl had seen the action. She looked at the weal on Luke's forehead, and clenched her hands; her eyes dilated with horror.

"You have been torturing him, Hugo!" she cried.

"Freda, what are you doing in here? Oblige me by withdrawing immediately!" cried Von Kettler.

"Where is Captain Rennell?" the girl retorted. "I will know!"

"He is upstairs, watching the approaching Yankee fleet, and waiting to see its destruction," returned the other.

"You are lying to me! He has been killed, and this old man has been tortured!" cried Fredegonde. "I tell you, Hugo Von Kettler, you are no longer a half-brother of mine! I am through with you!"

"Unfortunately," sneered Von Kettler, "it is not possible to dispose of a family relationship so easily."

"It is cheap to sneer," the girl retorted. "But you sang a very different song when you were in the penitentiary, in terror of death, and you begged me to come and throw you the invisible robe through the bars. You promised me then that you would abandon this mad enterprise and come away with me. You swore it!"

"I have sworn allegiance to my Emperor, and that comes first," retorted Von Kettler. "Oblige me by retiring."

"I shall do nothing of the sort," cried the girl hysterically. "When you used me as a tool in your enterprises in Washington, you played upon my patriotism for my conquered country. I thought I was undertaking a heroic act. I didn't dream of the villainy, the cold-blooded murder that was to be wrought."

"You've kept me here virtually a prisoner," she went

on, with rising violence, "an attendant upon that old madman, your Emperor, and his sham court, while more murder is being planned. Where is Captain Rennell, I say?" She stamped her foot. "I demand that he and this old man be set at liberty at once. Hugo," she pleaded, "come away with me. Don't you see what the end must be? This is no heroic enterprise, it is wholesale murder that will arouse the conscience of civilized mankind against you! Order that the vortex-ray be turned off," she went on, looking through the opening in the partition toward the dynamo. "That gas—you cannot be so vile as to send it forth again, to destroy the American ships?"

"My dear Freda," retorted the young man coolly, "the vortex-ray is already charged with the gas, and at a height of twenty thousand feet it is now creating a vacuum that will send the gas upon the wings of a hurricane straight up the Atlantic seaboard. It will obliterate every living thing on board the battleships, from men to rats, and this time we mean to reach New York.

"As for that swine Rennell," he went on, "you heard

His Majesty announce his intention of sending him back to Washington with the information of our irresistible power. Of course I know you are in love with him, and that these qualms of conscience are due to that circumstance."

But Dick hardly heard the latter part of Von Kettler's remarks. Suddenly the significance of the dynamo and the superheated room above had come home to him. He had read of such a project years before, in some newspaper, and had forgotten about it until that moment.

By sending a high-tension current almost to the limits of the earth's atmosphere, the article had said, a vortex or vacuum could be set up which would create a hurricane.

The tremendous pressure of the in-rushing air would make a veritable cyclone, which, taking the course of the prevailing winds, would rush forth on a mission of widespread disaster.

And on this hurricane would go the deadly gas,

infinitely diluted, and yet deadly to all life in its infinitesimal proportion to the atmosphere.

And the American fleet was now approaching the Bahama shores.

Dick forgot Luke Evans, everything else, as the significance of that mechanism in the next room came home to him. He ran like a madman through the space in the partition, and, raising the bar aloft, brought it thudding down upon the dials, twisting and warping them.

He struck at the hollow pole, but, glass or not, it defied all his efforts. He seized a heavy lever and flung it into reverse—and two others.

Yelling, the three attendants broke and ran. Out of the laboratory the six came running, collided with the three. Behind them Dick could see Fredegonde Valmy, a knife in her hand, slashing at Luke Evans's bonds.

Dick swung his bar and brought it crashing down on a head, felling the man like a log. He saw Von Kettler

pull one of the glass rods from his pocket and fire blindly. The discharge struck a second attendant, and the man dropped screeching, his clothes ablaze.

Somebody yelled, "He's there! Look at his eyes!" and pointed at Dick's face.

Dick leaped aside and swung the rod again, felling a third man. The others turned and ran. Von Kettler in the van, broke through the door behind Luke Evans's chair, and disappeared.

Dick ran back to where the old man was standing beside the girl, the discarded ropes at his feet. He flung his hood back. "Luke, don't you know me?" he shouted.

It was creditable to Luke Evans's composure that, though Dick must have presented the aspect of nothing more than a face floating in the air, he retained his composure.

"Sure I know you, Rennell," replied the old man. "And you and me's going to best them devils yet."

"But the fleet—it's approaching Abaco," Dick cried.
"I've got to warn them."

Fredegonde seized him by the arm.

"Come with me," she cried. "If they find you here, they'll kill you."

Dick hesitated only a moment, then followed the girl as she dashed for another door on the same side of the laboratory as that by which Von Kettler and his men had fled. They dashed down the staircase, and a corridor disclosed itself at the bottom. The girl stopped.

"There is a private way—the Emperor's," she panted. "He had it constructed—in case of necessity. I got the keys. I was planning—something desperate—to stop these murders; I didn't know what."

Dick seized her by the arm. "What keys?" he demanded. "The key to the place where President Hargreaves is?"

"Yes, but—"

"We must get him. Where is he?"

"In a cell beneath the throne room. That's overhead. But they'll catch us—"

"Which is the key?" asked Dick.

The girl produced three or four keys, fumbled with them, handed one to Dick. "This way!" she cried.

They ran along the corridor. Two guards appeared, moving toward them under the electric lights. At the sight of the girl running, and Luke Evans, they stopped in surprise.

Dick had pulled the hood back over his head. He ran toward them, wielding the iron bar. A mighty swing sent the two toppling over, one unconscious, the other bruised and yelling loudly.

"Here! Here!" gasped Fredegonde, stopping before a door.

Dick fitted the key to the lock and turned it. Inside, upon a quite visible bed, sat President Hargreaves, unchained. He looked up inquiringly as the three entered.

"Mr. President," said Dick, throwing back his hood, "I'm an American officer, and I want to save you. There's not much chance, but, if you'll come with me —"

Hargreaves got up and smiled. "I'm not a military man, sir," he answered, "but I'm ready to take that chance rather than—"

He did not complete the sentence. Shouts echoed along the corridor behind them. Dick replaced his hood, handed the keys back to the girl. "Take Mr. Hargreaves to any place of temporary safety you can," he said. "And Mr. Evans. I'll hold them!"

"It's right here. This door!" panted the girl, indicating a door at the end of the passage.

The three ran toward it. Dick turned. Five or six

guards with Von Kettler at their head, were running toward him. They saw the three fugitives and set up a shout.

Dick had a quick inspiration. He dashed back into the cell, seized the light bed, and dragged it through the doorway into the passage, just in time to send Von Kettler and two others sprawling. He brought down the bar upon the head of one of them, shouting as he did so.

Then he became aware that the passage was flooded with sunshine. Fredegonde had got the door open.

He darted back, passed through in the wake of the three, and slammed it shut. Fredegonde turned the key. Instantly Dick found himself with his three companions upon the prairie. Not a vestige of the buildings was apparent anywhere, except for the patches of brown earth.

Chapter 12: Von Kettler's End

Fredegonde took command, repressing her agitation with a visible effort. "They cannot break down that door," she said, "and they dare not ask for another key. It will take them a minute or two to go back and reach us around the building. But there may be a score of people watching us. Let us walk quietly toward the thickets. If I am present, they will not suspect anything is wrong."

But Dick stood still, driven into absolute immobility by the conflicting claims of duty. For overhead, high in the blue, was an American dirigible.

And at his side was the President of the United States. One or other of them he must sacrifice.

He chose. He ran forward without answering. Those squares of brown earth, set side by side, were the airplane hangars, and he meant to seize an airplane, if he could find one beneath its coat of invisibility, and fly to warn the dirigible and the fleet.

A curious wind was blowing. It seemed to come swirling downward, as no wind that Dick had ever known. It was growing in violence each moment, beating upon his face.

As he ran, he was aware of Luke beside him. He heard shouting all about them. Luke had been seen. Not only Luke, but Hargreaves, who was running after Luke, with Fredegonde trying in vain to change his intentions. At the edge of the first brown patch Dick collided violently with the wall of the invisible hangar, and went reeling back. The shouts were growing louder.

"Wait!" gasped Luke Evans. He had something like a large watch in his hand. He held it out like a pistol, and from it projected a beam of the black gas.

Then Dick remembered Colonel Stopford's words: "He showed me a watch and said the salvation of the world was inside the case. I thought him insane."

Insane or not, old Luke Evans had concealed the tiny model of the camera-box to good purpose. As he

swept the black beam around him, the whole mass of buildings sprang into luminosity, the figures of a score of men, grouped together, and advancing in a threatening mass, some distance away—and more.

Two airplanes, standing side by side upon the tarmac, just in front of the hangar—not mere pursuit planes, but six-seaters, formidably armed, with central turrets and bow and rear guns, and propellers revolving.

Two mechanics stood staring in the direction of the little group.

"I'm with you," gasped Hargreaves. "I'm not a military man, but I've got fighting blood, and I come of a fighting race."

Dick leaped and once more swung the iron bar. The nearer of the two mechanics went down like lead, the second, seeing his companion bludgeoned out of the air, turned and ran.

Dick shouted, pointing. Fredegonde jumped into the plane, and the President scrambled in behind her. The

group, dismayed by the black beam, which Luke Evans was now turning steadily upon them, had halted irresolutely. But suddenly a head appeared, moving swiftly through the air toward the plane. It was Von Kettler, with hood flung back, the face distorted with rage and fury.

At his yells, the whole crowd started forward. Dick leaped into the central cockpit, swung the helicopter lever. Something spitted past his face, and a long streak appeared on the turret, where the gas-paint had been scored. But he was rising, rising into that increasing wind....

He heard a yell of triumph behind him. And that yell of Von Kettler's was his undoing. There is the telepathy between close friends, but there is also telepathic sympathy between enemies, and in an instant Dick understood what that shout of triumph portended.

He was rising into the line of magnetic force that would anchor his airplane helplessly, and leave it to be jerked down and held at Von Kettler's mercy.

He released the helicopter lever and opened throttle wide. For an instant the heavy plane hung dangerously at its low elevation, threatening to nose over. Then Dick regained control, and was winging away toward the sea, while yells of baffled fury from behind indicated the chagrin of his enemies.

He glanced up. Thank heaven the dirigible had not approached the trap. It was apparently circling overhead. Of course the observers had seen nothing, had no conception that the headquarters of the Invisible Empire lay below.

And yet it seemed to be drifting aimlessly back toward the fleet—erratically, as if not under complete control. And Dick could see the ships about a mile offshore, apparently drifting too. They were moving as no American squadron ever moved since the day the first hull was launched, for some of them, turned bow inward toward others, seemed upon the point of collision, while others were lagging on the edge of the formation, as if pointing for home.

Then suddenly the awful truth dawned upon Dick. The

occupants of ships and dirigible alike had been overcome by the deadly gas.

Dick banked, turned, leaned forward and shouted to Luke Evans, and, when the old man turned his head, indicated to him to sweep the tarmac with his ray.

The thread of black, broadening into a truncated cone, revealed nothing save the luminous outlines of the buildings. Apparently the tarmac was deserted. It was queer, too, that the silence of the night before was gone. Dick shouted again, to assure himself of what he knew already, and heard his own voice again.

Something had happened, something unexpected—or perhaps the crew of the Invisible Emperor, satisfied with the effects of the deadly gas, had not thought it necessary to go to any further trouble.

Suddenly Dick discovered that he was almost within the circle of the line of magnetic force. Hurriedly he threw over the stick and kicked rudder. It was not till he was again approaching the seashore that it occurred to him that the force, too, was not in

operation.

He opened throttle wide and shot seaward. He must ascertain what had happened, and, if not too late, give warning without delay.

Then suddenly the vicious rattle of gunfire sounded in Dick's ears, and, materializing out of the sky, came Von Kettler's face. Startled for an instant, Dick quickly realized that it was Von Kettler in his plane, with his hood thrown back.

And Dick realized that his own hood was thrown back. Two faces and nothing else, were the whole visible setting for battle.

But that look upon Von Kettler's face was even more demoniacal than before. Mad with rage at the prospective escape of his prey, and infuriated by his half-sister's appearance in the plane, Von Kettler had thrown all caution to the winds. In his insane hatred he was prepared to shoot down Dick's plane and send Fredegonde to destruction with it.

If Dick chose to replace his hood he would have the madman at his mercy. And, if he had thought about it, he would have done so, with Fredegonde sitting behind him. But the idea did not enter his mind. Consumed with rage almost equal to Von Kettler's, he only saw there the face of one of those who had inflicted an unspeakable outrage upon the President of his country.

The memory of old Hargreaves, chained before the mock-Emperor's throne, enraged Dick more than the holocaust of lives taken by the assassins.

He shouted a wild answer to Von Kettler's challenge as his plane sped by, and banked. At that moment there came a roaring concussion that shook the plane from prop to tail.

Dick turned his head. Somehow, President Hargreaves had contrived to get the rear gun into action, and now he was staring at it as if he could not believe that he had fired it.

And that action heartened Dick wonderfully. As Von

Kettler's face appeared again, he loosed his turret gun in a sweeping blast, and heard Von Kettler's gun roar futilely.

Again they crossed each other's path, and again and again, two faces, only able to gauge roughly the position of their planes. Neither man had succeeded in injuring the other.

Once old Lake turned his black ray upon Von Kettler, and for a moment the plane stood out luminously in the blackness, but Dick leaned forward and yelled to the old man to desist.

And once Dick looked back and saw Fredegonde crouched in her cockpit with eyes wide with terror. And yet he read in her eyes the same determination she had expressed in the laboratory. She was through with her half-brother.

All this while the wind had been increasing, making it difficult to maneuver the heavy plane; but now, of a sudden there came a dead lull, and then, with a whining sound, the wind rushed in again.

But this was a wind still more unlike any that Dick had ever known. A mighty gale that revolved circularly, but downward too, like a vortex, catching the plane and sweeping it into an ever tightening circle.

A man-made gale, upon whose wings the poison gas would spread northward again, carrying unlimited destruction with it. Dick fought in vain to free himself.

He was revolving as in a whirlpool, and it required the utmost presence of mind and watchfulness to hold the plane steady. Round and round he spun—and then, suddenly, out of the void materialized Von Kettler's face.

Von Kettler, helpless too, was spinning round upon the opposite side of the vortex. Thus each airship was upon the tail of the other, and it was a matter of chance which would get the other within the ringsights of the turret gun.

Von Kettler was so near that his shouts of fury came fitfully to Dick's ears as the wind carried them. Dick,

working the controls, knew that not for an instant could he direct his attention from them in order to fire his gun, and the moment Von Kettler attempted to do so, he was doomed.

Round and round, struggling, battling in vain—and once more the concussion of the rear gun shook the plane. And a shout from the President reached Dick's ears.

Dick turned his head for an instant, long enough to see Von Kettler spinning down through the vortex. And he was going down afire. President Hargreaves, "no military man," had got him, the second time he had ever aligned a gun-barrel upon a target.

"Bravo, sir, bravo!" Dick shouted.

And desperately he flung the stick forward and nosed down.

No gale, man-made or heaven-made, could carry on its wings three-quarters of a ton of armored, turreted airship. Swirling like a leaf, the plane broke through

the clutch of the blast. Instantly it grew calm. Outside that vortex, hardly a breath of air was stirring. It was as if the whole fury of the air was concentrated within that circle.

The ground came rushing up. Once more Dick tried to head seaward. With flying speed lost, he was calculating the exact moment in his downward rush when he could hope to resume control. Would that moment come before he crashed?

At less than a hundred feet he partly regained control. For a moment the plane seemed to fly on an even keel. Then her nose went down as her speed slackened. And this time there was no salvation.

Working desperately to save her, Dick saw the ground loom up before him. He heard the crash as the plane broke into splintering ruin ... he had a last vision of old Luke clutching his precious watch: then everything was dissolved in darkness....

Chapter 13: You Can't Down the Marines

"He's pulling out of it! Keep it up, Gotch!"

Dick heard the words and opened his eyes. He stared in amazement at the faces about him. Honest American faces under tropical helmets and above a uniform that he had never expected to see again. It couldn't be real. And yet it was. One word broke from his lips:

"Marines!"

"He's got it. Don't let him slip, Gotch.", grinned one of the friendly faces, and the man named Gotch, who presumably had some qualifications for his job, continued what was meant to be a gentle massage of the nerve centers along Dick's spine.

"I'm all right." Dick muttered, beginning to realize his surroundings. He was lying on a strip of prairie near the beach, on which the waves were breaking in low ripples about a motorboat that was drawn up.

He sat up. The world was swimming about him, but he seemed to have no broken bones. Not far away was the wrecked plane, an incongruous mass of streaks where the fabric had ripped through the gas-paint. "Where are the others?" Dick muttered.

Then he was aware of Fredegonde Valmy lying with a white face under a shrub. Her eyes were open, and turned toward him.

He heard Luke Evans's voice. The old man hobbled round from Dick's back, one arm in a bandage.

"She's hurt rather bad, Rennell, but we won't know how bad till we can get her away," he said. "You've been lying here about an hour, since we crashed. President Hargreaves made them take him to the fleet in the other motorboat to see what he could do. He's assumed command.

"You see, Rennell, that damn gas caught the fleet and put pretty near every man out of commission for good. But these fellows wasn't going to give up. So, since all their officers were gone, they took two of the

boats and their arms and equipment, and came ashore to settle accounts. And they won't believe there's anybody on the island or any buildings. And I can't make 'em believe it. God, Rennell, those invisible devils may attack us at any moment. I don't understand what they're waiting for."

Gotch spoke: "We know you're Captain Rennell, sir. And this gentleman, we know him too, but he seems a bit queer in his head. Talking of the Invisible Emperor's headquarters on this island, a mile or so inland. The only invisible thing we've found is that piece of a garment we pulled off you."

"I broke my watch ray machine in the fall, and I can't make them believe, Rennell," almost wept old Evans. "Tell them I'm not crazy."

Dick got upon his feet with an effort, staggered a little, then made his way to Fredegonde. He kneeled down beside the girl. She was conscious, and smiled faintly, but she could not speak. He pressed her hand, rose, and came back. "Mr. Evans is not crazy," he said. "The headquarters of the gang is over there." He

pointed. "Didn't President Hargreaves tell you?"

"He was kind of incoherent, sir." The marines looked at one another, wondering. Was Captain Rennell crazy too?

"We've had scouts out through the jungle, sir. There's nothing within five miles of here. They had a clear view through to the sea from the top of a hill."

"I've been there." Dick spoke with conviction. "I must tell you they've got devices that make them practically irresistible. That gas and other things. And they're invisible. But if you boys are willing to follow me, I'll lead you. It means death. I don't know what they're waiting for. But—are you willing to follow me?"

"We'll follow you, sir"—after a pause, during which Dick read in their eyes the desire to humor a crazy man. "We'll follow to hell, sir—if that gang's really there."

"Take your arms, then!" Dick pointed to the stacked

rifles.

A minute later the twenty-odd Marines, forming an open line that extended from one side of the clearing to the other, were on their way toward the headquarters of the gang. And Dick, leading them, though his head was reeling, felt as if his own reason was slipping from him. Had he only dreamed all this? Was it possible that the headquarters of the Invisible Emperor existed on this desolate prairie? If it was true, why had they suddenly become silent, inert? Why had they not long ago wiped out these few Marines? And the gale—was it now sweeping northward on its mission of destruction?

Half an hour passed. Then the brown patches of the foundations came into view upon the open ground. Here were the hangers, here was the central building with the Emperor's headquarters. And nothing was visible, nothing stirred, yet at any moment Dick expected the rattle of machine-gun bullets or some more terrific method of destruction.

"Halt!" The line stood still. "I am going forward ahead

or you. You'll follow at a distance of twenty paces. When you see me stop, feel for the door in the wall, and if I disappear, follow me. You understand?"

The Marines assented cheerfully. No harm in humoring this poor devil of an officer who had crashed and lost his wits. Like Luke Evans, shambling up through the line to Dick's side. Dick advanced. At any moment now the concentrated fire of the Emperor's men should blast them all to smithereens. Nothing happened.

And it was no dream, for Dick's outstretched hand encountered the exterior wall of the building. He had gauged his way accurately, too, for a step or two brought him to the door. He stepped inside. He was inside the private door that led to the Emperor's quarters, through which he had passed with Fredegonde, Hargreaves, and Luke Evans in their flight. It had been broken down, contrary to the girl's predictions, and the deserted passage within was perfectly visible to them all.

Stupefied, the Marines bumped and jostled with each

other as they crowded in. If they had been anything but Marines, their own heads might have been turned at the discovery of this sudden materialization of a building out of nothingness.

Being Marines, they only grinned sheepishly, and followed along the corridor.

The first human being they saw was one of the guards, in a black tunic. He was leaning against a wall, and he was a human being no longer. He looked as if he was asleep, but he was stone dead, with a placid look on his face.

Two more dead guards lay across each other, with smiles on their faces: and there was a workman in a blue blouse who had been in a tremendous hurry to get somewhere, from his appearance, and had never got there. He had fallen asleep instead, and never wakened.

Dick found a stairway and led the way up. He thought it ran up to the laboratory, but, instead, the room into which he emerged was the ante-room of the Invisible

Emperor's audience hall. Six dead guards lay in a heap in front of the curtain, and they had died as unconcerned as their fellows, to judge by the pacific expressions on their faces.

Dick passed through into the throne room. The Marines, behind him, for the first time uttered exclamations of awe—of pity.

The terrific scene that met Dick's eyes would be burned into his brain till his last day.

Upon his throne, head flung back, sat the Invisible Emperor, his features set in a sardonic leer of death. And all about him, some sitting, some lying, supporting one another, were his court, officers in black uniforms with the silver braid, and women in court dress. And all were dead too. But they had not known they had died. They had fallen asleep—upon the instant that their own volatile gas reached them.

"I guess that's the explanation, sir," said old Luke Evans. "Those devils made the whirlwind and charged it with the gas. But when you reversed that lever, you

reversed the process. Instead of projecting the force outwardly, you made a suction, and every atom of the gas that hadn't travelled beyond the radius came rushing back and filled the building. If we'd entered a half-hour later, we'd have been dead ones ourselves, but the gas was volatile enough to disperse through the chinks and crannies. Anyway, it's all over now."

Yes, it was all over, Dick thought, as he sat in his deck chair upon the cruiser that was bearing him northward. The menace to world government had been destroyed and with it all who had been behind it. There would be a new order in the world, a new and kindlier government. Men would feel closer to one another than in the past. Half the personnel of the fleet had escaped the invisible death, and only one cruiser and the dirigible had been lost in the confusion. There would be a great reception when they put into Charleston.

Dick bent over Fredegonde, who was asleep in her chair beside him. The ship's surgeon had promised recovery for her. She shouldn't suffer for her half-voluntary part in the business, Dick said to himself. It

was going to be his task to help her to forget.

#53 Prisoners On The Electron, By Robert Henry Leitfred:

Fate throws two young Earthians into desperate conflict with the primeval monsters of an electron's savage jungles.

Aproximate word count:

Bigotry: overt antiblack racism towards the end

Warnings:

the gaping mouth jerked

- - -

The blood-red glow of a slanting sun bathed the towers of New York's serrated skyline, then dropped into a molten sea beyond the winter horizon. Friday, the last day of Jupiter, the thirteenth month of the earth's new calendar, had drawn to a close. In a few hours the year of 1999 would end—at midnight, to be exact.

Far below the towers stretched well lighted canyons teeming with humanity. At an upper level where once the elevated trains had roared and rumbled in an antiquated period long past, an orderly mass of workers and shoppers was borne at an incredible speed from lower Manhattan to towering apartments that stretched northward to Peekskill. The northbound traffic was heaviest at this hour and the moving sidewalk bands were jammed to their capacity.

Street cars, now obsolete, had vanished from the streets under the new order of things as had also passenger cars, taxis and trucks. Speed

predominated. Noise had practically been eliminated. Except for the gentle throb of giant motors far underground, the city was cloaked in silence.

At regular intervals along the four-speed moving bands that formed the transportation of the great metropolis, huge circular shafts of steel mounted upward beyond the roofs of the tallest buildings. Within these shafts, swift elevators carried passengers who lived in the outlying districts to the level of the station platforms of the interstate operating transport planes.

Close to the entrance of one of the steel shafts stood a young man a little above medium height. His deep-sunken eyes were those of a dreamer, a searcher. They were the eyes of a man who had seen strange and startling things. At present they were staring into the pulsing wave of humanity flowing northward on the endless steel bands beyond the platform.

Quite suddenly they lighted with pleasure as a man and a girl detached themselves from the swift moving river of people and hurried to the spot where he

stood.

"Think we were never coming?" Karl Danzig's eyes were much like those of Aaron Carruthers. Just now they sparkled with suppressed excitement.

Aaron Carruthers smiled in turn. "No, Karl. Any man but you. I couldn't imagine you being late." He turned his attention to the slim, dark haired girl. "Nanette," he murmured, extending his hand, "I didn't think you'd come."

Dazzling white teeth caught the glow of the blue-white incandescents along the platform, and became under the bow of her red lips a string of priceless pearls.

"I had to come, Aaron. Karl has done nothing but talk of your amazing discovery. The experiment fairly frightens me at times especially when I recall the sad fate of your friend, the missing Professor Dahlgren. I wish you boys would give up the idea—"

"Nan, be still," broke in Karl, with brotherly rudeness.

Turning to Carruthers. "Everything all ready, Aaron?" he asked.

Carruthers nodded. "As far as humanly possible. The element of error is always present. I've checked and re-checked my calculations. I've augmented the vacuum tubes by installing three super-dimensional inverse power tubes." He clasped the girl's arm. "The street is no place to talk. Let's go to the laboratory."

They crossed the moving bands by an overhead bridge and cut down a narrow canyon to the entrance of a crosstown series of bands. They stepped onto the first band. The speed was moderate. From there they moved over to the second. Carruthers was in a hurry. He guided the girl and her brother across the third to the fourth band of moving steel.

Buildings slid past them like wraiths in the electric light. They felt no winter chill, for the streets and platforms were heated by a constant flow of warm air from slots ingeniously arranged in the band of swift moving metal upon which they stood. Within a few minutes they had arrived at their destination. Quickly

they reversed their path across the moving bands until they reached the disembarking platform. A short distance from the station they came to the entrance of a huge tower building.

Carruthers nodded to the doorman and they were admitted into a marble hallway. A silent, unattended lift bore them swiftly to the seventy-fifth floor. Down a deep carpeted hallway they moved. Carruthers touched his door. It opened. He stood to one side as the other two entered.

Nanette cried with delight at the luxurious splendor of the place. "Why, Aaron, I never dreamed the night view could be quite so delightful! I do believe that if the horrid government had not taken down that little Statue of Liberty and substituted the Shaft Triumph in its place, that I could easily see her fingers clasping the torch she was reputed to hold.

"Progress, dear girl," shrugged Carruthers, holding out his hands for her cape. "By the way, have you folks eaten?"

"Not in a week," said Karl.

"Von Sternberger's food tablets," informed the girl.

Carruthers nodded. His deep-set eyes regarded them appraisingly. "Any ill effects?"

"None whatever," spoke Danzig. "Neither of us have the slightest craving for food."

"Good. Did you bring any with you?"

"A whole carton."

"Then I guess we're already to make the experiment. You're sure. Nanette, that you're not afraid of...."

"Don't be silly, Aaron. I haven't grown up with Karl for nothing. He's always used me for the disagreeable end of his crazy experiments. And besides," she smiled on both men. "I have a woman's curiosity for the unknown."

"Very well," said Carruthers gravely. From his

waistcoat pocket he took a ring of keys and inserted one of them into the lock of an immense steel door. "Our laboratory," he announced, swinging the door wide.

Nanette's eyes opened wide at the paneled whiteness of the room. Most of the far side was taken up with electrical machines, dynamos, generators and glass enclosed motors of an advanced type. Overhead, concealed lights made the room as light as day. A heavy glass railing shielded a square spot in the exact center of the room.

"What's that for?" asked the girl.

Danzig and Carruthers both regarded it with troubled eyes. It was Carruthers who spoke.

"That railing marks the spot where Professor Dahlgren stood when the rays of our atomic machine struck him."

"You mean," breathed the girl, "that he never moved from that spot after the rays touched his body? What

happened?"

Karl had already divested himself of his coat and was checking the copper cables leading into a strange machine.

"It was rather curious," remarked Carruthers. "The moment the ray touched him his body began to dwindle. But evidently he suffered no pain. As a matter of fact his mind remained quite clear."

"How did you know?"

"As he dwindled in size," continued Carruthers, "he shouted warningly that the rays had become confused and for us to cut the switch. But the warning came a fraction of a second too late. Even as my fingers opened the contact, his body dwindled to a mere speck and disappeared entirely from sight."

Nanette gazed with staring eyes at the ill-fated spot. Her face had grown steadily paler. "Oh, Aaron! It's awful! What do you suppose happened?"

Carruthers eyes glowed strangely. "I didn't exactly know at the time, Nanette. I'm not sure that I know even now. But I've got a theory and Karl has helped me to build a second machine to flash a restoring ray on the square spot. What will take place I cannot even conjecture."

"Let's get on with the experiment," interrupted Karl.
"Nanette can be shown later what she is to do."

Carruthers turned to Danzig. "All right. Karl. Draw up a chair to your machine. And you, Nanette, sit close to this switch. It's off now. To turn it on, simply push it forward until the copper plates slide into each other. To turn the current off, you pull sharply out. However, we aren't quite ready."

He shifted his position until he stood before a third machine slightly smaller than the other two. His fingers clicked a switch. The dial of the instrument glowed whitely.

"It's important," continued Carruthers, "that we first locate our interference. We have here, Nanette, a

common television receiving apparatus capable of picking up news and pictures from any corner of the globe. Ready, Karl?"

Danzig clicked on the switch before his own machine and turned one of the many dials mounted on the panel in front of him. A faint hum filled the room as the generator settled to its task.

Carruthers reached up and dimmed the overhead lights. A screen of what looked like frosted glass set in the wall glowed luminously. The interior of a famous broadcasting studio became mirrored in the glass screen. Into it stepped the master of ceremonies. He spoke briefly of the New Year's activities that would soon take place when the twenty-eighth day of Jupiter ended at midnight.

"Boston," said Carruthers. "Too near."

"Try Frisco," suggested Karl. "The tubes ought to be sufficiently heated by this time."

The dial whirled beneath Carruthers slender fingers.

The pictures framed in the frosted panel faded. Another took its place. San Francisco—an afternoon concert. Carruthers saw and listened for a moment, then moved thousands of miles out to sea.

Shanghai drifted into the panel, announcing in sing-song accents the weather reports. Following this came reports of various uprisings along the Manchurian border.

While yet the three listeners and watchers bent their heads toward the panel in the wall, a strange thing occurred. The silver frostiness of the screen became violently agitated with what looked like tiny sparks darting in and about each other like miniature solar systems. Shanghai faded from the picture. All that remained visible now was the jumbled mass of needle-pointed sparks of luminosity.

"Careful," warned Carruthers. "Slow up the speed of your reflector, Karl. There, that's better. Watch the meter reading. I'm going to step up the power of the dimensional tubes. Steady!"

From an invisible reproducer came a sharp, metallic crackling like machine-gun bullets rattling on a tin roof. The sparks on the screen became violently agitated, pushing around in erratic circles and ellipses. They glowed constantly in shades of bright green through the blues into the deep violets of the color scale.

"What do you read?" asked Carruthers.

"Point seven six nine," answered Karl.

"Shift it back towards the blue, about two points lower on the scale."

Danzig twisted two dials at the same time with minute exactness. "Point seven six eleven," he intoned.

"Hold it," ordered Carruthers. "Blue should predominate." He turned his eyes on the dancing sparks on the screen. They glowed now a deep indigo blue. "Lock your dials against accidental turning. We're tuned to the vanishing point."

Danzig rose to his feet. "What will we use?"

Carruthers looked hastily around the room. "Most anything will do." His eyes rested on a glass test tube. Quickly he rose to his feet and removed it from the wall rack. Then bending over the glass railing that enclosed the mysterious square he placed it on the floor. He turned now to the girl.

"Quiet, now, Nanette, and don't under any condition leave the chair. The path of the ray should pass within two feet of you, having a wide margin of safety. All right, Karl. Set the dials of the inverse dimensional tubes at point seven six eleven, and switch the power to the Roentgen tube."

Through the dimly lighted laboratory came a spurt of bluish flame that twisted and squirmed with slow undulations around the cathode electrode.

"Fine," enthused Carruthers, "The cathode emanations coincide exactly with the interference chart. Watch your meter gauges, Karl, while I switch to the atomic ray."

His fingers closed over a switch. The indigo points of flame bathing the electrode gathered themselves into a ring and began to revolve around an invisible nucleus located near the electrode. Carruthers studied the revolving flame for a moment, then switched off the television machine. It was no longer needed.

Carefully, for the atomic ray was still a mysterious force to Carruthers, he opened a small door in the panel and drew out the focusing machine. It was shaped very much like a camera except that the lens protruded several inches beyond the machine proper.

With infinite patience he made the final adjustments and moved away from the front of the lens. "Ready?"

Danzig nodded and threw on the full power of the inverse dimensional tubes. A low clear hum filled the quiet room of the laboratory. From the lens of the focusing machine shot a pale, amber beam. It struck the glass test tube squarely in the center and glowed against its smooth sides.

Carruthers reached across his own machine and turned the final switch. The amber beam emanating from the lens increased in intensity. And as it increased it took on a deep violet color.

Nanette cried out in muffled alarm. But even as Vincent raised his voice to quiet her fears the test tube suddenly shrunk to nothingness and vanished into the ether.

"Aaron!" whispered the girl, awesomely. "It ... it's gone!"

Carruthers nodded. Beads of sweat stood out upon his forehead. Would the returning ray work? He had made the test tube follow the same route as that taken by Professor Dahlgren. Both were gone. He clicked off the switch and the beam faded.

With a deliberate calmness that in no way matched the inner tumult brought on by the experiment, he turned the dials of the machine he and Danzig had worked out together. A second switch clicked under his fingers. From the lense of the focusing machine

shot the reverse atomic beam. As it struck the center of the square it turned a bright vermilion. For several seconds it played upon empty space, then the miracle unfolded before their eyes.

Something like a glass sliver reflected the beam. It grew and enlarged under their startled eyes until it had achieved its former size, then the power that had brought it back switched itself off automatically.

Together both men examined the test tube. It appeared in no way harmed, nor did it feel either warm or cold from its trip through the elements.

"It works!" marveled Danzig. "Let's try it again with something larger."

"I've got a better idea," said Carruthers, rising to his feet. He crossed the laboratory and went to another part of his rooms. Presently he returned holding a small pink rat in his hands. The rodent was young, having been born only a week before. "Now we'll see what happens."

"Oh, it's torture to the poor thing," burst out Nanette.

"It won't hurt it," growled Karl. "Aaron knows what he's doing."

Carruthers placed the little rat in the center of the square. It lay there, very quiet and unblinking. Again the switches clicked as the contacts were closed.

Came once more the beam of amber colored light followed closely by the violet. The rat dwindled to the size of an insect, then disappeared into space. The three watchers held their breaths. Carruthers' hand trembled the least bit as he threw on the switch controlling the animal's return to the world.

A vermilion shaft of light pierced the semi-darkened rooms. The animal had been gone from sight not more than a minute. Abruptly something grayish white unfolded in the reflector's beam. It rapidly expanded under three pairs of bulging eyes—not the small, pinkish rat that had disappeared but sixty seconds previous, but a full grown rat, scarred and tailless as if from innumerable battles with other rats.

As the current clicked off Aaron Carruthers bent forward. Too late. The rat scurried from the laboratory with a squeal of alarm. Carruthers returned to his seat before the atomic machine and sat down. His face was worried. Dark thoughts stormed his reason. The rat he had placed within the atomic ray had aged nearly two years during the minute it was out of mortal sight. Two years!

He pulled a pad from his pocket and calculated the time that had elapsed since Professor Dahlgren had vanished from that same spot. Nearly forty hours. That would mean....

Nanette stirred in her chair. "What happened to the little rat, Aaron?"

Carruthers, busy making calculations, did not hear the question.

She turned to her brother. "Karl, what's the meaning of this? The second experiment didn't turn out like the first one. What became of that little rat?"

"I don't know what happened, Nan," spoke Karl. "Now don't bother me with your silly questions. You saw the same thing I did."

Carruthers raised his head and spoke quietly. "That rat you saw materialize under the atomic rays was the same rat you saw me place within the square."

"But it couldn't be," protested the girl.

"Nevertheless," shrugged Carruthers. "It was the same animal—only it had aged nearly two years during the brief time interval it was off from our planet."

"It's preposterous," cried the girl.

"Nothing is preposterous nowadays, Nanette."

"That's the woman of it," spoke Karl. "Always doubting."

"You boys are playing tricks on me," retorted the girl sharply. "I shouldn't have come to your old laboratory."

Just because I'm a girl...."

"Don't," pleaded Carruthers, looking up from his pad of figures. "We're trying to solve the mystery underlying the forces which we have created." He replaced the test tube within the center of the square and returned to the atomic machine.

Through the twilight shadows of the room glowed the strange new ray. Faintly the generator hummed. Lights sparkled and twisted around the cathode in serpentine swirls.

"You needn't trouble to explain your silly experiment again," finished Nanette, rising abruptly to her feet. "I'm going home and dress for the New Year's party."

"Watch your switch like I asked you to," spoke Carruthers.

"Sit down," added Karl. "Don't put the rest of us in danger!"

"Oh-h-h!" gasped the girl as she inadvertently stepped

squarely into the atomic ray of amber-colored light.

Carruthers leaped impatiently to his feet. An inarticulate cry of horror froze upon his lips. Forgetful that he himself was directly in line of the atomic ray he lunged forward, his mind centering on a single act—to drag the protesting and now thoroughly frightened girl out of the path of the penetrating ray.

But even as he started forward Nanette tripped over the glass railing around the square. Carruthers moved quickly. Yet his movements were slow and ungainly as compared to the speed of the light ray. He saw the figure of Nanette decrease in size before his eyes, heard the muffled expression of alarm and fear in Danzig's voice; then the room suddenly began to extend itself upward with the speed of a meteor.

What once had been walls and bare furniture resolved themselves into a range of hills, then mountains. The twilight gloom of the room became a dark void of empty space that seemed to rush past his ears like a

moaning wind.

He had the sensation of falling through infinite space as if he had been propelled from the world and hurled out into the vastness of interplanetary space.

Something brushed against him—something soft and fluttering. He grasped it like a drowning man would clutch a straw. "Nanette!"

The name echoed and re-echoed through his mind yet never seemed to get beyond his tightly clenched lips.

He felt something cool close over his hand.

Instinctively he grasped it. Her hand. Together they clung to each other as they felt themselves being hurled through endless space.

The twilight changed swiftly to black night that rushed past the two clinging figures and enveloped them in a wall of silence. Then out of the mysterious fastness came the dull glow of what looked like a distant planet. It grew and enlarged till it reached the size of a silver dollar. Little pin-points of light soon began to appear on all sides of it, very much like stars.

Carruthers attempted to reassure Nanette that all was well, and they were out on the streets of the great metropolis. But even as he wrenched his tightly locked lips apart he saw that the shining disc far out into space was not what he had first thought it was—the earth's moon.

He shook his head to clear it of the perplexing cobwebs. What was the matter with his mind? He couldn't think or reason. All he knew was that he had erred. This strange planet looming in the sky held nothing familiar in markings nor in respect to its relations to the stars beyond it.

While yet he groped in the darkness for something tangible, his mind reverted to the girl at his side. She was clinging to him like a frightened child. He could feel the pressure of her body against his and it thrilled him immeasurably. No longer was he the cold, calculating young man of science.

How long they remained in state of suspension while strange worlds and planets flashed into a new sky before their startled eyes, Aaron Carruthers didn't

know. At times it seemed like hours, years, ages. And when he thought of the tender nearness of the girl he held so tightly within his arms, it seemed like a few minutes.

Gradually the sensation of speed and space falling began to wear off, as if they were nearing earth or some solid substance once more. The air about them grew heavier. Then all movement through space ceased.

Carruthers was surprised to find what felt like earth beneath his feet. For long minutes he stood there, unmoving, still holding possessively to the girl.

"Aaron!" The name came out of the void like a faint caress.

"Nanette."

Reassured of each other's presence they stood perfectly still, lost in the vast silence of their isolation.

Presently the girl spoke. "Oh, Aaron, I'm frightened!"

"There's nothing to be alarmed at, dearest." The endearing term came for the first time from the man's lips. As long as he had known Nanette Danzig, love had never been mentioned between them. If it had ever existed, the feeling had not been expressed.

"You shouldn't call me that, Aaron."

His voice sounded curiously far-off when he answered. "I couldn't help it, Nan. Our nearness, the strange darkness, and the fact that we are alone together brought strange emotions to my heart. At this moment you are the dearest—"

Bump, thump! Bump, thump!

"What's that noise?" breathed Nanette.

Carruthers turned his head to listen. To his ears came the pound of some heavy object striking the ground at well-regulated intervals.

Nanette, who had started to free herself from Carruthers violent embrace, suddenly ceased to

struggle. "Oh, what is it? What is it?" she whispered fearfully.

Carruthers sniffed the night air. A musky odor assailed his nostrils, strange and unfamiliar. "It's beyond me, Nanette. Let's move away from this spot. Perhaps we can find shelter for the rest of the night."

But the Stygian blackness successfully hid any form of shelter. Tired from their search they sat down.

"We might build a fire," suggested Carruthers, "only there doesn't seem to be any wood around. Nothing but bare rock."

"Perhaps it's just as well," spoke the girl. "The flames might attract prowlers."

"Maybe you're right," agreed Carruthers.

A silence fell between them. After a long time Nanette spoke.

"I don't suppose, Aaron, that anything I can do or say

will help matters any. I know that our being where we are is my own fault. I'm sorry. Truly I am."

"The harm is done," said Carruthers. "Don't say anything more about it."

Nanette pointed at the disc of light shining high in the heavens. "These stars are as strange to me, Aaron, as if I had never seen them before. Saturn is the evening star at this time of year. It isn't visible. Even the familiar craters and mountains of the moon look different. And it glows strangely."

"I'd rather not talk about it, Nan."

Nanette placed a hand upon his arm. "I'm not a child, Aaron. I'm a grown woman. Fear comes through not knowing. Tell me the truth."

"Let's sit down."

They sat upon the ground and both stared out at the night heavens that arched into infinity above them. Presently Carruthers took the girl's hand from his

arm and held it gently between his own. "You've guessed rightly, Nan. The orb shining upon us is not our moon. I'll try and make it clear."

The girl smiled reassuringly in the darkness. "I'm waiting."

"Strange as it must seem," began Carruthers, "you and I are still within the room of my laboratory. But we might as well be a million miles away for all the good it does us. Karl sits in his chair in the same position as when we disappeared in the violet glow of the atomic ray. His eyes are bulging with fear and horror. For days and days he'll continue to sit on that chair, his mind not yet attuned to what actually took place. What has happened? He doesn't know yet, Nan."

"Oh, it's incredible," sobbed Nanette.

"I know, but it's so obviously true that I won't even trouble to check my calculations." He pointed at the silver disc hanging low in the strange sky. "That, Nan, is not our moon. It is nothing more than a planetary

electron very much like the one we are on at the present moment. The firmament is filled with them. From where we sit we can see but the half nearest to us. The glowing portion is illuminated from distant light rays shot off from the nucleus of the atom itself. That atom is going to be our light and heat for weeks, months, perhaps years to come. We're prisoners on an electron, and as such we are destined to rush through infinite space for the remainder of our lives unless...."

"Unless what?"

Aaron Carruthers hesitated for a bare fraction of a second. "Karl!" he whispered. "Our lives depend on him. Time flies fast for us, Nan. Already it is growing light. But not on our earth. Karl still sits upon his chair staring incredulously at the miracle of our disappearing bodies. It will take weeks of time, as it affects us, for the initial shock to travel along his nerves to the center of his brain."

His voice shook with emotion quite contrary to his usual calm nature. "Oh, I know it's hard to understand, Nan. I was a fool to meddle with laws of

which I know so little compared to what there is yet to know."

"Then it's all true, Aaron. The little rat that came out from under the ray as an old rat was one and the same animal."

Carruthers nodded. "Time has changed in proportion to our size. We're moving so much faster than the earth that we must of necessity be bound to the universe of which we are now an integral part."

For a long time they remained silent, each immersed in dark, troubled thoughts. Nanette broke the silence.

"You don't suppose, Aaron, by any chance that Professor Dahlgren is still alive and on our planet?"

Carruthers shook his head negatively. "It's beyond human reason, Nan. He was lost in the ray for over forty hours. Translated into minutes he's been gone twenty-four hundred minutes. Since the mouse we placed within the light ray aged approximately two years in the space of one minute, Professor Dahlgren

would, if he were alive, be about four thousand, eight hundred years old."

Nanette rose abruptly to her feet. "Oh bother the figures. My head's swimming with them. It's getting light now, and I'm hungry."

"Eat one of your food tablets," suggested Carruthers.

"Please don't get funny," said Nanette. "Karl has them in his coat pocket."

"Hum-m-m!" coughed Carruthers, following her example by rising to his feet. "Looks as though we'd have to rustle our food. I've got nothing on my person but a knife, a pencil, a fountain pen and some pieces of paper. Nothing very promising in any of them."

At that moment the sky became fused with reddish light. Over the horizon appeared a shining orb. Far-away hills and valleys leaped into sight. Then for the first time Carruthers noted the high plateau upon which he had spent the night. Had they ventured a hundred yards farther during the night they would

have plunged into the rocky floor of a canyon a thousand feet below.

"Let's see if we can find a way down to the valley," he suggested. "If we get anything to eat it will have to come from trees. This plateau is barren of any form of vegetable matter."

They found a winding descent leading downward. It looked like a path that had been worn by the passage of many feet.

"Someone's been here before us," he exclaimed. "The ground is too well worn to be accidental."

"Look! Look!" pointed Nanette. Her face had become pale from the excitement of her discovery. "What is it, Aaron?"

Carruthers bent forward to examine the strange footprint. It was nearly two feet across and divided in the center, as if the animal that made it had but two toes.

"From the size of the tracks and the length of the animal's stride, I should say it was some form of an amphibious dinosaur long extinct in our own world."

"Are they dangerous?"

"It all depends upon the species. Some of them are pure vegetarians; others are carnivorous. The heavy tramping we heard during the night evidently came from the beast who left these footprints."

They had come upon the footprints where the path made a turn, leading into a dense growth of trees and underbrush. And as Carruthers knelt beside the path he heard a rustle as of something moving directly behind him. Wonderingly, he turned his head to trace the disturbance. But the woods seemed empty.

"Strange," he murmured. "Did you hear something moving in back of us, Nan?"

Nan shook her head. "You don't think we're in any danger from these beasts, do you?"

Carruthers said nothing for the moment. Instead, he

looked sharply in all directions and saw nothing.

"Let's push on till we come to some kind of a shelter. Perhaps we'll find people much like ourselves."

Down the path they hurried, glancing curiously right and left at unknown flowers and trees. A bird with brilliant feathers skimmed above their heads, uttering shrill cries. Other voices from the birds and animals in the woods took up the cry. The woods grew denser as they pushed into the unknown.

In the woods at their right a rodent squeaked as some larger animal pounced upon it. Presently they came to a pool of water roughly seventy feet across. While they knelt to quench their thirst they saw two young deer eyeing them from the far side. Soft feet pattered behind the kneeling couple. Carruthers half whirled as he rose to his feet and peered into the jungle behind him.

A blur of reddish brown vanished behind a tree. Man or animal Carruthers couldn't determine. He grasped Nanette by the arm and pulled her back to the path.

"Quick!" he whispered. "There's someone or something following us. I'm sure of it now."

Nanette's voice trembled slightly. "What is it, Aaron?"

"I don't know." He turned his head again. This time he saw the thing that was following. A low ejaculation of alarm escaped his lips. A gigantic ape! The mouth of the creature sagged grotesquely, revealing two rows of yellow fangs. And its orange colored eyes were burning coals set close together. Carruthers sucked in a deep breath.

"Run, Nan," he gritted. "I'll try and scare him away."

Simultaneously with the scream of fright from the startled girl, a huge mountain of grayish flesh and bones blocked the downward slope of the path. Carruthers paled as he turned and faced the new menace.

Coming directly toward them he saw an immense animal so great in size that it seemed to shut out the light. A prehistoric dinosaur! It came slowly and

leisurely, swinging its great red mouth from side to side. Other denizens in the woods, sensing the presence of the huge killer, fled in a panic of alarm. Their shrill cries increased the terror that froze the hearts of the two earth people.

Nanette clung to her companion in abject terror, unable to move. Her fear stricken eyes were wild and staring as the mountain of flesh pushed towards them.

The animal's long neck arched far in front of its body, and its long, pointed tail remained out of sight within the trees.

Carruthers backed off the path into the underbrush, dragging the girl after him. The jaws of the huge animal opened wide with anticipation. Lumberingly he turned from the path and followed. Trees crashed before its gigantic bulk. The woods became a bedlam of snapping branches.

The horrified scream of the girl ended in a gurgling sigh. She toppled to the ground in a dead faint.

Carruthers flung himself beside her crumpled body and gathered it into his arms. A quick glance he threw at the spot where he had last seen the gigantic ape. The animal was no longer there. It had disappeared.

The man's lips became a hard, straight line. Even as he straightened to his feet the leaves and branches of an overturned tree whipped his face. The red mouthed dinosaur was perilously near. So close that Carruthers could smell its great, glistening body. The odor was musky and foul.

Stumbling blindly he attempted to widen the distance between himself and his pursuer. But the hungry dinosaur pounded steadily on its course. There was no getting away from it. Its beady eyes sought out its prey and its keen smell told it exactly where the earth beings were.

On and on staggered Carruthers. The extra burden of the girl hampered his movements. Unseen roots tripped him time and time again. Each time he scrambled to his feet and picked up the unconscious

girl. Briars tore at his clothing and stung his hands.

The underbrush was thickening. A warm, dank smell clung to the vegetation now almost tropical in nature. Beads of sweat rolled down the man's forehead and into his eyes. But the horrible fear of those red, dripping jaws spurred him to renewed efforts.

He doubled to the left, hoping to throw the animal off his tracks. The undergrowth seemed to thin out at this point. Renewed hope flowed through the young scientist's blood. He stumbled on blindly, scarce watching where his feet were taking him. A sigh of relief came to his lips. Ahead of him he saw a clearing. His stride lengthened and he broke into a shambling run.

Then it was he saw, towering walls rising up on both sides of him—steep walls that he could never scale, even if alone. He tried to change his course, but the huge bulk of the pursuing dinosaur effectively blocked his path. There was no alternative but to push on and pray for an opening in the rugged cliffs.

Abruptly a sigh of despair escaped his lips. The walls of the canyon narrowed suddenly, and across it stretched a wall of bare rock. He realized too late that he had returned to the base of the plateau where he had spent the night. The grim, towering walls hemmed him in completely from three sides. At the fourth side bulked the dinosaur, coming slowly, ponderously.

Beady eyes peered down cunningly at the helpless man and woman. Confident now that its prey couldn't escape, it extended its huge bulk across the narrow canyon for a leisurely killing.

Carruthers glared at the monster with fear-distended eyes. In his heart he realized that there was no escape. He had no means of defense, no way to combat the huge monster but flight. And even that was now denied him.

Closer and closer inched the killer until its great, red mouth appeared like the fire box of a huge boiler. Hot breath fanned the man's cheek. The nauseous odor of the beast made his stomach wrench. He dropped to

his knees close to the inert figure of the girl and glared vengefully into the beady eyes.

The gaping mouth at the end of a long, supple neck jerked forward. Carruthers dragged the girl away just in time to escape the gnashing teeth. The dinosaur stamped angrily.

Once again Carruthers felt its hot breath beating upon his face. He cringed at the thought of this kind of death. No one would ever know how it happened. Not even his closest friend, Karl Danzig! What a mess things were. Why didn't the red mouth of the mighty dinosaur close over him and crush out life? Why must he kneel in torture?

From near at hand a piercing scream rang through the air. A harsh scream. A terrifying scream!

Carruthers raised his head. The dinosaur had twisted around to glare hatefully at the disturber of its meal. Other screams splintered the forest air. And as the kneeling man watched he saw the great red ape who had been dodging his footsteps a short time before,

slouch between the dinosaur's hulking body and the wall of the cliff. Behind it came others—black mammals with curving arms that dragged along the ground.

Their fangs were bared. They were in an ugly mood. Arriving in front of the dinosaur and less than four feet from the earth man and woman, the leader silenced its followers with a low growl and turned in concentrated fury upon the dinosaur. Its long arms drummed a throbbing tattoo upon its hairy chest.

The dinosaur bellowed protestingly against the attitude of the apes and gorillas. The ape leader protested with equal violence. The dinosaur shifted uneasily, wagging its heavy head from side to side. On all sides came deep growls from the mammals.

Carruthers watched all this display torn between doubt and fear. Which side would win? How could the apes and gorillas, huge as they were, hope to force the dinosaur away? But the apes were masters. This much was apparent. Inch by inch the dinosaur backed away, glaring vengefully. And having reached a spot

where it could turn around it did so. Presently the ground trembled as it made off through the steaming jungle. The leader of the mammals turned and faced the earth people. Long, searching minutes passed. Its close set eyes seemed to be studying them.

Nanette stirred and opened her eyes. The sight of the anthropoids caused her to recoil.

"Steady, Nan," spoke Carruthers softly.

Other apes and gorillas gathered around the giant red animal. They displayed no hostility, only an intense interest. One by one they squatted before the earth people until they formed a half circle, reaching from the one wall of the rocky plateau to the other.

While they sat there it began to grow dark.

Carruthers removed his watch and ventured a glance at it. Daylight had lasted less than three hours. An hour for twilight, then it would be dark. Evidently the cycle around the nucleus of the atom took approximately ten hours.

Nanette sat up. "Aaron!"

He answered without removing his eyes from the red ape less than four feet away. "Don't look at me, Nan. Concentrate on the big, red fellow. He's evidently in control. If we act the least bit frightened they might decide to destroy us."

"What are they waiting for? Why don't they go away?"

"We'll know before long. I imagine they're trying to figure out who we are and what we are doing on their tiny planet."

Darkness descended rapidly. Overhead, a small moon rose majestically in the heavens and started its journey through the night. Its faint light revealed the fact that the apes showed no intentions of leaving. They still squatted before the earth people, in a half circle of staring brown eyes.

Whatever fear Carruthers had felt towards the animals died away. "They're harmless," he told Nanette. "Get some sleep if you can."

Long after the tired girl had drifted into slumber Carruthers sat with his back against the wall, mentally trying to figure the whole thing out. The dinosaur was real enough. Yet the apemen had frightened it away, in fact had compelled it to go without actually engaging in combat. No question about it. The anthropoids were in control. But who controlled them?

Quite suddenly his eyes snapped open. Daylight had come again. He must have fallen asleep. The shrill chatter of the apeman came to his ears. The red ape leader shuffled to his feet and looked from the earth people to the spot in the jungle whence came the chatter. Abruptly he opened his mouth and emitted a flood of gibberish sounds.

The gorillas and apes at his side flattened their bodies against the rocky walls in attitudes of expectant waiting.

"What's happening?" gasped the girl.

"There's no telling," whispered Aaron. "It must be

someone or something of importance. Note the expressions of awe and reverence on the faces of the apemen. My God, Nanette, look!"

Out of the depths of the jungle emerged seven white beings—human or animal it was impossible to tell. They were huge creatures with the bodies of men. Erect of carriage, almost human in looks, they contrasted strangely with the red apes and the black gorillas. Six of them appeared to act as bodyguard for the seventh.

As they reached the space in front of the two earth people, the bodyguard stepped aside. The seventh white one came to a dead stop. Long and intently he stared at the man and girl crouched against the wall. And the scrutiny seemed to please him, for he smiled.

Carruthers eyed the figure uneasily. He saw what seemed to be a man dressed in a long, fibrous garment. With white hair and beard, it was a strange figure indeed for an apeman. He saw also that the eyes were well spaced, a mark of intelligence. The forehead was high and broad. And as Carruthers

mentally studied the creature, strange and bizarre thoughts crossed his mind.

The mouth of the white apeman twitched as if he were going to speak. The heavy lips parted. A single word came to Carruthers' ear—"Man?"

Carruthers nodded. "We are from the earth."

The lips of the apeman moved painfully as if speech came with the utmost of difficulty. "The prophecy of the Great One has been fulfilled even as it has been written."

The red apes and black gorillas allowed their eyes to wander from their white leader to the two earth people. And their faces reflected the supernatural awe with which they regarded the earth people.

"It's uncanny that an animal can speak our language," breathed Nanette.

As if he hadn't heard her, Carruthers spoke again.

"We are from the earth," he repeated. "We have been

on your world many hours, and we are both hungry and thirsty."

"Words come hard," came from the lips of the white bearded one. "I have not used them for years."

"And who are you?" asked Carruthers.

The white bearded one paused as if to recall some distant echo from the past. "I am the last of the tribe of Esau. But come! This is no place for speech. Long have I and my followers waited for this hour."

Without another word he swung around. The six guards enclosed his aged body in a hollow square and the procession moved away. They came after a short journey to a natural opening leading to the heart of the plateau. The apes and gorillas, with the exception of the red leader, remained outside. The remainder of the party pushed through a tortuous tunnel until they reached a cavernous opening directly beneath the plateau. Vertical openings in the walls furnished light and air. The white chieftain spoke in a strange tongue to his followers, and they instantly prepared three

couches in a far corner of the cavern.

As the earth people seated themselves on the skins that made up the couch they were both conscious of a far-away rumbling like peals of thunder. Not having seen any signs of a storm outside Carruthers turned inquiringly on the aged chieftain.

The old man's eyes were shadowed with grim foreboding. "I have ordered something to refresh you and your companion," he said. "Eat first, my friends. We will talk later."

The six body-guards left the main cavern. Presently they returned with large trays made of fanlike leaves resembling the palmetto. Fresh fruits and uncooked vegetables formed the bulk of the meal. In silence they ate. After the litter had been cleared away the guards withdrew with the exception of the giant red ape, who crouched near the opening to the tunnel.

"I am glad you have come," began the old chieftain, "but sorry, too. Our planet, or rather the higher forms of life upon it, are doomed."

Again there came to the ears of the earth people that far-off beat of sound that seemed to shake the ground. They looked to the white bearded leader for explanation.

"Ah, you hear it too," murmured the other. "For centuries, we of the great tribe of Esau have fought for the supremacy of our little world—ever since the Great One appeared in our midst and instructed us in world knowledge."

"And this Great One, as you call him," spoke Carruthers. "Who was he?"

"He was from your world. I never saw him. He comes to me as a legend. For years he toiled among us, teaching and instructing until we mastered his language. He called himself Dahlgren. Later he ruled all the tribes. We of the Esau line he made into leaders because of our higher intelligence. The tribes of Zaku were trained for war. Perhaps you have noticed the chief of all the Zakus. He is crouching now beside the entrance to our inner walls. He is Marbo, and his followers live in the jungles."

"And does he talk as you do?"

The white chieftain shook his head. "No. Only we of the Esau tribe have mastered speech. Not counting the women of our tribe that comprise our numbers we are only seven in all."

"I owe Marbo my life as does also my companion," said Carruthers.

"Marbo looks upon you earth people as gods," spoke the old chieftain. "He and his followers will protect you with their lives."

"And who rules over and beyond?" questioned Carruthers, waving his arm to cover the remaining portion of the electron.

"There is no rule beyond except that of force. The Great One called them by name, Morosaurus, Diplodocus, the Horned Ceratosaurus, and many others whose names I have long forgotten. They are our enemies whom we cannot destroy. And their numbers increase from year to year and are slowly

backing us upon our last stronghold."

"Isn't there anything we can do?" asked Carruthers, feeling a quiver of apprehension along his spine.

Slowly, the old chieftain shook his head. "Nothing whatever. Marbo and his followers can control one or two, but when the herds begin to push on into our territory, we are doomed. Even now their rumblings and bellowings come through the jungles. Their thirst and hunger for flesh is enormous."

Carruthers turned upon the girl. "The old chief's words explain everything, Nan. Professor Dahlgren has been here and gone. He lived a lifetime in the span of a few hours earth-time. Now it looks as if we were destined to follow in his footsteps."

"I'm not afraid," said the girl. "Nothing can be worse than what we have already passed through." And her eyes softened as she placed her small hands within those of Carruthers. "We have each other, Aaron."

He smiled reassuringly and turned to the old

chieftain. "I am Carruthers, a friend and assistant to Dahlgren. The girl here is Nanette."

The chieftain smiled gravely. "And I am Zark. Welcome to my kingdom, Carruthers and Nanette. We need you here. Now tell me of your world, for long have I waited for a follower of the great Dahlgren to appear before my people."

Throughout the remainder of the day Carruthers talked. The shafts of light paled at the end of the short day. Night came, bringing with it a sense of security against the increasing hordes that thundered and trumpeted beyond the borders of the jungle.

In the morning Zark instructed Marbo to remain close to Carruthers at all times. So the young scientist left the cavern and ascended the path leading to the top of the plateau. He looked at his watch and compared the second hand with the nucleus atom sailing across the heavens to estimate its speed.

Days passed as he made his observations. Meanwhile he had searched and found the exact spot wherein he

and Nanette had first stepped foot onto the electron. This spot he carefully marked off with a ring of huge boulders carried up by the followers of Marbo. Then he began to calculate upon his pad. There must be no mistakes. He and Nanette must be within the magic circle at the estimated time.

Between times he helped Nanette construct their living quarters in the cavern. Zark had furnished them with skins and furs with which to cover the walls. Carruthers made a fireplace of stones and restored the lost art of fire to Zark, Marbo and their followers.

Days slipped by like minutes. Short days filled with excursions into the jungles. Carruthers' face soon bristled with a stubble of beard. This lengthened with time. Sharp thorns tore their clothes to ribbons. Nanette, womanlike, cried many times during the nights because of the lack of a mirror and a comb for her untidy hair.

But other and more important events soon claimed the attention of the earth people. Day by day the

herds of dinosaurs and other monsters of like breed edged closer and closer to the tiny civilization around the plateau. It worried Carruthers so much that he sought out Zark and had him bring the other six members of his tribe together for a council of war.

"A complete defensive system, Zark," he told them. "We must make a fortress of the plateau and fill the caverns with food."

Zark shook his head. "No. It is quite useless. Followers of Marbo have recently returned from over the beyond and report strange things. I have hesitated to speak of them for fear of alarming you. Our planet is breaking up. Violent eruptions have caused fires of stone and mud. The rumblings you have heard were not made entirely by our enemies. They came from the ground.

"An earthquake," murmured Carruthers, momentarily stunned by the news. "But they are always of short duration, Zark. We have them on our own planet."

"Ah, but these are different. They cover the whole of

our globe. The great Dahlgren noted them while he was with us. He wrote many words and figures on paper concerning them. Only yesterday I unearthed these records. The life of our planet was doomed to destruction during the present year. What matter if the herds of dinosaurs overrun us and destroy lives? In the end they, too, will be destroyed. It is fate. We can do nothing."

Even as the old chieftain spoke a gigantic rumbling, greater in intensity than any heretofore, shook the electron. Above the deep rolling disturbance underground rose the shrill cries of the apemen.

Carruthers leaped to his feet and raced through the tunnel. A herd of dinosaurs choked the path leading to the outside entrance. Marbo brushed past him, shrilling in great excitement.

"Drive them away!" ordered Carruthers. "Like this!" He hurled a rock at the eye of the nearest animal.

The dinosaur bellowed and backed away. The apes, and gorillas, used to fighting only with their long

arms, caught on to the stunt with surprising quickness. Their powerful arms reached out. Stones and boulders began to hurtle from the mouth of the tunnel. They thudded against the heads of the great monsters like hailstones.

Subdued and frightened by this sudden display of force, the monsters withdrew down the path. But the apemen had discovered a new method of warfare. They found a childish delight in hurling stones. Within a few minutes the slope was barren of rocks. The animals followed up their momentary advantage and ran screaming down the path. The dinosaurs fled in panic.

As soon as the enemy had been driven away, Carruthers pointed out to Marbo the advantage of gathering the stones up from the ground and returning them to the space around the mouth of the tunnel so that he and his followers would be ready for a second repulse.

Zark appeared at this moment and helped with the explanation. His crafty old eyes turned with new

respect upon the earthman.

Carruthers toiled with them every day from then on, building and fortifying the plateau against further incursions of the monsters. Security and peace reigned for several weeks then hostilities broke out afresh.

The rumblings of the electron had increased with each passing week. Volcanic eruptions poured fresh discharges of molten lava and fiery sparks along the edges of the jungles.

"I don't want to needlessly alarm you, Nan," he told her that night, "but the fires have started. Zark was right. Unless we have rain before to-morrow morning the heat and smoke will drive us out into the open."

"But we can go to the top of the plateau," suggested the girl. "There aren't any trees—"

A concentrated bellowing cut off the rest of her words. Driven towards higher ground by the heat of the flames, the dinosaurs were trampling up the path

leading to the tunnel.

Once again Carruthers rallied his army of apemen around him and attempted to drive the mammals away. As they reached the end of the tunnel a cloud of dense smoke stung their eyes. The apemen shrilled in a sudden panic and forgot all their previous training in driving off the dinosaurs. Like scurrying rats they scattered.

Flames from the conflagration broke through the smoke—flames that leaped and twisted skyward.

Carruthers flung off the fear that held him spellbound and started along up the path leading to the top of the plateau. A disheveled figure appeared suddenly at his side—Nanette!

"Come," he whispered, hoarsely. "We've got to get out of this or we'll choke to death."

"But Zark," breathed the girl, "He and his followers are still in the cavern. We can't leave them."

Like one demented of reason, Carruthers raced back along the tunnel to the cavern. "Zark!" he shouted.

The sound of his voice was drowned in the welter of screaming bedlam coming up from below as the dinosaurs and apes fought for the supremacy of life. But of Zark and his six followers he found absolutely no sign. Quickly he hurried back to where he had left Nanette.

Even as he reached the spot he had a sudden premonition of danger. A gorilla, huge and black, brushed past him on the path, carrying a limp burden under his shaggy arm.

"Stop!" commanded Carruthers, hurrying after the animal.

A huge arm knocked him sprawling. Spitting blood Carruthers staggered to his feet. Up to this time he had felt no fear of the gorillas. They had been orderly and well behaved. Fearful that harm would come to the girl he ran after the dark figure ahead. The red glow of flames swept nearer. The gorilla came to a

stop and faced its pursuer. Lust shone from its close-set eyes—lust and passion.

Carruthers stopped dead in his tracks. "Drop her!" he demanded.

The animal snarled hoarsely. There came the sound of ripping cloth. Nanette screamed—a terrifying scream that echoed and re-echoed through the electron night.

It was then that the thin cloak of civilization dropped from Aaron Carruthers' back. He became in a single moment an animal fighting for his mate. With a snarl equally vicious as that of the gorilla pawing at the helpless girl, he lunged forward.

Mouthing his rage, the gorilla flung the earth man to the ground. Carruthers came up frothing at the mouth. With grim intensity he fastened himself to the animal's free arm. The raging mammal staggered helplessly under the extra burden and dropped the girl to concentrate his fury on the man. It raised a hairy arm aloft for the smashing blow. Instinctively Carruthers released his hold.

At that very moment the electron lurched sickeningly, causing them both to lose their footing. The violent upheaval sent Carruthers one way and the gorilla the other. While the man stumbled to his feet to resume battle he saw the infuriated monster stagger over the edge of the plateau wall into a sheer drop of a thousand feet.

Starkly through the night came the growling roars of the giant beasts from the jungles below. Nanette fluttered to his side. Her dress was torn and dragged on the ground. For all her disheveled appearance she was still beautiful to look upon. Forgetful of the danger on all sides of him, the animal in Carruthers saw in her pitifully half-clad body the same thing that the beast had desired. His head whirled hotly.

"Aaron!" she pleaded as his arm reached out to clutch her.

Hungrily he drew her to him. The pale light of the electron moon mingled with the roaring blast of the flames. Madness inflamed his heart and pounded his blood.

"Don't, Aaron," protested the girl, trying to free herself.

Something in the quality of the girl's frightened tones brought the man back to normal. He fought against the overwhelming desire to possess with all the force of his nature. And the better half triumphed. No longer was he an animal, but a reasoning human being. With a faint sigh he released her and wiped a hand across his dripping forehead.

"I'm sorry, Nan," he murmured. "That great brute drove me mad for an instant. I'm all right now."

Together they stood in the electron night and watched death creep closer and closer. The plateau was entirely surrounded with flames now and the heat was increasing with each passing moment. As it increased they backed towards the center.

From under their feet came the choking cries of the apemen. They had returned to the cavern only to be overcome by smoke fumes. While yet the earth people stood there waiting and watching the red death creep

nearer, the path leading downward into the jungle became a mass of moving shadows.

"The dinosaurs!" cried Nanette. "Oh, Aaron! We are lost!"

"Steady, girl," soothed the man. "If we stand still they might not see us in the dark. The smoke will destroy our scent."

But as the minutes passed the herd of monsters increased. They crowded along the path and spread out over the top of the plateau. Once again the smell of their glistening bodies fouled the nostrils of the earth people.

Slowly Carruthers guided Nanette back towards the ring of rocks—perhaps the barrier would serve to keep the animals away. He scrambled across one of the boulders and pulled the girl after him. As he did so, a violent subterranean action shook the electron from one end to the other.

Carruthers braced his feet against the ring of rocks to

keep from pitching headlong to the ground. Nanette clung to him wordlessly. All around them the giant forces of nature raged sullenly. Twisting seams appeared in the rocky floor of the plateau from which oozed gaseous vapors.

"Courage," soothed Carruthers as he held the quivering body of the frightened girl close to his own. "This can't last."

But the ground continued to lurch and heave on its axis. Vivid lights crossed and criss-crossed the atomic heavens. The fissures in the ground appeared now as black canals. The lower part of the circle of boulders disappeared. Off to the right came despairing screams. White bodies glowed for an instant against the background of flames.

"Zark!" shouted Carruthers, as he saw the leader of the tribe of Esau and his followers making their way along the plateau top.

Zark must have heard the earth-man's voice, for he started forward at a run. Simultaneously there

appeared a herd of the greatest of all the prehistoric monsters—the Brontosaurus. They balked enormously against the flame-licked skies. Zark and his followers attempted to avoid them. But fear of the scorching flames drove the monsters forward. There followed a maddening moment of unutterable pain for the remaining ones of the tribe of Esau, then the herd trampled them underfoot and rumbled towards the half circle of rocks where the two earth people were crouched.

The leader of the Brontosaurus herd trumpeted madly and barged for the higher ground of safety. Too late did instinct warn it of the widening fissure underfoot. Before it could stop the pressure of the herd drove it into the crevice.

Carruthers drew back to the extreme inside edge of the boulders trying to still his ears against their insane bellowings. A cloud of heavy, choking smoke enveloped him for a moment then passed away. Then it was that he saw a new star in the atomic heavens,—a star that seemed to burn with the brilliance of a meteor. Even as he watched he was conscious of it

drawing closer.

The planet was now in a continuous uproar. The ground was heaving and trembling as if from some inward strain. This was the end. Carruthers realized it with a sinking heart. In another minute the electron would disintegrate into a flaming mass of matter and fling itself from its orbit around the atom.

And then the light from the approaching star struck them in a blinding radiance of vermillion flames. Carruthers held his breath. Some invisible force seemed to take possession of his body and that of the girl at his side. The rocky plateau, now a boiling mass of rocks, dropped from under their feet. Clear, cold air enveloped their bodies. Then with the speed of light their bodies were hurled through planetary space, up, up, up into the vast reaches of the higher ether.

Darkness assailed them. The flames from the jungle fire vanished into nothingness. The electron moon paled to the size of a pin point, then went out.

Carruthers had the feeling of expansion and growth. It was as if his body was taking on the size of the whole world. It seemed to last for hours, days, ages. But all the while he clung fast to the slender, quivering body of Nanette.

Mountains and hills suddenly blazed before his eyes. Straight up and down mountains. He tried to stir his sluggish mind into action. What did they mean? Where had he seen them before? And while yet his mind struggled with the problem the mountains dwindled like melting snow. The pressure around his body relaxed. A blinding glare of steady light played upon his face. Then all was quietness and peace.

"Nan! Aaron!" The voice was Karl's.

Dazedly they looked around. What had once been mountains were now desks and chairs. They were back again in the laboratory. Several agonizing minutes passed before either could grasp the startling change in things. The horror of the electronic disaster still filled their minds to overflowing.

Carruthers recovered first. He stepped from the railed inclosure marking the spot where the atomic beam had restored them after their space flight, and guided the girl to a chair. Karl's face was drawn and white as his eyes rested on the two pitiful figures that had materialized out of the ether.

"Don't ask us any questions yet," spoke Carruthers in a tired voice. "We've passed through too many horrors. What was the matter, Karl? Couldn't you get the rays to work sooner?"

"Sooner?" Danzig's eyes were wide with wonder. He glanced at his watch. "It was a little difficult to control both machines all alone, but I switched off the ray from the inverse dimensional tubes and turned on the other immediately. All in all it must have taken me fifteen seconds."

"Fifteen seconds," repeated Carruthers, dazedly. "It's unbelievable." He dropped wearily into a chair and rested his forehead in the palms of his hands. "How long have we been gone, Nan?"

Nanette pulled the ragged remnants of a dress around her knees and attempted a smile. "Almost four months, according to the passage of time on the electron."

"Impossible!" whispered Danzig, shutting his eyes to the truth.

Aaron Carruthers pointed to his clothes, now ragged and torn. "Look, Karl! Everything I have on is worn out completely. Observe my hair and beard, and the soles of my shoes. Human reason to the contrary, Nanette and I have lived like two animals for four months, and all in the space of fifteen seconds earth time. How can you account for it? We figured it out on paper. And we've proved it with our bodies. What it will mean to future civilization I can't foretell. It's beyond imagination."

And the laboratory became silent as a tomb as the three people tried with all the strength of their minds to grasp the miracle of the strange and unfathomable atomic rays.

#54 An Extra Man, By Jackson Gee:

Sealed and vigilantly guarded was "Drayle's invention, 1932"—for it was a scientific achievement beyond which man dared not go.

Aproximate word count:

Bigotry:

Warnings:

Harry turns into a thick smoke, and gets sucked into a

big hole in the machine."

- - -

Sealed and vigilantly guarded was "Drayle's Invention, 1932"—for it was a scientific achievement beyond which man dared not go.

- - -

Rays of the August mid-day sun pouring through the museum's glass roof beat upon the eight soldiers surrounding the central exhibit, which for thirty years has been under constant guard. Even the present sweltering heat failed to lessen the men's careful observation of the visitors who, from time to time, strolled listlessly about the room.

The object of all this solicitude scarcely seemed to require it. A great up-ended rectangle of polished steel some six feet square by ten or a dozen feet in height, standing in the center of Machinery Hall, it suggested nothing sinister or priceless. Two peculiarities, however, marked it as unusual—the concealment of its mechanism and the brevity of its

title. For while the remainder of the exhibits located around it varied in the simplicity or complexity of their design, they were alike in the openness of their construction and detailed explanation of plan and purpose. The great steel box, however, bore merely two words and a date: "Drayle's Invention, 1932."

It was, nevertheless, toward this exhibit that a pleasant appearing white-haired old gentleman and a small boy were slowly walking when a change of guard occurred. The new men took their posts without words while the relieved detail turned down a long corridor that for a moment echoed with the clatter of hobnailed boots on stone. Then all was surprisingly still. Even the boy was impressed into reluctant silence as he viewed the uniformed men, though not for long.

"What's that, what's that, what's that?" he demanded presently with shrill imperiousness. "Grandfather, what's that?" An excited arm indicated the exhibit with its soldier guard.

"If you can keep still long enough," replied the old

gentleman patiently, "I'll tell you."

And with due regard for rheumatic limbs he slowly settled himself on a bench and folded his hands over the top of an ebony cane preparatory to answering the youngster's question. His inquisitor, however, was, at the moment, being hauled from beneath a brass railing by the sergeant of the watch.

"You'll have to keep an eye on him, sir," said the man reproachfully. "He was going to try his knife on the wood-work when I caught him."

"Thank you, Sergeant. I'll do my best—but the younger generation, you know."

"Sit still, if possible!" he directed the squirming boy. "If not, we'll start home now."

The non-com took a new post within easy reaching distance of the disturber and attempted to glare impressively.

"Go on, grandfather, tell me. What's D-r-a-y-l-e?

What's in the box? Can't they open it? What are the soldiers for? Must they stay here? Why?"

"Drayle," said the old man, breaking through the barrage of questions, "was a close friend of mine a good many years ago."

"How many, grandfather? Fifty? As much as fifty? Did father know him? Is father fifty?"

"Forty; no; yes; no," said the harassed relative; and then with amazing ignorance inquired: "Do you really care to hear or do you just ask questions to exercise your tongue?"

"I want to hear the story, grandpa. Tell me the story. Is it a nice story? Has it got bears in it? Polar bears? I saw a polar bear yesterday. He was white. Are polar bears always white? Tell me the story, grandpa."

The old man turned appealing eyes toward the sergeant. Tacitly a sympathetic understanding was established. The warrior also was a father, and off the field of battle he had known defeat.

"Leave me handle him, sir," he suggested. "I've the like of him at home."

"I'd be very much indebted to you if you would."

Thus encouraged, the soldier produced from an inner pocket and offered one of those childhood sweets known as an "all day sucker."

"See if you can choke yourself on that," he challenged.

The clamor ceased immediately.

"It always works, sir," explained the man of resource. "The missus says as how it'll ruin their indigestions, but I'm all for peace even if I am in the army."

Now that his vocal organs were temporarily plugged, the child waved a demanding arm in the direction of the main exhibit to indicate a desire for the resumption of the narrative. But the ancient was not anxious to disturb so soon the benign and acceptable silence. In fact it was not until he observed the

sergeant's look of inquiry that he began once more.

"That box," he said slowly, "is both a monument and a milestone on the road to mankind's progress in mechanical invention. It marks the point beyond which Drayle's contemporaries believed it was unsafe to go: for they felt that inventions such as his would add to the complexities of life, and that if a halt were not made our own machines would ultimately destroy us.

"I did not, still do not, believe it. And I know Drayle's spirit broke when the authorities sealed his last work in that box and released him upon parole to abandon his experiments."

As the speaker sighed in regretful reminiscence, the sergeant glanced at his men. Apparently all was well: the only visible menace lolled within easy arm's reach, swinging his short legs and sucking noisily on his candy. Nevertheless the non-com shifted to a slightly better tactical position as he awaited the continuance of the tale.

"Christopher Drayle," said the elderly gentleman, "was the greatest man I have ever known, as well as the finest. Forty years or more ago we were close friends. Our homes on Long Island adjoined and I handled most of his legal affairs. He was about forty-five or six then, but already famous.

"His rediscovery of the ancient process of tempering copper had made him one of the wealthiest men in the land and enabled him to devote his time to scientific research. Electricity and chemistry were his specialties, and at the period of which I speak he was deeply engrossed in problems of radio transmission.

"But he had many interests and not infrequently visited our local country club for an afternoon of golf. Sometimes I played around the course with him and afterward, over a drink, we would talk. His favorite topic was the contribution of science to human welfare. And even though I could not always follow him when he grew enthusiastic about some new theory I was always puzzled.

"It was at such a time, when we had been discussing

the new and first successful attempt to send moving pictures by radio, that I mentioned the prophecy of Jackson Gee. Gee was the writer of fantastic, pseudo-scientific tales who had said: 'We shall soon be able to resolve human beings into their constituent elements, transmit them by radio to any desired point and reassemble them at the other end. We shall do this by means of vibrations. We are just beginning to learn that vibrations are the key to the fundamental process of all life.'

"I laughed as I quoted this to Drayle, for it seemed to me the ravings of a lunatic. But Drayle did not smile. 'Jackson Gee,' he said, 'is nearer to the truth than he imagines. We already know the elements that make the human body, and we can put them together in their proper proportions and arrangements: but we have not been able to introduce the vitalizing spark, the key vibrations to start it going. We can reproduce the human machine, but we can not make it move. We can destroy life in the laboratory, and we can prolong it, but so far we have not been able to create it. Yet I tell you in all seriousness that that time will come;

that time will come.'

"I was surprised at his earnestness and would have questioned him further. But a boy appeared just then with a message that Drayle was wanted at the telephone.

"Something important, sir," he said. Drayle went off to answer the summons and later he sent word that he had been called away and would not be able to return.

"It was the last I heard from Drayle for months. He shut himself in his laboratory and saw no one but his assistants, Ward of Boston, and Buchannon of Washington. He even slept in the workshop and had his food sent in.

"Ordinarily I would not have been excluded, for I had his confidence to an unusual degree and I had often watched him work. I admired the deft movements of his hands. He had the certain touch and style of a master. But during that period he admitted only his aids.

“Consequently I felt little hope of reaching him one morning when it was necessary to have his signature to some legal documents. Yet the urgency of the case led me to go to his home on the chance that I might be able to get him long enough for the business that concerned us. Luck was with me, for he sent out word that he would see me in a few minutes. I remember seating myself in the office that opened off his laboratory and wondering what was beyond the door that separated us. I had witnessed some incredible performances in the adjoining room.

"At last Drayle came in. He looked worried and careworn. There were new lines in his face and blue half-circles of fatigue beneath his eyes. It was evident that it was long since he had slept. He apologized for having kept me waiting and then, without examining the papers I offered, he signed his name nervously in the proper spaces. When I gathered the sheets together he turned abruptly toward the laboratory, but at the door he paused and smiled.

"'Give my respects to Jackson Gee,' he said."

"Who's Jackson Gee? Does father know him? Has he any polar bears? Aren't you going to tell me about that?"

The tidal wave of questions almost overwhelmed the historian and his auditor. But the military, fortunately, was equal to the emergency. With a tactical turn of his hand he thrust the remnant of the lollypop between the chattering jaws and spoke with sharp rapidity.

"Listen," he commanded, "that there, what you got, is a magic candy, and if you go on exposing it to the air after it is once in your mouth it's likely to disappear, just like that." And the speed of the translation was illustrated by a smart snapping of the fingers.

Doubt shone in the juvenile terror's eyes and the earlier generations waited fearfully while skepticism and greed waged their recurrent conflict. For a time it seemed as if the veteran had blundered; but finally greed triumphed and a temporary peace ensued.

"Where was I?" inquired the interrupted narrator

when the issue of battle was settled.

"You was talking about Jackson Gee," answered the guardsman in a cautiously low tone.

"So I was, so I was," the old gentleman agreed somewhat vaguely, nodding his head. He gazed at the sergeant with mingled awe and admiration. "I suppose it's quite useless to mention it," he said rather wistfully, "but if you ever get out of the army and should want a job.... You could name your own salary, you know?" The question ended on an appealing note.

Evidently the soldier understood the digression, for he replied in a tone that would brook no dispute. "No, sir, I couldn't consider it."

"I was afraid so," said the other regretfully, and added, with apparent irrelevance, "I have to live with him, you see."

"Tough luck," commiserated the listener.

Reluctantly summoning his thoughts from the pleasant contemplation of what had seemed to offer a new era of peace, the bard turned to his story.

A few hours later," he continued, "I had a telephone call from Drayle's wife, and I realized from the fright in her voice that something dreadful had happened. She asked me to come to the house at once. Chris had been hurt. But she disconnected before I could ask for details. I started immediately and I wondered as I drove what disaster had overtaken him. Anything, it seemed to me, might have befallen in that room of miracles. But I was not prepared to find that Drayle had been shot and wounded.

"The police were before me and already questioning the assailant, Mrs. Farrel, a fiery tempered young Irish-woman. When I entered the room she was repeating half-hysterically her explanation that Drayle had killed her husband in the laboratory that morning.

"'Right before my eyes, I seen it,' she shouted. 'Harry was standing on a sort of platform looking at a big

machine like, and so help me he didn't have a stitch of clothes on, and I started to say something, but all at once there came a terrible sort of screech and a flash like lightnin' kinda, in front of him. Then Harry turns into a sort of thick smoke and I can see right through him like he was a ghost; and then the smoke gets sucked into a big hole in the machine and I know Harry's dead. And here's this man what done it, just a standin' there, grinnin' horrid. So something comes over me all at once and I points Harry's gun at him and pulls the trigger!'

"Even before the woman had finished I recalled what I seen one afternoon in Drayle's laboratory many months before. I had been there for some time watching him when he placed a small tumbler on a work table and asked me if I had ever seen glass shattered by the vibrations of a violin. I told him that I had, but he went through the demonstration as if to satisfy himself. Of course when he drew a bow across the instrument's strings and produced the proper pitch the goblet cracked into pieces exactly as might have been expected. And I wondered why Drayle

concerned himself with so childish an experiment before I noticed that he appeared to have forgotten me completely.

"I endeavored then not to disturb him, and I remember trying to draw myself out of his way and feeling that something momentous was about to take place. Yet actually I believe it would have required a considerable commotion to have distracted his attention, for his ability to concentrate was one of the characteristics of his genius.

"I saw him place another glass on the table and I noticed then that it stood directly in front of a complicated mechanism. At first this gave out a low humming sound, but it soon rose to an unearthly whining shriek. I shrank from it involuntarily and a second later I was amazed at the sight of the glass, seemingly reduced to a thin vapor, being drawn into a funnel-like opening near the top of the device. I was too startled to speak and could only watch as Drayle started the contrivance again. Once more its noise cut through me with physical pain. I cried out. But my voice was overwhelmed by the terrific din of the

mysterious machine.

"Then Drayle strode down the long room to another intricate mass of wire coils and plates and lamps. And I saw a dim glow appear in two of the bulbs and heard a noise like the crackling of paper. Drayle made some adjustments, and presently I observed a peculiar shimmering of the air above a horizontal metal grid. It reminded me of heat waves rising from a summer street, until I saw the vibrations were taking a definite pattern; and that the pattern was that of the glass I had seen dissolved into air. At first the image made me think of a picture formed by a series of horizontal lines close together but broken at various points in such fashion as to create the appearance of a line by the very continuity of the fractures. But as I watched, the plasma became substance. The air ceased to quiver and I was appalled to see Drayle pick up the tumbler and carry it to a scale on which he weighed it with infinite exactness. If he had approached me with it at that moment I would have fled in terror.

"Next, Drayle filled the goblet with some liquid which

immediately afterward he measured in a beaker. The result seemed to please him, for he smiled happily. At the same instant he became aware of my presence. He looked surprised and then a trifle disconcerted. I could see that he was embarrassed by the knowledge that I had witnessed so much, and after a second or two he asked my silence. I agreed at once, not only because he requested it but because I couldn't believe the evidence myself. He let me out then and locked the door.

"It was this recollection that made me credit the woman's story. But I was sick with dread, for in spite of my faith in Drayle's genius I feared he had gone mad.

"Mrs. Drayle had listened to Mrs. Farrel's account calmly enough, but I could see the fear in her eyes when she signaled a wish to speak to me alone. I followed her into an adjoining room, leaving Mrs. Farrel with the two policemen and the doctor, who was trying to quiet her.

"As soon as the door closed after us Mrs. Drayle

seized my hands.

"Tim,' she whispered, 'I'm horribly afraid that what the woman says is true. Chris has told me of some wonderful things he was planning to do, but I never expected he would experiment on human beings. Can they send him to prison?'

"Of course I said what I could to comfort her and tried to make my voice sound convincing. At the time the legal aspect of the matter did not worry me so much as the fear that the attack on Drayle might prove fatal. For even if it should develop that he was not dangerously hurt, I imagined that the interruption of the experiment at a critical moment might easily have ruined whatever slim chance there had been of success. For us the nerve-wracking part was that we could do nothing until the surgeon who was attending Drayle could tell us how badly he was injured.

"At last word came that the bullet had only grazed Drayle's head and stunned him, but that he might remain unconscious for some time. Mrs. Drayle went in and sat at her husband's side, while I returned to

the laboratory and found the police greatly bewildered as to whether they ought to arrest Drayle.

"They had discovered in a closet an outfit of men's clothing that Mrs. Farrel identified as her husband's, and, although they saw no other trace of the missing man, they had a desire to lock up somebody as an evidence of their activity. It took considerable persuasion to prevail upon them to withhold their hands. There was no such difficulty about restraining them in the laboratory. They were afraid to touch any apparatus, and they gave the invention a ludicrously wide berth.

"I never knew exactly how long it was that I paced about the lower floor of Drayle's home before the doctor summoned me and announced that the patient wanted me, but that I must be careful not to excite him. I have often wondered how many physicians would have to abandon their profession if they were deprived of that phrase. 'You must not excite the patient.'

"Drayle was already excited when I entered. In fact,

he was furious at the doctor's efforts to restrain him. But I realized that my fear for his reason was groundless. His remarks were lucid and forceful as he raged at the interference with his work. As soon as he saw me he appealed for assistance.

"'Make them let me alone. Tim,' he begged, as his wife and the doctor, partly by force and partly by persuasion, endeavored to hold him in bed. 'I must get back to the laboratory. That woman believes that I've killed her husband, and my assistant will think that we've failed.'

"I was about to argue with him when suddenly he managed to thrust the doctor aside and start toward the door. His seriousness impressed me so that I gave him a supporting arm and together we headed down the hall, with Mrs. Drayle and the doctor following anxiously in the rear. The laboratory was deserted and locked when we arrived. The police evidently felt it was too uncanny an atmosphere for a prolonged wait. Drayle opened the door, went directly to his machine, and examined it minutely.

"Thank the Lord that woman hit only me!" he said, and sank into a chair. Then he asked for some brandy. Mrs. Drayle rushed off and reappeared in a minute with a decanter and glass. Drayle helped himself to a swallow that brought color to his cheeks and new strength to his limbs. Immediately after he turned again to the machine. I dragged up a chair, assisted him into it, and seated myself close by.

"I knew little enough about mechanics, but I was fascinated by the numerous gauges that faced me on the gleaming instrument board. There were dials with needlelike hands that registered various numbers; spots of color appeared in narrow slots close to a solar spectrum: a stream of graph-paper tape flowed slowly beneath a tracing-pen point and carried away a jiggly thin line of purple ink. In a moment Drayle was oblivious of everything but his records. I watched him copy the indicated figures, surround them with formulas, and solve mysterious problems with a slide-rule.

"His calculations covered a large sheet before he had finished. At last he underscored three intricate

combinations of letters and figures and carried the answers to his private radio apparatus. This operated on a wave length far outside the range of all others and insured him against interference. With it he was able to speak at any time with his assistants in Washington or Boston or with both at once. He threw the switch that sent his call into the air. An answer came instantly, and Drayle began to talk to his distant lieutenants.

"We've been interrupted, gentlemen," he said, "but I think we may continue now. We'll reassemble in the Boston laboratory. Have you arranged the elements? The coefficients are...." And he gave a succession of decimals.

"A voice replied that all was ready. Drayle said 'Excellent,' went back to his invention and twisted a black knob on the board before him.

"With this trifling movement all hell seemed to crash about us. The ghastly cacophony that I had experienced in the same room some months previously was as nothing. These stupendous waves of

sound pounded us until it seemed as if we must disintegrate beneath them. Wails and screams engulfed us. Mrs. Drayle dropped to her knees beside her husband. The doctor seized my arm and I saw the knuckles of his hand turn white with the pressure of his grip, yet I felt nothing but the awful vibrations that drummed like riveting machines upon and through my nerves and body. It was not an attack upon the ears alone; it crashed upon the heart, beat upon the chest so that breathing seemed impossible. My brain throbbed under the terrific pulsations. For a while I imagined the human system could not endure the ordeal and that all of us must be annihilated.

"Except for his slow turning of the dials Drayle was motionless before the machine. Below the bandage about his forehead I could see his features drawn with anxiety. He had wagered a human life to test his theory and I think the enormity of it had not struck him until that moment.

"What I knew and hoped enabled me to imagine what was taking place in the Boston laboratory. I seemed to see man's elementary dust and vapors whirled from

great containers upward into a stratum of shimmering air and gradually assume the outlines of a human form that became first opaque, then solid, and then a sentient being. At the same instant I was conscious that the appalling pandemonium had ceased and that the voice of Drayle's Boston assistant was on the radio.

"Congratulations, Chief! His reassemblage is perfect. There's not a flaw anywhere." "Splendid," Drayle answered. "Bring him here by plane right away; his wife is worried about him."

"Then Drayle turned to me.

"You see," he said, "Jackson Gee was right. We have resolved man into his constituent elements, transmitted his key vibrations by radio, and reassembled him from a supply of identical elements at the other end. And now, if you will assure that woman that her husband is safe, I will get some sleep. You will have the proof before you in less than three hours."

"I can't vouch for the doctor's feelings, but as Drayle left us I was satisfied that everything was as it should be, and that I had just witnessed the greatest scientific achievement of all time. I did not foresee, nor did Drayle, the results of an error or deliberate disobedience on the part of one of his assistants.

"We waited, the doctor and I, for the arrival of the man who, we were convinced, had been transported some three hundred miles in a manner that defied belief. The evidence would come, Drayle had said, in a few hours. Long before they had elapsed we were starting at the sound of every passing motor, for we knew that a plane must land some distance from the house and that the travelers would make the last mile or so by car.

"Mrs. Drayle endeavored to convince the imagined widow that her husband was safe and was returning speedily. Later she rejoined us, full of questions that we answered in a comforting blind faith. The time limit was drawing to a close when the sound of an automobile horn was quickly followed by a sharp knock on the laboratory door. At a sign from Mrs.

Drayle one of the policemen opened it and we saw two men before us. One, a scholarly appearing, bespectacled youth, I recognized as Drayle's Boston assistant, Ward; the other, a rather burly individual, was a stranger to me. But there was no doubt he was the man we awaited so eagerly, for Mrs. Farrel screamed 'Harry! Harry!' and sped across the room towards him.

“At first she ran her fingers rather timidly over his face, and then pinched his huge shoulders, as if to assure herself of his reality. The sense of touch must have satisfied her, for abruptly she kissed him, flung her arms about him, clung to him, and crooned little endearments. The big man, in turn, patted her cheeks awkwardly and mumbled in a convincingly natural voice, "Sall right, Mary, old kid! There ain't nothin' to it. Yeah! Sure it's me!"

"Then I was conscious of Drayle's presence. A brown silk dressing gown fell shapelessly about his spare frame and smoke from his cigarette rose in a quivering blue-white stream. Ward spied him at the same moment and stepped forward with quick

outstretched hands. I remember the flame of adoring zeal in the youngster's eyes as he tried to speak. At length he managed to stammer some congratulatory phrases while Drayle clapped him affectionately on the back.

"Then Drayle turned to Farrel to ask him how he enjoyed the trip. Farrel grinned and said, 'Fine! It was like a dream, sir! First I'm in one place and then I'm in another and I don't know nothing about how I got there. But I could do with a drink, sir. I ain't used to them airypalanes much.'

"Drayle accepted the hint and suggested that we all celebrate. He gave instructions over a desk telephone and almost immediately a man entered with a small service wagon containing a wide assortment of liquors and glasses. When we had all been served, Ward asked somewhat hesitantly if he might propose a toast. 'To Dr. Drayle, the greatest scientist of all time!'

"We were of course, already somewhat drunk with excitement as we lifted our glasses. But Drayle would

not have it.

"Let me amend that,' he said. 'Let us drink to the future of science.'

"Sure!' said Farrel, very promptly. I think he was somewhat uncertain about 'toast,' but he clung hopefully to the word 'drink.'

"We had raised our glasses again when Drayle, who was facing the door, dropped his. It struck the floor with a little crash and the liquor spattered my ankles. Drayle whispered 'Great God!' I saw in the doorway another Farrel. He was grimy, disheveled, his clothing was torn, and his expression ugly; but his identity with 'Harry' was unescapable. For an instant I suspected Drayle of trickery, of perpetrating some fiendishly elaborate hoax. And then I heard Mrs. Farrel scream, heard the newcomer cry, 'Mary,' and saw two men staring at each other in bewilderment.

"The explanation burst upon me with a horrible suddenness. Farrel had been reconstructed in each of Drayle's distant laboratories, and there stood before

us two identities each equally authentic, each the legal husband of the woman who, a few hours previously, had imagined herself a widow. The situation was fantastic, nightmarish, unbelievable and undeniable. My head reeled with the fearful possibilities.

"Drayle was the first to recover his poise. He opened a door leading into an adjoining room and motioned for us all to enter. That is, all but the police. He left them wisely with their liquor. 'Finish it,' he advised them. 'You see no one has been killed.'

"They were not quite satisfied, but neither were they certain what they ought to do, and for once displayed common sense by doing nothing. When the door closed after us I saw that Buchannon, the Washington laboratory assistant, was with us. He must have arrived with the second Farrel, although I had not observed him during the confusion attending the former's unexpected appearance. But Drayle had noted him and now seized his shoulders. 'Explain!' he demanded.

"Buchannon's face went white and he shrank under the clutch of Drayle's fingers. Beyond them I saw the two twinlike men standing beside Mrs. Farrel, surveying each other with incredulous recognition and distaste.

"'Explain!' roared Drayle, and tightened his grasp.

"'I thought you said Washington, Chief.' His voice was not convincing. I didn't believe him, nor did Drayle.

"'You lie!' he raged, and floored the man with his fist.

"In a way I couldn't help feeling sorry for the chap. It must have been a frightful temptation to participate in the experiment and I suppose he had not foreseen the consequences. But I began to have a glimmering of the magnificent possibilities of the invention for purposes far beyond Drayle's intent. For, I asked myself, why, if such a machine could produce two human identities, why not a score, a hundred, a thousand? The best of the race could be multiplied indefinitely and man could make man at last, literally out of the dust of the earth. The virtue of

instantaneous transmission which had been Drayle's aim sank into insignificance beside it. I fancied a race of supermen thus created. And I still believe, Sergeant, that the chance for the world's greatest happiness is sealed within that box you guard. But its first fruits were tragic."

The historian shifted his position on the bench so as to escape the sun that was now reflected dazzlingly by the polished steel casket.

"Drayle did not glance again at his disobedient lieutenant. He was concerned with the problem of the extra man, or, I should say, an extra man, for both were equal. Never before in the history of the world had two men been absolutely identical. They were, of course, one in thought, possessions and rights, physical attributes and appearance. Mrs. Farrel, as they were beginning to realize, was the wife of both. And I have an unworthy suspicion that the red-headed young woman, after she recovered from the shock, was not entirely displeased. The two men, however, finding that each had an arm about her waist, were regarding each other in a way that foretold trouble.

Both spoke at the same time and in the same words.

"Take your hands off my wife!"

"And I think they would have attacked each other then if Drayle hadn't intervened. He said, 'Sit down! All of you!' in so peremptory a voice that we obeyed him.

"Now," he went on, 'pay attention to me. I think you realize the situation. The question is, what we shall do about it?' He pointed an accusing finger at the Farrel from Washington. 'You were not authorized to exist; properly we should retransmit you, and without reassembling you would simply cease to be.'

"The man addressed looked terrified. 'It would be murder!' he protested.

"Would it?' Drayle inquired of me.

"I told him that it could not be proved inasmuch as there would be no *corpus delicti* and hence nothing on which to base a charge.

"But the Washington Farrel seemed to have more than an academic interest in the question and grew obstinate.

"'Nothing doing!' he announced emphatically. 'Here I am and here I stay. I started from this place this morning and now I'm back, and as for that big ape over there I don't know nothing about him—except he'll be dead damn soon if he don't keep away from my wife.'

"The other Drayle-made man leaped up at this, and again I expected violence. But Buchannon flung himself between, and they subsided, muttering.

"'Very well, then,' Drayle continued, when the room was quiet, 'here is another solution. We can, as you realize, duplicate Mrs. Farrel, and I will double your present possessions.'

"This time it was Mrs. Farrel who was dissatisfied. 'You ain't talking to me,' she informed Drayle. 'Me stand naked in front of all them lamps and get turned into smoke? Not me!' A smile spread over her face

and her eyes twinkled with deviltry. 'I didn't never think I'd be in one of them triangles like in the movies, and with my own husbands, but seein' I am, I'm all for keeping them both. Then I might know where one of them was some of the time.'

"But neither of the men took to this idea and the problem appeared increasingly complex. I proposed that the survivor be determined by lot, but this suggestion won no support from anyone. Again the two men spoke at the same instant and in the same words. It was like a carefully rehearsed chorus. 'I know my rights, and I ain't going to be gypped out of them!'

"It was at this point that Drayle attempted bribery. He offered fifty thousand dollars to the man who would abandon Mrs. Farrel. But this scheme fell through because both men sought the opportunity and Mrs. Farrel objected volubly.

"So in the end Drayle promised each of them the same amount as a price for silence and left the matter of their relationships to their own settlement.

"I was skeptical of the success of the plan but could offer nothing better. So I drew up a release as legally binding as I knew how to make it in a case without precedent. I remember thinking that if the matter ever came into court the judge would be as much at a loss as I was.

"Our troubles, though, didn't spring from that source. Each of the three parties accepted the arrangement eagerly and Drayle dismissed them with a handshake, a wish for luck and a check for fifty thousand dollars each. It's very nice to be wealthy, you know.

"Afterward, we went out and paid off the police. Perhaps that's stating it too bluntly. I mean that Drayle thanked them for their zealous attention to his interests, regretted that they had been unnecessarily inconvenienced and treated that they would not take amiss a small token of his appreciation of their devotion to duty. Then he shook hands with them both and I believe I saw a yellow bill transferred on each occasion. At any rate the officers saluted smartly and left.

"Of course I was impatient to question Drayle, but I could see that he was desperately fatigued. So I departed.

"Next morning I found my worst fears exceeded by the events of the night. The three Farrels who had left us in apparently amiable spirits had proceeded to the home of Mrs. and the original Mr. Farrel. There the argument of who was to leave had been resumed. Both men were, of course, of the same mind. Whether both desired to stay or flee I would not presume to say. But an acrimonious dispute led to physical hostilities, and while Mrs. Farrel, according to accounts, cheered them on, they literally fought to the death. Being equally capable, there was naturally, barring interruption, no other possible outcome. I can well believe they employed the same tactics, swung the same blows, and died at the same instant.

"Mrs. Farrel, after carefully retrieving both of her husbands' checks, told a great deal of the story. As might be expected, nobody believed the yarn except our profound federal law makers. They welcomed an opportunity to investigate an outsider for a change

and had all of us before a committee.

"Finally the Congress of these United States of America, plus the sagacious Supreme Court, decided that my client wasn't guilty of anything, but that he mustn't do it again. At least that was the gist of it. I recollect that I offered a defense of psycopathic neuroticism.

"As a result of the *obiter dictum* and a resolution by both Houses Assembled Drayle's invention was sealed, dated and placed under guard. That's its history, Sergeant."

The white-haired old gentleman picked up the high silk hat that added a final touch of distinction to his tall figure, and looked about him as if trying to recall something. At last the idea came.

"By the way," he inquired suddenly, "didn't I have an extraordinarily obnoxious grandson with me when I came?"

The attentive auditor was vastly startled. He surveyed

the great hall rapidly, but reflected before he answered.

"No, sir—I mean he ain't no more'n average! But I reckon we'd better find him, anyhow."

His glance had satisfied the sergeant that at least the object of his charge was safe and his men still vigilant. "I'll be back in a minute," he informed them. "Don't let nothin' happen."

"Bring us something more'n a breath," pleaded the corporal, disrespectfully.

The sergeant had already set off at a brisk pace with the story teller. For several minutes as they rushed from room to room the hunt was unrewarded.

"I think, sir," said the sergeant, "we'd better look in the natural history division. There is stuffed animals in there that the kids is fond of."

"You're probably right," the patriarch gasped as he struggled to maintain the gait set by the younger

man. "I might have known he didn't really want to hear the story."

"They never do," answered the other over his shoulder. "I'll bet that's him down there on the next floor."

The two searchers had emerged upon a wide gallery that commanded a clear view of the main entrance where various specimens of American fauna were mounted in intriguing replicas of their native habitat.

The guard pointed an accusing finger at one of these groups and sprang toward the stairs.

The old gentleman's breath and strength were gone. He could only gaze in the direction that had been indicated by the madly running guard; but he had no doubts. A small boy was certainly digging vigorously at the head of a specimen of *Ursus Polaris* that the curator had represented in the dramatic pose of killing a seal. A protesting wail arose from below as the young naturalist was withdrawn from his field by a capable hand on the slack of his trousers. And

presently, chagrined with failure, the culprit was before his grandsire.

"Gee!" he complained, "I was only looking at the polar bear. Are polar bears always white? Are—"

"You'd better take him away, sir," interrupted the sergeant. "He was trying to pry out one of the bear's eyes with the stick of the lollypop I give him. Take him."

The old gentleman extended both hands. His left found a grip in his grandson's coat collar; his right, partly concealing a government engraving, met the guard's with a clasp of gratitude.

"Sergeant," he remarked in a voice tense with feeling, "a half-hour ago I expressed some ridiculous regrets that Drayle's invention had been kept from the world. Now I realize its horrid menace. I shudder to think it might have been responsible for two like him!"

The object of disapproval was shaken indicatively.

"Guard the secret well, Sergeant! Guard it well! The world's peace depends upon you!" The old gentleman's words trembled with conviction.

Then alternately shaking his head and his grandson he marched down the hallway, ebony cane tapping angrily upon the stone.

As the exhausted but happy warrior retraced his steps a high-pitched voice floated after him.

"Grandpa, are polar bears *always* white?"

November 1930

#55 The Wall Of Death, By Victor Rousseau Emanuel:

Out of the Antarctic it came—a wall of viscid, grey, half-human jelly, absorbing and destroying all life that it encountered.

Aproximate word count:

Bigotry:

Warnings:

hewing madly with

- - -

This news," said Cliff Hynes, pointing to the newspaper, "means the end of homo Americanus."

- - -

Out of the Antarctic it came—a wall of viscid, grey, half-human jelly, absorbing and destroying all life that it encountered.

The newspaper in question was the hour-sheet of the

International Broadcast Association, just delivered by pneumatic tube at the laboratory. It was stamped 1961, Month 13, Day 7, Horometer 3, and the headlines on the front page confirmed the news of the decisive defeat of the American military and naval forces at the hands of the Chinese Republic.

A gallant fight for days against hopeless odds; failure of the army dynamos; airships cut off from ground guidance; battleships ripped to pieces by the Chinese disintegrators; and, finally, the great wave of black death that had wiped out two hundred thousand men.

Kay Bevan—to use the old-fashioned names which still persisted, despite the official numerical nomenclature—glanced through the account. He threw the sheet away. "We deserved it, Cliff," he said.

Cliff nodded. "You saw that bit about the new Chinese disintegrator? If the Government had seriously considered our Crumbler—"

Kay glanced at the huge, humming top that filled the center of the laboratory. It spun so fast that it

appeared as nothing but a spherical shadow, through which one could see the sparse furnishings, the table, the apparatus ranged upon it, and the window overlooking the upper streets of New York.

"Yes—*if!*" he answered bitterly. "And I'm willing to bet the Chinese have an inferior machine, built upon the plans that Chinese servant stole from us last year."

"We deserved it, Cliff," said Kay again. "For ten years we've harried and enslaved the yellow man, and taken a hundred thousand of his men and women to sacrifice to the Earth Giants. What would we have done, if conditions had been reversed?"

"Self-preservation," Cliff suggested.

"Exactly. The law of the survival of the fittest. They thought that they were fitter to survive. I tell you they had right on their side, Cliff, and that's what's beaten us. Now—a hundred thousand of our *own* boys and girls must be fed into the maw of these monsters every year. God, suppose it were Ruth!"

"Or you or I," said Cliff. "If only we could perfect the Crumbler!"

"What use would that be against the Earth Giants? There's nothing organic about them, not even bones. Pure protoplasm!"

"We could have used it against the Chinese," said Cliff. "Now—" He shrugged his shoulders hopelessly.

And if explorers had been content to leave the vast unknown Antarctic Continent alone, they would never have taught the imprisoned Giants to cross the great ice barrier. But that crossing had taken place fifteen years ago, and already the mind of man had become accustomed to the grim facts.

Who could have dreamed that the supposed table-land was merely a rim of ice-mountains, surrounding a valley twice the size of Europe, so far below sea-level that it was warmed to tropic heat by Earth's interior fires? Or that this valley was peopled with what could best be described as organized protoplasm?

Enormous, half-transparent, gelatinous organism, attaining a height of about a hundred feet, and crudely organized into forms not unlike those of men?

Half the members of the Rawlins Expedition, which had first entered this valley, had fallen victims to the monsters. Most of the rest had gone raving mad. And the stories of the two who returned, sane, to Buenos Aires, were discredited and scoffed at as those of madmen.

But of a second expedition none had survived, and it was the solitary survivor of the third who had confirmed the amazing story. The giant monsters, actuated by some flickering human intelligence, had found their way out of the central valley, where they had subsisted by enfolding their vegetable and small animal prey with pseudopods, that is to say, temporary projections of arms from the gelatinous bulk of their substance.

They had floated across the shallow seas between the tip of the Antarctic Continent and Cape Horn, as toy balloons float on water. Then they had spread

northward, extending in a wall that reached from the Atlantic to the Andes. And, as they moved, they had devoured all vegetables and animal life in their path. Behind them lay one great bare, absolutely lifeless area.

How many of them were there? That was the hideous fact that had to be faced. Their numbers could not be counted because, after attaining a height of about a hundred feet, they reproduced by budding!

And within a few weeks these buds, in turn, attained their full development.

The Argentine Government had sent a force of twenty thousand men against them, armed with cannon, machine-guns, tanks, airplanes, poison gas, and the new death-ray. And in the night, when it was bivouacking, after what it had thought was glorious victory, it had been overwhelmed *and eaten!*

Proof against the poison gas, the hideous monsters were, and invulnerable to shot and shell. Divided and sub-divided, slashed into ribbons, blown to fragments

by bombs, each of the pieces simply became the nucleus of a new organism, able, within a few hours, to assume the outlines of a dwarf man, and to seize and devour its prey.

But the Argentine expedition had done worse than it at first dreamed of. *It had given the monsters a taste for human flesh!*

After that, the wave of devastation had obliterated life in every city clear up to the Amazonian forests. And then it had been discovered that, by feeding these devils human flesh, they could be rendered torpid and their advance stayed—so long as the periodical meals continued!

At first criminals had been supplied them, then natives, then Chinese, obtained by periodical war raids. What would you have? The savage regions of the earth had already been depopulated, and a frenzy of fear had taken possession of the whole world.

Now the Chinese had defeated the annual American invasion, and the Earth Giants were budding and

swarming through the heart of Brazil.

"Man," said the Theosophists, "is the fifth of the great root-races that have inhabited this planet. The fourth were the Atlanteans. The third were the Lemurians, half-human beings of whom the Australian aborigines are the survivors. The second race was not fully organized into human form. Of the first, nothing is known.

"These are the second race, surviving in the Antarctic valleys. Half-human objects, groping toward that perfection of humanity of which we ourselves fall very far short. As the Kabbala says, man, before Adam, reached from heaven to earth."

Kay Bevan and Cliff Hynes had been working feverishly to perfect their Crumbler for use in the Chinese wars. Convinced, as were all fair-minded men, that these annual raids were unjustified, they yielded to the logic of the facts. Should America sacrifice a hundred thousand of her boys and girls each year, when human life was cheap in China? *Boys and girls!*

It had been discovered that the Earth Giants required the flesh of women as well as of men. Some subtle chemical constituent then produced the state of torpidity during which the advance and the budding of the monsters was stayed. During the ten past years their northward advance had been almost inappreciable. Brazil had even sent another army against them.

But the deadliest gases had failed to destroy the tenacious life of these protoplasmic creatures, and the tanks, which had driven through and through them, had become entangled and blocked in the gelatinous exudations, and their occupants eaten.

All over the world scientists were striving to invent some way of removing this menace to the world. Moreover, airplanes sent to the polar continent had reported fresh masses mobilizing for the advance northward. A second wave would probably burst through the Amazon forest barrier and sweep over the Isthmus and overrun North America.

Five days after the news of the Chinese disaster was

confirmed, Cliff Hynes came back from the capital of the American Confederation, Washington.

"It's no use, Kay," he said. "The Government won't even look at the Crumbler. I told them it would disintegrate every inorganic substance to powder, and they laughed at me. And it's true, Kay: they've given up the attempt to enslave China. Henceforward a hundred thousand of our own citizens are to be sacrificed each year. Eaten alive, Kay! God, if only the Crumbler would destroy organic forms as well!"

The first year's quota of fifty thousand boys and fifty thousand girls, thrown to the maw of the monsters to save humanity, nearly disrupted the Confederation. Despite the utmost secrecy, despite the penalty of death for publishing news of the sacrifice, despite the fact that those who drew the fatal lots were snatched from their homes at dead of night, everything became known.

On the vast pampas in the extreme north of the Argentine Republic, where Bolivia, the Argentine, Paraguay and Brazil unite, was the place of sacrifice.

Thousands of acres, white with the bones of those whom the monsters had engulfed. Brainless, devoid of intelligence, sightless, because even the sense had not become differentiated in them, yet by some infernal instinct the Earth Giants had become aware that this was their feasting ground.

By some tacit compact, the guards who had annually brought their victims to be devoured had been unmolested, the vast wall of semi-human shapes withdrawing into the shelter of the surrounding forests while the Chinese were staked out in rows. Death, which would have been a mercy, had been denied them. It was living flesh that the Earth Giants craved. And here, on the spot known as Golgotha, the hideous sacrifice had been annually repeated.

That first year, when the chosen victims were transported to the fatal spot, all America went mad. Frenzied parents attacked the offices of the Federation in every city. The cry was raised that Spanish Americans had been selected in preference to those of more northern blood. Civil war loomed imminent.

And year after year these scenes must be repeated. Boys and girls, from fifteen to twenty years of age, the flower of the Federation, a hundred thousand of them, must die a hideous death to save humanity. Now the choice of the second year's victims was at hand.

In their laboratory, removed to the heart of the Adirondacks wilderness, Cliff and Kay were working frantically.

"It's the last chance, Kay," said Cliff. "If I've not solved the secret this time, it means another year's delay. The secret of dissolving organic forms as well as inorganic ones! What is this mysterious power that enables organic forms to withstand the terrific bombardment of the W-ray?"

The W-ray was the Millikan cosmic ray, imprisoned and adapted for human use. It was a million times more powerful than the highest known voltage of electricity. Beneath it, even the diamond, the hardest substance known, dissolved into a puff of dust; and yet the most fragile plant growth remained unaffected.

The laboratory in the Adirondacks was open at one end. Here, against a background of big forest trees, a curious medley of substances had been assembled: old chairs, a couple of broken-down airplanes, a large disused dynamo, a heap of discarded clothing, a miscellany of kitchen utensils on a table, a gas stove, and a heap of metal junk of all kinds. The place looked, in fact, like a junk heap.

The great top was set in a socket in a heavy bar of craolite, the new metal that combined the utmost tensile strength with complete infusibility, even in the electric furnace. About six feet in height, it looked like nothing but what it was, a gyroscope in gimbals, with a long and extremely narrow slit extending all around the central bulge, but closed on the operator's side by a sliding cover of the same craolite.

Within this top, which, by its motion, generated a field of electrical force between the arms of an interior magnet, the W-rays were generated in accordance with a secret formula; the speed of gyration, exceeding anything known on earth, multiplied their force a billionfold, converting them to wave-lengths

shorter than the shortest known to physical science. Like all great inventions, the top was of the simplest construction.

"Well," said Cliff, "you'd better bring out Susie."

Kay left the laboratory and went to the cabin beside the lake that the two men occupied. From her box in front of the stove a lady porcupine looked up lazily and grunted. Kay raised the porcupine; in the box, of course. Susie was constitutionally indolent, but one does not handle porcupines, however smooth their quills may lie.

Kay brought her to the heap of junk and placed the box on top of it. He went inside the laboratory. "I may as well tell you, Cliff. I wouldn't have brought Susie if I'd thought the experiment had the least chance of success," he said.

Cliff said nothing. He was bending over the wheel, adjusting a micrometer. "All ready, Kay?" he asked.

Kay nodded and stepped back. He swallowed hard.

He hated sacrificing Susie to the cause of science; he almost hoped the experiment would fail.

Cliff pressed a lever, and slowly the ponderous top began to revolve upon its axis. Faster, faster, till it was nothing but a blur. Faster yet, until only its outlines were visible. Cliff pressed a lever on the other side.

Nothing happened apparently, except for a cloudy appearance of the air at the open end of the laboratory. Cliff touched a foot lever. The top began to grow visible, its rotations could be seen; it ran slower, began to come to a stop.

The cloud was gone. Where the airplanes and other junk had been, was nothing but a heap of grayish dust. It was this that had made the cloud.

Nothing remained, except that impalpable powder against the background of the trees.

Kay caught Cliff's arm. "Look out!" he shouted, pointing to the heap. "Something's moving in there!"

Something was. A very angry lady porcupine was scrambling out, a *quillless* porcupine, with a white skin, looking like nothing so much as a large, hairless rat. Cliff turned to Kay.

"We've failed," he said briefly. "Too late for this year now."

"But—the quills?"

"Inorganic material. But even the bones remain intact because there's circulation in the marrow, you see. And the Earth Giants haven't even bones. They're safe—this year!"

He flung himself down under a tree, staring up at the sky in abject despair.

"Look, Kay, I've got my number!" Ruth Meade smiled as she handed Kay the ticket issued by the Government announcing the lottery number provided for each citizen.

One hundred thousand young people between the

ages of fifteen and twenty would be drawn for the sacrifice, and Ruth, being nineteen, had come within the limits, but this would be her last year. In a few weeks the Government would announce the numbers—drawn by a second lottery—of those who were condemned.

Then, before these had been made public, the victims would already have been seized and hurried to the airship depots in a hundred places, for conveyance to the hideous Golgotha of the pampas.

The chance that any individual would be among the fated ones was reasonably small. It was the fashion to make a jest of the whole business. Ruth smiled as she showed her ticket.

Kay stared at it. "Ruth, if—if anything happened to you I'd go insane. I'd—"

"Why this sudden ardor, Kay?"

Kay took Ruth's small hand in his. "Ruth, you mustn't play with me any more. You know I love you. And the

sight of that thing makes me almost insane. You do care, don't you?" And, as Ruth remained silent, "Ruth, it isn't Cliff Hymes, is it? I know you two are old friends. I'd rather it were Cliff than anybody else, if it had to be some one, but—tell me, Ruth!"

"It isn't Cliff," said Ruth slowly.

"Is it—some one else?"

"It's you, dear," answered Ruth. "It's always been you. It might have been Cliff if you hadn't come along. But he knows now it can never be he."

"Does he know it's me?" asked Kay, greatly relieved.

Ruth inclined her head. "He took it very finely," she said. "He said just what you've said about him. Oh, Kay, if only your experiment had succeeded, and the world could be free of this nightmare! What happened? Why couldn't you and Cliff make it destroy life?"

"I don't know, dear," answered Kay. "Iron and steel

melt into powder at the least impact of the rays. They are so powerful that there was even a leakage through the rubber and anelektron container. Even the craolite socket was partly fused, and that is supposed to be an impossibility. And there was a hole in the ground seven feet deep where the very mineral water in the earth had been dissolved. But against organic substances the W-ray is powerless.

"Next year, dear—next year we'll have solved our problem, and then we'll free the world of this menace, this nightmare. Ruth—don't let's talk about that now. I love you!"

They kissed. The Earth Giants faded out of their consciousness even while Ruth held that ominous ticket in her hand.

Kay said nothing to Cliff about it, but Cliff knew. Perhaps he had put his fate to the test with Ruth and learned the truth from her. Ruth made no reference to the matter when she saw Kay. But between the two men, friends for years, a coolness was inexorably developing.

They had gone to work on the new machine. They were hopeful. When they were working, they forgot their rivalry.

"You see, Kay," said Cliff, "we mustn't forget that the Millikan rays have been bombarding Earth since Earth became a planet, out of the depths of space. It is their very nature not to injure organic life, otherwise all life on Earth would have been destroyed long ago. Now, our process is only an adaptation of these cosmic rays. We haven't changed their nature."

"No," agreed Kay. "What we want is a death-ray strong enough to obliterate these monsters, without simply disintegrating them and creating new fragments to bud into the complete being. Why do you suppose they are so tenacious of life, Cliff?"

"They represent primeval man, life itself, striving to organize itself, and nothing is more tenacious than the life principle," answered Cliff.

Meanwhile the fatal weeks were passing. A few days after the tickets had been distributed, a Government

notice was broadcasted and published, ordaining that, in view of former dissensions, no substitutes for the condemned persons would be permitted. Rich or poor, each of the victims chosen by lot must meet his fate.

And the monsters were growing active. There had been an extension of their activities. Tongues had been creeping up the rivers that ran into the Amazon. Suddenly a dense mass of the devils had appeared on the north coast, near Georgetown. They had overleaped the Amazon; they were overrunning British Guiana, eating up everything on their way. Georgetown was abandoned; the monsters were in complete control.

"They will be cut off from the main herd," the optimistic reports announced. "We shall deal with the main herd first. This year the sacrifice will have to be made, but it will be the last. Scientists have at last hit upon an infallible toxin which will utterly destroy this menace within a few months."

Nobody believed that story, for everything had been tried and failed. In their laboratory Cliff and Kay were

working frantically. And now the coldness that had developed between them was affecting their collaboration too. Cliff was keeping something back from Kay.

Kay knew it. Cliff had made some discovery that he was not sharing with his partner. Often Kay, entering the laboratory, would find Cliff furtively attempting to conceal some operation that he was in the midst of. Kay said nothing, but a brooding anger began to fill his heart. So Cliff was trying to get all the credit for the result of their years of work together!

And always, in the back of his mind, there was a vision of the little Government ticket in Ruth's hand, with the numbers in staring black type. They had burned into his brain. He could never forget them. Often at night, after a hard day's work, he would suddenly awaken out of a hideous nightmare, in which he saw Ruth taken away by the agents of the Government, to be thrown as a sacrifice to the monsters.

And Cliff was hiding something! That made the

situation unbearable.

The coolness between the two men was rapidly changing into open animosity. And then one day, quite by chance, in Cliff's absence, Kay came upon evidence of Cliff's activities.

Cliff was no longer experimenting with the W-ray! He was using a new type of ray altogether, the next series, the psenium electron emanation discovered only a few years before, which had the peculiar property of non-alternation, even when the psenium electron changed its orbit around the central nucleus of the psenium atom.

Instead of discontinuity, the psenium electron had been found to emit radiation steadily, and this had upset the classic theories of matter for the ninth time in the past fifteen years.

And Kay's wrath broke loose in a storm of reproaches when Cliff came into the laboratory.

"You've been deliberately keeping me in the dark!" he

shouted. "You're a nice sort of partner to have! Here's where we split up the combination, Hynes!"

"I've been thinking that for a long time," sneered Cliff. "The fact is, Kay, you're a little too elementary in your ideas to suit me. It's due to you that I kept hammering away on the wrong tack for years. The sooner we part, the better."

"No time like now," said Kay. "Keep your laboratory. You put most of the money into it, anyway. I'll build me another—where I can work without being hampered by a partner who's out for himself all the time. Good luck to you in your researches, and I hope you'll get all the credit when you find a way of annihilating the Earth Giants."

And he stormed out of the laboratory, jumped into his plane, and winged his way southward toward his apartment in New York.

Crowds in the streets of every town on the way. In villages and hamlets, swarming like ants, and hurrying along the highways! Kay, who flew one of the

slow, old-fashioned planes, averaging little more than a hundred miles an hour, winged his way methodically overhead, too much absorbed in his anger against Cliff to pay much attention to this phenomenon at first. But gradually it was borne in upon him that something was wrong.

He flew lower, and now he was passing over a substantial town, and he could hear the shouts of anger that came up to him. The whole town was in a ferment, gathered in the town square.

Suddenly the reason came home to Kay. He saw the adjoining airport, and dropped like a plummet, hovering down until his wheels touched the ground. Without waiting to taxi into one of the public hangars, he leaped out and ran through the deserted grounds into the square.

Groans, yells, shrieks of derision rent the air. The whole crowd had gone maniacal. And it was as Kay had thought. Upon a white background high up on the town ball building, the numbers of the local boys and girls who had been picked for sacrifices were being

shown.

Eight boys and fifteen girls, already on their way into the wastes of South America, to meet a hideous death.

"They took my Sally," screamed a wizened woman, the tears raining down her checks. "Kidnapped her at the street corner after dark. I didn't know why she hadn't come home last night. God, my Sally, my little girl, gone—gone—"

"People, you must be patient," boomed the Government announcer. "The President feels with you in your affliction. But by next year a means will have been devised of destroying these monsters. Your children will have their sacrifice recorded in the Hall of Fame. They are true soldiers who—"

"To hell with the Government!" roared a man. "Stop that damn talk machine! Break her, fellows! Then we'll hang President Bogart from the top of the Capitol!"

Yells answered him, and the crowd surged forward toward the building.

"Stand back!" shrieked the announcer. "It's death to set foot on the step. We are now electrified. Last warning!"

The first ranks of the mob recoiled as a charge of electricity at a voltage just short of that required to take life coursed through their bodies. Shrieks of agony rang out. Files of writhing forms covered the ground.

Kay rushed to the automatic clerk at the window beside the metal steps, taking care to avoid contact with them. Within six feet, the temperature of his body brought the thermostatic control into action; the window slid upward and the dummy appeared. He turned the dial to Albany.

"I want New York Division, Sub-station F, Loyalist Registration," he called. "Give me Z numbers of the lottery, please."

"No numbers will be given out until Horometer 13," the dummy boomed.

"But I tell you I must know immediately!" Kay pleaded frantically.

"Stand away, please!"

"I've got to know, I tell you!"

"We are now electrified. Last warning!"

"Listen to me. My name's Kay Bevan. I—"

A mighty buffet in the chest hurled Kay ten feet backward upon the ground. He rose, came within the electric zone, felt his arms twisted in a giant's grasp, staggered back again and sat down gasping. The window went down noiselessly, the dummy swung back into place. Kay got upon his feet again, choking with impotent rage.

All about him men and women were milling in a frantic mob. He broke through them, went back to

where his plane was standing. A minute later he was driving madly toward the district airport in New York within three blocks of Ruth's apartment.

He dropped into a vacant landing place, checked hastily, and rushed into the elevator. Once in the upper street, he bounded to the middle platform, and, not satisfied to let it convey him at eight miles an hour, strode on through the indignant throng until he reached his destination. Hurling the crowds right and left he gained the exit, and a half-minute later was on the upper level of the apartment block.

He pushed past the janitor and raced along the corridor to Ruth's apartment. She would be in if all was well; she worked for the Broadcast Association, correcting the proofs that came from the district headquarters by pneumatic tube. He stopped outside the door. The little dial of white light showed him that the apartment was unoccupied.

As he stood there in a daze, hoping against hope, he saw a thread hanging from the crevice between door and frame. He pulled at it, and drew out a tiny strip of

scandium, the new compressible metal that had become fashionable for engagement rings. Plastic, all but invisible, it could be compressed to the thickness of a sheet of paper: it was the token of secret lovers, and Kay had given Ruth a ring of it.

It was the signal, the dreaded signal that Ruth had been on the lottery list—the only signal that she had been able to convey, since stringent precautions were taken to prevent the victims becoming known until all possibility of rescue was removed.

No chance of rescuing her! From a hundred airports the great Government airships had long since sailed into the skies, carrying those selected by the wheel at Washington for sacrifice to the Earth Giants. Only one chance remained. If Cliff had discovered the secret that had so long eluded them, surely he would reveal it to him now!

Their quarrel was forgotten. Kay only knew that the woman he loved was even then speeding southward to be thrown to the maw of the vile monsters that held the world in terror. Surely Cliff would bend every

effort to save her!

Only a few hours had passed since Kay had stormed out of the laboratory in the Adirondacks in a rage when he was back on their little private landing field. He leaped from the plane and ran up the trail beside the lake between the trees. The cabin was dark; and, when Kay reached the laboratory he found it dark too.

"Cliff! Cliff!" he shouted.

No answer came, and with a sinking heart he snapped the button at the door. It failed to throw the expected flood of light through the interior. With shaking hand Kay pulled the little electron torch from his pocket, and its bright beam showed that the door was padlocked. He moved round to the window. The glass was unbreakable, but the ray from the torch showed that the interior of the laboratory had been dismantled, and the great top was gone.

In those few hours Cliff, for reasons best known to himself, had removed the top, Kay's one hope of saving Ruth. And he was gone.

In that moment Kay went insane. He raved and cursed, calling down vengeance upon Cliff's head. Cliff's very motive was incredible. That he had deliberately removed the top in order that Ruth should die was not, of course, conceivable. But in that first outburst of fury Kay did not consider that.

Presently Kay's madness burned itself out. There was still one thing that he could do. His plane, slow though it was, would carry him to the pampas. He could get fresh fuel at numerous bootleg petrol stations, even though the regulations against intersectional flight were rigid. With luck he could reach the pampas, perhaps before the sluggish monsters had fallen upon their prey. It was said that the victims sometimes waited for days!

Something was rubbing against his leg, pricking it through his anklets. Kay looked down. A lady porcupine, with tiny new quills, was showing recognition, even affection, if such a spiny beast could be said to possess that quality.

Somehow the presence of the beast restored Kay's

mind to normal.

"Well, he's left us both in the lurch, Susie," he said.

"Good luck to you, beastie, and may you find a secure hiding place until your quills have grown."

Drowning men catch at straws. Kay snatched out his watch, and the illuminated dial showed that it was already two quintets past horometer 13. He darted back to the cabin. The door was unfastened, and his torch showed him that, though Cliff had evidently departed, and taken his things, the interior was much as it had been. When Kay picked up the telephotophone, the oblong dial flashed out. The instrument was in working order.

He turned the crank, and swiftly a succession of scenes flashed over the dial. On this little patch of glassite, Kay was actually making the spatial journey to Albany, each minutest movement of the crank representing a distance covered. The building of the New York Division appeared, and its appearance signified that Kay was telephonically connected. But there was no automatic voice attachment, an expense

that Kay and Cliff had decided would be unjustified. He had to rely upon the old-fashioned telephone, such as was still widely in use in rural districts. He took up the receiver.

"Sub-Station F, Loyalist Registration, please," he called.

"Speaking," said a girl's voice presently.

"I want the Z numbers. All from Z5 to ZA," said Kay.

And thus, in the dark hut, he listened to the doom pronounced, miles away, by a more or less indifferent operator. When the fatal number was read out, he thanked her and hung up. He released the crank, which moved back to its position, putting out the light on the dial.

For a moment or two he stood there motionless, in a sort of daze, though actually he was gathering all his reserves of resolution for the task confronting him. Simply to find Ruth among the hundred thousand victims, and die with her. A task stupendous in itself,

and yet Kay had no doubt that he would succeed, that he would be holding her in his arms when the tide of hell flowed over them.

He knew the manner of that death. The irresistible onset of the giant masses of protoplasm, the extrusion of temporary arms, or feelers, that would grasp them, drag them into the heart of the yielding substance, and slowly smother them to death while the life was drained from their bodies. It had been said the death was painless, but that was Government propaganda. But he would be holding Ruth in his arms. He'd find her: he had no doubt of that at all.

And, strangely enough, now that Kay knew the worst, now that not the slightest doubt remained, he was conscious of an elevation of spirits, a sort of mad recklessness that was perfectly indefinable.

Kay turned his torch into a corner of the kitchen. Yes, there was the thing subconsciousness had prompted him to seek. A long-shafted, heavy woodsman's ax, a formidable weapon at close quarters. Because it is the instinct of *homo Americanus* to die with a weapon in

his hands, rather than let himself be butchered helplessly, Kay snatched it up. He ran back to his plane. The gas tank was nearly empty, but there was petrol in the ice house beside the lake.

Kay wheeled the machine up to it, and filled up with gas and oil. All ready now! He leaped in, pressed the starter, soared vertically, helicopter wings fluttering like a soaring hawk's. Up to the passenger air lane at nine thousand: higher to twelve, the track of the international and supply ships; higher still, to the fourteen thousand ceiling of the antiquated machine. He banked, turned southward.

It was freezing cold up there, and Kay had no flying suit on him, but, between the passenger lane and the lane of the heliospheres, at thirty thousand, there was no air police. And he could afford to take no chances. The Government police would be on the lookout for a score such desperate men as he, bent on a similar mission. He drove the plane toward the Atlantic till a red glow began to diffuse itself beneath him, an area of conflagration covering square miles of territory.

Swooping lower, Kay could hear the sound of detonations, the roar of old-fashioned guns, while through the pall of lurid smoke came the long, violet flashes of atomic guns, cleaving lanes of devastation. New York was burning.

The frenzied populace had broken into revolt, seized the guns stored in the arsenals, and attacked the great Bronx fortress that stood like a mighty sentinel to protect the port.

A swarm of airships came into view, swirling in savage fight. Kay zoomed. It was not his battle.

Now New York lay behind him, and he was winging southward over the Atlantic. All night he flew. At dawn he came down in a coast hamlet for bootleg petrol and oil.

"You come from New York?" asked the Georgian.

"Hear there's war broke out up there."

"My war's down in Brazil," muttered Kay.

"Say, if them Giants comes up here yuh know what us folks is going to do? We're going to set the hounds on 'em. Yes, sirree, we've got a pack of bloodhounds, raised for jest that purpose. I guess that's something them wisecrackers at Washington ain't thought of. They took two little fellers from Hopetown, but they won't take nobody from here."

Kay fuelled up and resumed his flight southward.

After that it was a nightmare. The sun rose and set, alternating with the staring moon and stars. Kay crossed the Caribbean, sighted the South American coast, swept southward over the jungles of Brazil. He drank, but no food passed his lips. He had become a mechanism, set for on special purpose—self-immolation.

It was in a wide savannah among the jungles that he first caught sight of the monsters. At first he thought it was the rising dawn mist; then he began to distinguish a certain horrible resemblance to human forms, and swooped down, banking round and round the opening in the jungle until he could see clearly.

There were perhaps a score of them, an advance guard that had pushed forward from one of the main divisions. Men? Anthropoids, rather, for their sex was indistinguishable! Human forms ranging from a few feet to a hundred, composed apparently of a grayish jelly, propelling themselves clumsily on two feet, but floating rather than walking. Translucent, semi-transparent. Most horrible of all, these shadowy, spheroid creatures exhibited here and there buds of various sizes, which were taking on the similitude of fresh forms. And among them were the young, the buds that had fallen from the parent stems, fully formed humans of perhaps five or six feet, bouncing with a horrible playfulness among their sires.

As Kay soared some three hundred feet overhead, a young tapir came leaping out of the jungle and ran, apparently unconscious of their presence, right toward the monsters. Suddenly it stopped, and Kay saw that it was already encircled by coils of protoplasm, resembling arms, which had shot forth from the bodies of the devils.

Swiftly, despite its struggles and bleatings, the tapir

was drawn into the substance of the monsters, which seemed to fuse together and form a solid wall of protoplasm in all respects like the agglutination of bacteria under certain conditions.

Then the beast vanished in the wall, whose agitated churnings alone gave proof of its existence.

For perhaps ten minutes longer Kay remained hovering above the clearing. Then the bodies divided, resuming their separate shapes. And the white bones of the tapir lay in a huddled mass in the open.

Kay went mad. Deliberately he set down his plane, and, hatchet in hand, advanced upon the sluggish monsters. Shouting wildly, he leaped into their midst.

The fight that followed was like a nightmare fight. He lopped off the slow tentacles that sought to envelop him, he slashed the devils into long ribbons of writhing jelly, slashed until the substance blunted the ax; wiped it clean and leaped into their midst again, hewing until he could no longer raise his arm. Then he drew back and surveyed the scene before him.

It was dreadful enough to drive the last remnants of sanity from his brain. For every piece that he had cut from the monsters, every protoplasmic ribbon was reorganizing before his eyes into the semblance of a new creature. Where there had been a score, there were now five hundred!

Kay ran back to his plane, leaped in, and soared southward. His face was a grotesque mask of madness, and his cries rang out through the ether.

The victims were no longer chained to stakes. The Federation, which always acted with complete secrecy, had gone one better. It had engaged electrical engineers, kept them housed in secret places, transported them to Golgotha; and there a vast electrified field had been established, an open space whose boundaries were marked out by pillars of electron steel.

Between these pillars ran lines of electric force. To attempt to pass them meant—not death, for dead boys and girls were spurned by the devils—but a violent shock that hurled one backward.

On this great plain the hundred thousand victims sat huddled in the open. Food they had none, for no purpose was to be served by mitigating their last agonies. No shelter either, for the sight of buildings might delay the final phase. But high above the doomed there floated the flag of the Federation, on a lofty pole, a touch of ironic sentimentality that had commended itself to some mind at Washington.

Over a square mile of territory, ringed with jungle the victims lay. The majority of them ringed this terrain; that is to say, attempting to escape, they had been hurled back by the electrical charge, and, having no strength or will remaining, they had dropped where they had been hurled, and lay in apathetic resignation.

There had been screams and cries for mercy, and piteous scenes when the Government airships had deposited them there and flown away, but now an intense silence had descended upon the doomed. Resigned to their fate, they sat or lay in little silent groups, all eyes turned toward the gloomy jungle.

And everywhere within this jungle a wraith-like mist was forming at this dawn hour. From a thousand miles around, the devils were mustering for their prey, agglutinating, in order that the meal of one might become the meal of all.

Wisps of protoplasmic fog were stealing out through the trees, changing shape every instant, but always advancing: now presenting the appearance of an aligned regiment of huge, shadowy men, now nothing but a wall of semi-solid vapor. And still, with eyeballs straining in their sockets, the victims watched.

Suddenly all were seized with the same spasm of mad terror. Again they hurled themselves against the electrified lines, and again they were hurled back, masses of boys and girls tumbling against one another, and screaming in one wail that, could it have been heard in Washington, would have driven all insane. Again and again, till they fell back, panting and helpless. And solidly the wall of devils was creeping up from every side.

Ruth Deane, one of the few who had themselves in

control, lay some distance back from the electrified field. From the moment when she was surprised in her apartment by the Government representatives, she had known that there was no hope of escape.

She had slipped the ring off her finger, snapped the plastic metal, and attached it to a thread torn from her dress. She had managed to insert it in the door, hoping that Kay would find it. It would serve as a last message of love to him.

Every removal of a selected victim was in the nature of a kidnapping. At dead of night her apartment had been opened. She had been ordered to dress. Nothing could be written, no arrangements made. She was already considered as one dead.

She had been hurried out of the upper entrance to the monorail, which conveyed her in a special car to the landing station. A few minutes later she had been on her way to join the camp of other victims, a hundred miles away. Within two hours she was on her way southward.

Stunned by the tragedy, none of the victims had made much of an outcry. They had been given water by the airship police. No food for boys and girls already dead. Days and nights had passed, and now she was here, faint from exhaustion, and wondering at the despair shown by those others. What difference would it make in half an hour? Besides, that Government pamphlet had insisted that this death was painless!

But an immense longing to see Kay once more came over her. There had been a time when she thought she loved Cliff; then Kay had come into her life, and she had known that other affair was folly. She had never told Kay of the bitter scene between Cliff and herself, how he had raved against Kay and sworn to win her in the end.

Cliff had calmed down and apologized, and Ruth had never seen him again. She wished he had not taken it like that. But above all she wanted to see Kay, just to say good-by.

And she tried to send out her whole heart to him in an unspoken message of love that would surely somehow

convey itself to him.

The wall of devils was creeping up on every side, slowly, lethargically. The monsters took their time, because they knew they were invincible. The sobs and shrieks had died away. Collected into a mass almost as rigid as that of the Earth Giants, the victims waited, palsied as a rabbit that awaits the approach of the serpent.

A humming overhead. An airplane shooting down from the sky. Rescue? No. Only a solitary pilot, armed with a woodsman's ax.

Kay drifted down, touched ground, leaped to his feet. Chance had brought him within five hundred yards of where Ruth was standing. But Ruth had known who that lone flyer must be. She broke through the throng; she rushed to meet him. Her arms were around him.

"Kay, darling Kay!"

"Ruth, dearest!"

"I knew you'd come."

"I've come to die beside you!"

It was perhaps odd that it did not enter the head of either as a possibility that Kay should simply place Ruth in the plane and fly away with her to safety. Had the thought occurred to Kay, he might have been tempted. But such black treachery was something inconceivable by either. So long as the Federation remained, so long as man moved in an organized society, he was bound to his fellows, to fight, suffer, and die with them.

"Stand by me, Ruth. We're going down fighting."

They moved back toward the throng, which, momentarily stirred to hope by Kay's appearance, had fallen into the former apathy of despair. And now the monsters were beginning to enter the electrified zone at one point. As they passed the line of posts, the high tension current made their bodies luminous, but it had no appreciable effect upon them. They moved on, inevitably.

A score or so of semi-human forms, agglutinated into a mass, and yet individually discernible. They bore down slowly upon the crowd of victims, who pressed backward as they advanced. On the other sides, though they almost encircled the field of death, the monsters were making no maneuvers to entrap their prey. Their sluggish minds were incapable of conceiving anything of the kind. But for the electrified zone, the great majority of the victims could have effected their escape. The monsters were simply pressing forward to their meal; they did not interpret its capture in terms of strategy at all.

A new frenzy of horror seized the crowd. They fled, struggling back until the foremost in flight reached the other side of Golgotha, to be repulsed by the electrified zone there. They fell in tumbled heaps. Appalling shrieks rang through the air.

Another line of the monsters was seeping forward, converging toward the first. As the two lines met, they coalesced into a wall of protoplasm, a thousand feet in length by a hundred high. A wall out of which leered phantasmal faces, like those in a frieze.

Kay stood alone, his arm around Ruth. To follow the flying mob would but prolong the agony. He raised the ax. He looked into the girl's eyes. She understood, and nodded.

One last embrace, one kiss, and Kay placed her behind him. He sprang forward, shouting, and plunged into the very heart of the wall.

And Ruth, watching with eyes dilated with horror, saw it yield with a sucking sound, and saw Kay disappear within it.

She saw the hideous mass fold itself upon him, and a hundred extruded tentacles wave in the air as they blindly grappled for him. And then Kay had broken through, and was hewing madly with great sweeps of the ax that slashed great streamers of the amorphous tissue from the wall of protoplasm.

It recoiled and then folded once more, and Kay's mighty sweeps were slashing phantom limbs from phantom bodies; and lopping off tentacles that curled and coiled, and put forth caricatures of hands and

fingers, and then, uniting with other slashed off tentacles, began to mould themselves into the likeness of dwarf monsters. Kay's struggle was like that of a man fighting a fog, for again and again he broke through the wall, and always it reunited.

And behind it another wall of protoplasm was pressing forward, and on another side a wall was drifting up. As Kay stopped, panting, and momentarily free, Ruth saw that they were almost encircled.

She saw the nature of that fight. Inevitably that wall would close about them; and, though the bones of last year's victims had been gathered up and carried away by the Federation, she guessed what would occur.

She ran to Kay and dragged him back through the closing gap. It met behind them, and again they stood face to face with the devils. Only this time, instead of a wall of protoplasm, it was a veritable mountain that confronted them, and there could be no more breaking through.

Kay thought afterward that the one touch of absolute

horror was that the reforming monsters, the young ones growing visibly before his eyes, had the gamboling instinct of young lambs or other creatures. They were much more lively than the parent creatures.

By this time perhaps a third of the space within the electrified lines had been occupied by the devils. The wall was slowly and sluggishly advancing, and a fresh infiltration was drifting in on another side. As the victims were pressed closer and closer together in their flight, half of them seemed to go insane. They raced to and fro, laughing and screaming, flinging their arms aloft in extravagant gestures. One young fellow, rushing across the ground, hurled himself like a bolt from a catapult into the heart of the grisly mass, which opened and received him.

There was a struggle, a convulsion; then the mass moved on.

Kay wiped his ax. He stood beside Ruth, gathering strength and breath to fight again. What else was there to do?

Suddenly a humming sound came to his ears. Still some little distance from the monsters, he glanced back. The victims were shouting, staring upward. Over the tops of the jungle trees Kay saw a second airplane flying toward them, a larger one than the plane which he had flown.

It opened its helicopter wings and drifted downward. Kay saw a single pilot, and, in the baggage compartment something that at first he did not recognize. Then he recognized both this object and the aviator.

"It's Cliff," he whispered hoarsely. "He's brought the top!"

The crowd was milling about Cliff as he stepped out of the plane. Kay broke through their midst, shouting to them to clear a space, that it was their chance, their only chance. They heard him and obeyed. And Cliff and Kay clasped hands, and there was Ruth beside them.

The two men carried the top out of the baggage

compartment and set it up.

"Thank God I came in time," Cliff hissed. "How long have we got, Kay?"

"Five minutes, I think," Kay answered, glancing at the oncoming wall. "They're slow. Will it work, Cliff? God, when I found you'd gone last night—"

Cliff did not answer. Ignoring Kay's offer of assistance, he fitted the top tightly into its socket of craolite, much heavier than the former one. Beneath this, three heavy craolite legs formed a sort of tripod.

"I looked forward to this possibility, Kay," said Cliff, as he adjusted the top and turned the clamps that held it in position. "Sorry I had to deceive you, but you we're so set on the cosmic rays, and I knew the psenium emanations wouldn't appeal to you. You wouldn't have believed. I had a hunch Ruth would draw one of those numbers.... *How long?*"

The swaying masses of gray jelly were very near them. Cliff worked feverishly at the top.

"Let me help. Cliff!"

"No! I'm through! Stand back!" shouted Cliff.

Even then—he regretted it afterward, and knew that he would regret it to his dying day—even then the thought flashed through Kay's mind that Cliff wanted all the glory. Behind him the milling, screaming crowd was huddling, as if for protection. Slowly a wisp-like tentacle protruded from the advancing wall. Kay swung his ax and lopped it from the phantom body. But the wall was almost upon them, and from the other side it was advancing rapidly.

"I'm ready! Stand back!" Cliff turned upon Kay, his face white, his voice hoarse. "I've one request to make, Kay. Keep everybody back, including you and Ruth. Nobody is to come within twenty-five yards of this machine!"

"That shall be done," said Kay, a little bitterness in his tone.

"Ruth, I think I'm going to save you all." Cliff looked

into the girl's face for a moment. "Please stand back twenty-five yards," he repeated.

Kay took Ruth by the arm and drew her back. The crowd moved back, their pressure moving back the vast multitudes behind them. The vast mob was almost packed into the quarter of the Golgotha; there was scarcely room to move.

Kay saw Cliff press the lever.

Slowly the giant top began to whirl. Faster ... faster.... Now it was revolving so fast that it had become totally invisible. But Cliff was almost surrounded by the wall of jelly. Only his back could be seen, and then space was narrowing fast.

Kay gripped Ruth's arm tightly. He held his breath. The crowd, of whom only a small part knew what was taking place, was screaming with terror as the mass of jelly on the other side pressed them inexorably backward. And Cliff had almost vanished. Would the machine work? Was it possible that the psenium emanations would succeed where the Millikan rays,

the W-ray had failed?

Then of a sudden the air grew dark as night. Kay began to sneeze. He gasped for air. He was choking. He could see nothing, and he strained Ruth to him convulsively, while the terrified multitudes behind him set up a last wail of despair.

He could see nothing, and he stood with the ax ready for the onset of the monsters, more terrible now, in their invisibility, than before. Then of a sudden there sounded subterranean rumblings. The ground seemed to open almost under Kay's feet.

He leaped back, dragging Ruth with him. Slowly the dust was settling, the darkness lessening. A faint, luminous glow overhead revealed the sun. Kay was aware that Cliff had swung the top, so that the psenium rays were being brought to bear upon the second mass of the monsters on the other side.

The sun vanished in appalling blackness. Again the dust-choked air was almost unbreathable. The shrieks of the crowd died away in wheezing gasps; and then a

wilder clamor began.

"The earthquake! The earthquake!" a girl was shrilling. "God help us all!"

Kay stood still, clutching Ruth tightly in his arms. He dared not stir, for all the world seemed to be dissolving into chaos.

Slowly the dust began to settle again. Perhaps five minutes passed before the sunbeams began to struggle through. A cloud of grey dust still obscured everything. But the wall of protoplasm was gone!

Cliff's voice came moaning out of the murk, calling Kay's name.

Kay moved forward cautiously, still holding Ruth. He seemed to be skirting the edge of a vast crater. At the edge of it he found the top, revolving slowly. And Cliff's voice came from beside the top.

"Kay, we've won. Don't look at me. Don't let Ruth see me! Look down!"

Kay looked down into the bottomless pit, extending clear across the plain to the distant jungle. An enormous canyon cloven in the earth, filled with the slowly settling cloud of dust.

"They're there, Kay. Don't look this way!"

But Kay looked—and could see nothing except a pile of debris, from the bottom of which Cliff's voice issued.

"Cliff, you're not hurt?"

"A—a little. You must listen while I tell you how to clean up the monsters. It's the psenium emanation. It has the same effect when our method is applied to it. It disintegrates everything inorganic—not organic.

"I thought, if I couldn't get them, I'd crumble the earth away—bury them. They're underneath the debris, Kay, a mile deep, buried, beneath the impalpable powder that represented the inorganic salts and minerals of the earth. They'll never get out of that. Protoplasm needs oxygen. They'll trouble us

no more.

"You must take the top, Kay. Use our old method. You'll find its application to the psenium emanation written in a book fastened beneath the hood. Wipe out the rest of them. If any more come, you'll know how to deal with them."

"Cliff, you're not badly hurt?" Kay asked again.

"Don't look, I tell you! Keep Ruth away!"

But the dust was settling fast, and suddenly Ruth uttered a scream of fear.

And a strangled cry broke from Kay's throat as he looked down at what had been Cliff Hynes.

The man seemed to have become resolved into the same sort of protoplasm as the Earth Giants. He lay, a little heap, incredibly small, incredibly distorted. Flesh without bones, shapeless lumps of flesh where arms and legs and body frame should have been.

Cliff's voice came faintly. "You remember the leakage through the rubber and analektron container, Kay. The W-rays even fused the craolite socket. The psenium rays are stronger. They destroy even bone. They're fatal to the man who operates the machine, unless he follows the directions. I've written them out for you, but I had—no time—to apply them."

His voice broke off. Then, "Good luck to you and—Ruth, Kay," he whispered, absent inaudibly. "Don't let—her—look at me."

Kay led Ruth gently away. "Did you hear that?" she whispered, sobbing. "He died to save us Kay."

It was like a return from the grave for the amazed boys and girls who—since the onset of the monsters had destroyed the electric lines—poured out of the plain of Golgotha to life and freedom.

Many of them had gone mad, a few had died of fright, but the rest would come back to normal, and the world was saved.

Hunger was their greatest problem, for, despite Kay's hurried flight to the nearest occupied post, it was difficult to convince the Federation officials that the devils were really gone, buried beneath a mile of crumbled earth. And Kay had to be back to mop up other, smaller bands that had spread through the forests.

It was six months before the last of the monsters had been obliterated, and then Kay, now one of the highest officials in the Federation's service, was granted a lunarian's leave of absence pending his taking command of an Antarctic expedition for the purpose of destroying the remaining monsters in their lair.

He took this opportunity to be married to Ruth, in the church in his native town, which was *en fête* for the occasion.

"Thinking of Cliff?" Kay asked his bride, as she settled in his plane preparatory to their starting for the honeymoon in the Adirondacks. "I think he would be happy if he knew. He saved the world, dear; he gave

his best. And that was all he wanted."

#56 The Pirate Planet, By Charles Willard Diffin:

A strange light blinks on Venus, and over old Earth hovers a mysterious visitant—dread harbinger of interplanetary war.

Chapter 1

Lieutenant McGuire threw open his coat with its winged insignia of the air force and leaned back in his chair to read more comfortably the newspaper article.

A strange light blinks on Venus, and over old Earth hovers a mysterious visitant—dread harbinger of interplanetary war.

He glanced at Captain Blake across the table. The captain was deep in a game of solitaire, but he looked up at McGuire's audible chuckle.

"Gay old girl!" said Lieutenant McGuire and smoothed the paper across his knees. "She's getting flirtatious."

The captain swore softly as he gathered up his cards. "Not interested," he announced; "too hot to-night. Keep her away."

"Oh, she's far enough away," McGuire responded; "about seventy million miles. Don't get excited."

"What are you talking about?" The captain shuffled his cards irritably.

"Venus. She's winking at us, the old reprobate. One of these star-gazers up on Mount Lawson saw the flashes a week or so ago. If you'll cut out your solitaire and listen, I'll read you something to improve your mind." He ignored the other's disrespectful remark and held the paper closer to see the paragraphs.

"Is Venus Signalling?" inquired the caption which Lieutenant McGuire read. "Professor Sykes of Mt. Lawson Observatory Reports Flashes.

"The planet Venus, now a brilliant spectacle in the evening sky, is behaving strangely according to a report from the local observatory on Mount Lawson. This sister star, most like Earth of all the planets, is now at its eastern elongation, showing like a half-moon in the big telescopes on Mt. Lawson. Shrouded in impenetrable clouds, its surface has never been seen, but something is happening there. Professor Sykes reports seeing a distinct flash of light upon the terminator, or margin of light. It lasted for several seconds and was not repeated.

"No explanation of the phenomenon is offered by scientists, as conditions on the planet's surface are unknown. Is there life there? Are the people of Venus trying to communicate? One guess is as good as another. But it is interesting to recall that our scientists recently proposed to send a similar signal from Earth to Mars by firing a tremendous flare of magnesium.

"Venus is now approaching the earth; she comes the nearest of all planets. Have the Venusians penetrated their cloak of cloud masses with a visible light? The planet will be watched with increased interest as it swings toward us in space, in hope of there being a repetition of the unexplained flash."

"There," said Lieutenant McGuire,"—doesn't that elevate your mind? Take it off this infernally hot night? Carry you out through the cool reaches of interplanetary space? If there is anything else you want to know, just ask me."

"Yes," Captain Blake agree, "there is. I want to know how the game came out back in New York—and you don't know that. Let's go over and ask the radio man. He probably has the dope."

"Good idea," said McGuire; "maybe he has picked up a message from Venus; we'll make a date." He looked vainly for the brilliant star as they walked out into the night. There were clouds of fog from the nearby Pacific drifting high overhead. Here and there stars showed momentarily, then were blotted from sight.

The operator in the radio room handed the captain a paper with the day's scores from the eastern games. But Lieutenant McGuire, despite his ready amusement at the idea, found his thoughts clinging to the words he had read. "Was the planet communicating?" he pictured the great globe—another Earth—slipping silently through space, coming nearer and nearer.

Did they have radio? he wondered. Would they send recognizable signals—words—or some mathematical sequence to prove their reality? He turned to the radio operator on duty.

"Have you picked up anything peculiar," he asked, and laughed inwardly at himself for the asking. "Any new dots and dashes? The scientists say that Venus is calling. You'll have to be learning a new code."

The man glanced at him strangely and looked quickly away.

"No, sir," he said. And added after a pause: "No new dots and dashes."

"Don't take that stuff too seriously, Mac," the captain remonstrated. "The day of miracles is past; we don't want to commit you to the psychopathic ward. Now here is something real: the Giants won, and I had ten dollars on them. How shall we celebrate?"

The radio man was listening intently as they started to leave. His voice was hesitating as he stopped them; he seemed reluctant to put his thoughts into words.

"Just a minute, sir," he said to Captain Blake.

"Well?" the captain asked. And again the man waited before he replied. Then—

"Lieutenant McGuire asked me," he began, "if I had heard any strange dots and dashes. I have not; but ... well, the fact is, sir, that I have been getting some mighty queer sounds for the past few nights. They've got me guessing.

"If you wouldn't mind waiting. Captain; they're about due now—" He listened again to some signal inaudible to the others, then hooked up two extra head-sets for

the officers.

"It's on now," he said. "If you don't mind—"

McGuire grinned at the captain as they took up the ear-phones. "Power of suggestion," he whispered, but the smile was erased from his lips as he listened. For in his ear was sounding a weird and wailing note.

No dots or dashes, as the operator had said, but the signal was strong. It rose and fell and wavered into shrill tremolos, a ghostly, unearthly sound, and it kept on and on in a shrill despairing wail. Abruptly it stopped.

The captain would have removed the receiver from his ear, but the operator stopped him. "Listen," he said, "to the answer."

There was silence, broken only by an occasional hiss and crackle of some far distant mountain storm. Then, faint as a whisper, came an answering, whistling breath.

It, too, trembled and quavered. It went up—up—to the limit of hearing; then slid down the scale to catch and tremble and again ascend in endless unvarying ups and downs of sound. It was another unbroken, unceasing, but always changing vibration.

"What in thunder is that?" Captain Blake demanded.

"Communication of some sort, I should say," McGuire said slowly, and he caught the operator's eyes upon him in silent agreement.

"No letters," Blake objected; "no breaks; just that screech." He listened again. "Darned if it doesn't almost seem to say something," he admitted.

"When did you first hear this?" he demanded of the radio man.

"Night before last, sir. I did not report it. It seemed too—too—"

"Quite so," said Captain Blake in understanding, "but it is some form of broadcasting on a variable wave;

though how a thing like that can make sense—"

"They talk back and forth," said the operator; "all night, most. Notice the loud one and the faint one; two stations sending and answering."

Captain Blake waved him to silence. "Wait—wait!" he ordered. "It's growing louder!"

In the ears of the listening men the noise dropped to a loud grumble; rose to a piercing shriek; wavered and leaped rapidly from note to note. It was increasing; rushing upon them with unbearable sound. The sense of something approaching, driving toward them swiftly, was strong upon Lieutenant McGuire. He tore the head-phones from his ears and rushed to the door. The captain was beside him. Whoever—whatever—was sending that mysterious signal was coming near—but was that nearness a matter of miles or of thousands of miles?

They stared at the stormy night sky above. A moon was glowing faintly behind scudding clouds, and the gray-black of flying shadows formed an opening as

they watched, a wind-blown opening like a doorway to the infinity beyond, where, blocking out the stars, was a something that brought a breath-catching shout from the watching men.

Some five thousand feet up in the night was a gleaming ship. There were rows of portholes that shone twinkling against the black sky—portholes in multiple rows on the side. The craft was inconceivably huge. Formless and dim of outline in the darkness, its vast bulk was unmistakable.

And as they watched with staring, incredulous eyes, it seemed to take alarm as if it sensed the parting of its concealing cloud blanket. It shot with dizzy speed and the roar of a mighty meteor straight up into the night. The gleam of its twinkling lights merged to a distant star that dwindled, shrank and vanished in the heights.

The men were wordless and open-mouthed. They stared at each other in disbelief of what their eyes had registered.

"A liner!" gasped Captain Blake. "A—a—liner! Mac, there is no such thing."

McGuire pointed where the real cause of their visitor's departure appeared. A plane with engine wide open came tearing down through the clouds. It swung in a great spiral down over the field and dropped a white flare as it straightened away; then returned for the landing. It taxied at reckless speed toward the hangars and stopped a short distance from the men. The pilot threw himself out of the cockpit and raced drunkenly toward them.

"Did you see it?" he shouted, his voice a cracked scream. "Did you see it?"

"We saw it," said Captain Blake; "yes, we saw it. Big as—" He sought vainly for a proper comparison, then repeated his former words: "Big as an ocean liner!"

The pilot nodded; he was breathing heavily.

"Any markings?" asked his superior. "Anything to identify it?"

"Yes, there were markings, but I don't know what they mean. There was a circle painted on her bow and marks like clouds around it, but I didn't have time to see much. I came out of a cloud, and there the thing was. I was flying at five thousand, and they hung there dead ahead. I couldn't believe it; it was monstrous; tremendous. Then they sighted me, I guess, and they up-ended that ship in mid-air and shot straight up till they were out of sight."

It was the captain's turn to nod mutely.

"There's your miracle," said Lieutenant McGuire softly.

"Miracle is right," agreed Captain Blake; "nothing less! But it is no miracle of ours, and I am betting it doesn't mean any good to us. Some other country has got the jump on us."

To the pilot he ordered: "Say nothing of this—not a word—get that? Let me have a written report: full details, but concise as possible."

He went back to the radio room, and the operator there received the same instructions.

"What are you going to do?" the lieutenant questioned.

Captain Blake was reaching for a head-set. "Listen in," he said briefly; "try to link up that impossible ship with those messages, then report at once to the colonel and whoever he calls in. I'll want you along, Mac, to swear I am sober."

He had a head-set adjusted, and McGuire took up the other. Again the room was still, and again from the far reaches of space the dark night sent to them its quavering call.

The weird shrillness cried less loudly now, and the men listened in strained silence to the go and come of that variable shriek. Musical at times as it leaped from one clear note to another, again it would merge into discordant blendings of half-tones that sent shivers of nervous reaction up the listeners' spines.

"Listen," said McGuire abruptly. "Check me on this. There are two of them, one loud and one faint—right?"

"Right," said Captain Blake.

"Now notice the time intervals—there! The faint one stops, and the big boy cuts in immediately. No waiting; he answers quickly. He does it every time."

"Well?" the captain asked.

"Listen when he stops and see how long before the faint one answers. Call the loud one the ship and the faint one the station.... There! The ship is through!"

There was pause; some seconds elapsed before the answer that whispered so faintly in their ears came out of the night.

"You are right, sir," the operator said in corroboration of McGuire's remark. "There is that wait every time."

"The ship answers at once," said McGuire; "the

station only after a wait."

"Meaning—?" inquired the captain.

"Meaning, as I take it, that there is time required for the message to go from the ship to the station and for them to reply."

"An appreciable time like that," Captain Blake exclaimed, "—with radio! Why, a few seconds, even, would carry it around the world a score of times!"

Lieutenant McGuire hesitated a moment. "It happens every time," he reminded the captain: "it is no coincidence. And if that other station is out in space—another ship perhaps, relaying the messages to yet others between here and—Venus, let us say...."

He left the thought unfinished. Captain Blake was staring at him as one who beholds a fellow-man suddenly insane. But the look in his eyes changed slowly, and his lips that had been opened in remonstrance came gradually in a firm, straight line.

"Crazy!" he said, but it was apparent that he was speaking as much to himself as to McGuire. "Plumb, raving crazy!... Yet that ship *did* go straight up out of sight—an acceleration in the upper air beyond anything we know. It might be—" And he, too, stopped at the actual voicing of the wild surmise. He shook his head sharply as if to rid it of intruding, unwelcome thoughts.

"Forget that!" he told McGuire, and repeated it in a less commanding tone. "Forget it, Mac: we've got to render a report to sane men, you and I. What we know will be hard enough for them to believe without any wild guesses.

"That new craft is real. It has got it all over us for size and speed and potential offensive action. Who made it? Who mans it? Red Russia? Japan? That's what the brass hats will be wondering; that's what they will want to find out.

"Not a word!" he repeated to the radio man. "You will keep mum on this."

He took McGuire with him as he left to seek out his colonel. But it was a disturbed and shaken man, instead of the cool, methodical Captain Blake of ordinary days, who went in search of his commanding officer. And he clung to McGuire for corroboration of his impossible story.

There was a group of officers to whom Blake made his full report. Colonel Boynton had heard but little when he halted his subordinate curtly and reached for a phone. And his words over that instrument brought a quick conference of officers and a quiet man whom McGuire did not recognize. The "brass hats," as Blake had foreseen, were avid for details.

The pilot of the incoming plane was there, too, and the radio man. Their stories were told in a disconcerting silence, broken only by some officer's abrupt and skeptical question on one point and another.

"Now, for heaven's sake, shut up about Venus," McGuire had been told. But he did not need Captain Blake's warning to hold himself strictly to what he

had seen and let the others draw their own conclusions.

Lieutenant McGuire was the last one to speak. There was silence in the office of Colonel Boynton as he finished, a silence that almost echoed from the grim walls. And the faces of the men who gathered there were carefully masked from any expression that might betray their thoughts.

It was the quiet man in civilian attire who spoke first. He sat beside another whose insignia proclaimed him of general's rank, but he addressed himself to Colonel Boynton.

"I am very glad," he said quietly, "very glad. Colonel, that my unofficial visit came at just this time. I should like to ask some few questions."

Colonel Boynton shifted the responsibility with a gesture almost of relief. "It is in your hands. Mr. Secretary," he said. "You and General Clinton have dropped in opportunely. There is something here that will tax all our minds."

The man in civilian clothes nodded assent. He turned to Captain Blake.

"Captain," he said, "you saw this at first hand. You have told us what you saw. I should like greatly to know what you think. Will you give us your opinion, your impressions?"

The captain arose smartly, but his words came with less ease.

"My opinion," he stated, "will be of little value, but it is based upon these facts. I have seen to-night, sir, a new type of aircraft, with speed, climb and ceiling beyond anything we are capable of. I can only regard it as a menace. It may or may not have been armed, but it had the size to permit the armament of a cruiser; it had power to carry that weight. It hung stationary in the air, so it is independent of wing-lift, yet it turned and shot upward like a feather in a gale. That spells maneuverability.

"That combination, sir, can mean only that we are out-flown, out-maneuvered and out-fought in the air. It

means that the planes in our hangars are obsolete, our armament so much old iron.

"The menace is potential at present. Whether it is an actual threat or not is another matter. Who mans that ship—what country's insignia she carries—is something on which I can have no opinion. The power is there: who wields it I wish we knew."

The questioner nodded at the conclusion of Blake's words, and he exchanged quiet, grave glances with the general beside him. Then—

"I think we all would wish to know that, Captain Blake," he observed. And to the colonel: "You may be able to answer that soon. It would be my idea that this craft should be—ah—drawn out, if we can do it. We would not attack it, of course, until its mission is proved definitely unfriendly, but you will resist any offensive from them.

"And now," he added, "let us thank these officers for their able reports and excuse them. We have much to discuss...."

Captain Blake took McGuire's arm as they went out into the night. And he drew him away where they walked for silent minutes by themselves. The eyes of Lieutenant McGuire roamed upward to the scudding clouds and the glimpse of far, lonely stars; he stumbled occasionally as he walked. But for Captain Blake there was thought only of matters nearby.

"The old fox!" he exclaimed. "Didn't he 'sic us on' neatly? If we mix it with that stranger there will be no censure from the Secretary of War."

"I assumed that was who it was," said McGuire. "Well, they have something to think about, that bunch; something to study over.... Perhaps more than they know."

"And that's their job," he concluded after a silence. "I'm going to bed; but I would like a leave of absence to-morrow if that's O. K."

"Sure," said Captain Blake, "though I should think you would like to stick around. Perhaps we will see something. What's on your mind, Mac?"

"A little drive to the top of Mount Lawson," said Lieutenant McGuire. "I want to talk to a bird named Sykes."

Chapter 2

Lieutenant McGuire, U. S. A., was not given as a usual thing to vain conjectures, nor did his imagination carry him beyond the practical boundaries of accepted facts. Yet his mind, as he drove for hours through the orange-scented hills of California, reverted time and again to one persistent thought. And it was with him still, even when he was consciously concentrating on the hairpin turns of Mount Lawson's narrow road.

There was a picture there, printed indelibly in his mind—a picture of a monstrous craft, a liner of the air, that swung its glowing lights in a swift arc and, like a projectile from some huge gun, shot up and up and still up until it vanished in a jet-black sky. Its altitude when it passed from sight he could not even guess, but the sense of ever-increasing speed, of power that mocked at gravitation's puny force, had struck deep into his mind. And McGuire saw plainly this mystery ship going on and on far into the empty night where man had never been.

No lagging in that swift flight that he had seen; an acceleration that threw the ship faster and yet faster, regardless of the thin air and the lessened buoyancy in an ocean of atmosphere that held man-made machines so close to Earth. That constant acceleration, hour after hour, day after day—the speed would be almost unlimited; inconceivable!

He stopped his car where the mountain road held straight for a hundred feet, and he looked out over the coastal plain spread like a toy world far below.

"Now, how about it?" he asked himself. "Blake thinks I am making a fool of myself. Perhaps I am. I wonder. It's a long time since I fell for any fairy stories. But this thing has got me. A sort of hunch, I guess."

The sun was shining now from a vault of clear blue. It was lighting a world of reality, of houses where people lived their commonplace lives, tiny houses squared off in blocks a mile below. There was smoke here and there from factories; it spread in a haze, and it meant boilers and engines and sound practical machinery of a practical world to the watching man.

What had all this to do with Venus? he asked himself. This was the world he knew. It was real; space was impenetrable; there were no men or beings of any sort that could travel through space. Blake was right: he was on a fool's errand. They couldn't tell him anything up here at the observatory; they would laugh at him as he deserved....

Wondering vaguely if there was a place to turn around, he looked ahead and then up; his eyes passed from the gash of roadway on the mountainside to the deep blue beyond. And within the man some driving, insistent, mental force etched strongly before his eyes that picture and its problem unanswered. There was the ship—he saw it in memory—and it went up and still up; and he knew as surely as if he had guided the craft that the meteor-like flight could be endless.

Lieutenant McGuire could not reason it out—such power was beyond his imagining—but suddenly he dared to believe, and he knew it was true.

"Earthbound!" he said in contempt of his own human kind, and he looked again at the map spread below.

"Ants! Mites! That's what we are—swarming across the surface of the globe. And we think we're so damn clever if we lift ourselves up a few miles from the surface!

"Guess I'll see Sykes," he muttered aloud. "He and his kind at least dare to look out into space; take their eyes off the world; be impractical!"

He swung the car slowly around the curve ahead, eased noiselessly into second gear and went on with the climb.

There were domed observatories where he stopped: rounded structures that gleamed silvery in the air; and offices, laboratories: it was a place of busy men. And Professor Sykes, he found, was busy. But he spared a few minutes to answer courteously the questions of this slim young fellow in the khaki uniform of the air service.

"What can I do for you?" asked Professor Sykes.

"No dreamer, this man," thought McGuire as he

looked at the short, stocky figure of the scientist. Clear eyes glanced sharply from under shaggy brows; there were papers in his hand scrawled over with strange mathematical symbols.

"You can answer some fool questions," said Lieutenant McGuire abruptly, "if you don't mind."

The scientist smiled broadly. "We're used to that," he told the young officer; "you can't think of any worse ones than those we have heard. Have a chair."

McGuire drew a clipping from his pocket—it was the newspaper account he had read—and he handed it to Professor Sykes.

"I came to see you about this," he began.

The lips of Professor Sykes lost their genial curve; they straightened to a hard line. "Nothing for publication," he said curtly. "As usual they enlarged upon the report and made assumptions and inferences not warranted by facts."

"But you did see that flash?"

"By visual observation I saw a bright area formed on the terminator—yes! We have no photographic corroboration."

"I am wondering what it meant."

"That is your privilege—and mine," said the scientist coldly.

"But it said there," McGuire persisted, "that it might have been a signal of some sort."

"*I* did not say so: that is an inference only. I have told you, Lieutenant"—he glanced at the card in his hand—"—Lieutenant McGuire—all that I know. We deal in facts up here, and we leave the brilliant theorizing to the journalists."

The young officer felt distinctly disconcerted. He did not know exactly what he had expected from this man—what corroboration of his wild surmises—but he was getting nowhere, he admitted. And he resented

the cold aloofness of the scientist before him.

"I am not trying to pin you down on anything," he said, and his tone carried a hint of the nervous strain that had been his. "I am trying to learn something."

"Just what?" the other inquired.

"Could that flash have been a signal?"

"You may think so if you wish: I have told you all that I know. And now," he added, and rose from his chair, "I must ask to be excused; I have work to do."

McGuire came slowly to his feet. He had learned nothing; perhaps there was nothing to be learned. A fool's errand! Blake was right. But the inner urge for some definite knowledge drove him on. His eyes were serious and his face drawn to a scowl of earnestness as he turned once more to the waiting man.

"Professor Sykes," he demanded, "just one more question. Could that have been the flash of a—a rocket? Like the proposed experiments in Germany.

Could it have meant in any way the launching of a projectile—a ship—to travel Earthward through space?"

Professor Sykes knew what it was to be harassed by the curious mob, to avoid traps set by ingenious reporters, but he knew, too, when he was meeting with honest bewilderment and a longing for knowledge. His fists were placed firmly on the hips of his stocky figure as he stood looking at the persistent questioner, and his eyes passed from the intent face to the snug khaki coat and the spread wings that proclaimed the wearer's work. A ship out of space—a projectile—this young man had said.

"Lieutenant," he suggested quietly—and again the smile had returned to his lips as he spoke—"sit down. I'm not as busy as I pretend to be. Now tell me: what in the devil have you got in your mind?"

And McGuire told him. "Like some of your dope," he said, "this is not for publication. But I have not been instructed to hush it up, and I know you will keep it to yourself."

He told the clear-eyed, listening man of the previous night's events. Of the radio's weird call and the mystery ship.

"Hallucination," suggested the scientist. "You saw the stars very clearly, and they suggested a ship."

"Tell that to Jim Burgess," said McGuire: "he was the pilot of that plane." And the scientist nodded as if the answer were what he expected.

He asked again about the ship's flight. And he, too, bore down heavily upon the matter of acceleration in the thin upper air. He rose to lay a friendly hand on McGuire's shoulder.

"We can't know what it means," he said, "but we can form our own theories, you and I—and anything is possible.

"It is getting late," he added, "and you have had a long drive. Come over and eat; spend the night here. Perhaps you would like to have a look at our equipment—see Venus for yourself. I will be observing

her through the sixty-inch refractor to-night. Would you care to?"

"Would I?" McGuire demanded with enthusiasm. "Say, that will be great!"

The sun was dropping toward the horizon when the two men again came out into the cool mountain air.

"Just time for a quick look around," suggested Professor Sykes, "if you are interested."

He took the lieutenant first to an enormous dome that bulged high above the ground, and admitted him to the dark interior. They climbed a stairway and came out into a room that held a skeleton frame of steel. "This is the big boy," said Professor Sykes, "the one hundred-inch reflector."

There were other workers there, one a man standing upon a raised platform beside the steel frame, who arranged big holders for photographic plates. The slotted ceiling opened as McGuire watched, and the whole structure swung slowly around. It was still, and

the towering steel frame began to swing noiselessly when a man at a desk touched various controls. McGuire looked about him in bewilderment.

"Quite a shop," he admitted; "but where is the telescope?"

Professor Sykes pointed to the towering latticework of steel. "Right there," he said. "Like everyone else, you were expecting to see a big tube."

He explained in simple words the operation of the great instrument that brought in light rays from sources millions of light years away. He pointed out where the big mirror was placed—the one hundred-inch reflector—and he traced for the wondering man the pathway of light that finally converged upon a sensitized plate to catch and record what no eye had ever seen.

He checked the younger man's flow of questions and turned him back toward the stairs. "We will leave them to their work," he said; "they will be gathering light that has been traveling millions of years on its

ways. But you and I have something a great deal nearer to study."

Another building held the big refractor, and it was a matter of only a few seconds and some cryptic instructions from Sykes until the eye-piece showed the image of the brilliant planet.

"The moon!" McGuire exclaimed in disappointed tones when the professor motioned him to see for himself. His eyes saw a familiar half-circle of light.

"Venus," the professor informed him. "It has phases like the moon. The planet is approaching; the sun's light strikes it from the side." But McGuire hardly heard. He was gazing with all his faculties centered upon that distant world, so near to him now.

"Venus," he whispered half aloud. Then to the professor: "It's all hazy. There are no markings—"

"Clouds," said the other. "The goddess is veiled; Venus is blanketed in clouds. What lies underneath we may never know, but we do know that of all the planets

this is most like the earth; most probably is an inhabited world. Its size, its density, your weight if you were there—and the temperature under the sun's rays about double that of ours. Still, the cloud envelope would shield it."

McGuire was fascinated, and his thoughts raced wildly in speculation of what might be transpiring before his eyes. People, living in that tropical world; living and going through their daily routine under that cloud-filled sky where the sun was never seen. The margin of light that made the clear shape of a half-moon marked their daylight and dark; there was one small dot of light forming just beyond that margin. It penetrated the dark side. And it grew, as he watched, to a bright patch.

"What is that?" he inquired abstractedly—his thoughts were still filled with those beings of his imagination. "There is a light that extends into the dark part. It is spreading—"

He found himself thrust roughly aside as Professor Sykes applied a more understanding eye to the

instrument.

The professor whirled abruptly to his assistant. "Phone Professor Giles," he said sharply; "he is working on the reflector. Tell him to get a photograph of Venus at once; the cloud envelope is broken." He returned hurriedly to his observations. One hand sketched on a waiting pad.

"Markings!" he said exultantly. "If it would only hold!... There, it is closing ... gone...."

His hand was quiet now upon the paper, but where he had marked was a crude sketch of what might have been an island. It was "L" shaped; sharply bent.

"Whew!" breathed Professor Sykes and looked up for a moment. "Now that was interesting."

"You saw through?" asked McGuire eagerly.

"Glimpsed the surface?—an island?"

The scientist's face relaxed. "Don't jump to conclusions," he told the aviator: "we are not ready to

make a geography of Venus quite yet. But we shall know that mark if we ever see it again. I hardly think they had time to get a picture.

"And now there is only a matter of three hours for observation: I must watch every minute. Stay here if you wish. But," he added, "don't let your imagination run wild. Some eruption, perhaps, this we have seen—an ignition of gasses in the upper air—who knows? But don't connect this with your mysterious ship. If the ship is a menace, if it means war, that is your field of action, not mine. And you will be fighting with someone on Earth. It must be that some country has gained a big lead in aeronautics. Now I must get to work."

"I'll not wait," said McGuire. "I will start for the field; get there by daylight, if I can find my way down that road in the dark."

"Thanks a lot." He paused a moment before concluding slowly: "And in spite of what you say, Professor, I believe that we will have something to get together on again in this matter."

The scientist, he saw, had turned again to his instrument. McGuire picked his way carefully along the narrow path that led where he had parked his car. "Good scout, this Sykes!" he was thinking, and he stopped to look overhead in the quick-gathering dark at that laboratory of the heavens, where Sykes and his kind delved and probed, measured and weighed, and gathered painstakingly the messages from suns beyond counting, from universe out there in space that added their bit of enlightenment to the great story of the mystery of creation.

He was humbly aware of his own deep ignorance as he backed his car, slipped it into second, and began the long drive down the tortuous grade. He would have liked to talk more with Sykes. But he had no thought as he wound round the curves how soon that wish was to be gratified.

Part way down the mountainside he again checked his car where he had stopped on the upward climb and reasoned with himself about his errand. Once more he looked out over the level ground below, a vast glowing expanse of electric lights now, that stretched

to the ocean beyond. He was suddenly unthrilled by this man-made illumination, and he got out of his car to stare again at the blackness above and its myriad of stars that gathered and multiplied as he watched.

One brighter than the rest winked suddenly out. There was a constellation of twinkling lights that clustered nearby, and they too vanished. The eyes of the watcher strained themselves to see more clearly a dim-lit outline. There were no lights: it was a black shape, lost in the blackness of the mountain sky, that was blocking out the stars. But it was a shape, and from near the horizon the pale gleams of the rising moon picked it out in softest of outline; a vague ghost of a curve that reflected a silvery contour to the watching eyes below.

There had been a wider space in the road that McGuire had passed; he backed carefully till he could swing his car and turn it to head once more at desperate speed toward the mountain top. And it was less than an hour since he had left when he was racing back along the narrow footpath to slam open the door where Professor Sykes looked up in

amazement at his abrupt return.

The aviator's voice was hoarse with excitement as he shouted: "It's here—the ship! It's here! Where's your phone?—I must call the field! It's right overhead—descending slowly—no lights, but I saw it—I saw it!"

He was working with trembling fingers at the phone where Sykes had pointed. "Long distance!" he shouted. He gave a number to the operator. "Make it quick," he implored. "Quick!"

Chapter 3

Back at Maricopa Flying Field the daily routine had been disturbed. There were conferences of officers, instructions from Colonel Boynton, and a curiosity-provoking lack of explanations. Only with Captain Blake did the colonel indulge in any discussion.

"We'll keep this under our hats," he said, "and out of the newspapers as long as we can. You can imagine what the yellow journals would do with a scarehead like that. Why, they would have us all wiped off the map and the country devastated by imaginary fleets in the first three paragraphs."

Blake regarded his superior gravely. "I feel somewhat the same way, myself. Colonel," he admitted. "When I think what this can mean—some other country so far ahead of us in air force that we are back in the dark ages—well, it doesn't look any too good to me if they mean trouble."

"We will meet it when it comes," said Colonel Boynton. "But, between ourselves, I am in the same

state of mind.

"The whole occurrence is so damn mysterious. Washington hasn't a whisper of information of any such construction; the Secretary admitted that last night. It's a surprise, a complete surprise, to everyone.

"But, Blake, you get that new ship ready as quickly as you can. Prepare for an altitude test the same as we planned, but get into the air the first minute possible. She ought to show a better ceiling than anything we have here, and you may have to fly high to say 'Good morning' to that liner you saw. Put all the mechanics on it that can work to advantage. I think they have it pretty well along now."

"Engine's tested and installed, sir," was Blake's instant report. "I think I can take it up this afternoon."

He left immediately to hurry to the hangar where a new plane stood glistening in pristine freshness, and where hurrying mechanics grumbled under their breaths at the sudden rush for a ship that was

expected to take the air a week later.

An altitude test under full load! Well, what of it? they demanded one of another; wouldn't another day do as well as this one? And they worked as they growled, worked with swift sureness and skill, and the final instruments took their place in the ship that she might roll from the hangar complete under that day's sun.

Her supercharger was tested—the adjunct to a powerful engine that would feed the hungry cylinders with heavy air up in the heights where the air is thin; there were oxygen flasks to keep life in the pilot in the same thin air. And the hot southern sun made ludicrous that afternoon the bulky, heavily-wrapped figure of Captain Blake as he sat at the controls and listened approvingly to the roaring engine.

He waved good-by and smiled understandingly as he met the eyes of Colonel Boynton; then pulled on his helmet, settled himself in his seat and took off in a thunderous blast of sound to begin his long ascent.

He had long since cracked open the valve of his oxygen flask when the climb was ended, and his goggles were frosted in the arctic cold so that it was only with difficulty he could read his instrument board.

"That's the top," he thought in that mind so light and so curiously not his own. He throttled the engine and went into a long spiral that was to end within a rod of where he had started on the brown sun-baked field. The last rays of the sun were slanting over distant mountains as he climbed stiffly from the machine.

"Better than fifty thousand," exulted Colonel Boynton. "Of course your barograph will have to be calibrated and verified, but it looks like a record, Blake—and you had a full load.

"Ready to go up and give merry hell to that other ship if she shows up?" he asked. But Captain Blake shook a dubious head.

"Fifty thousand is just a start for that bird," he said. "You didn't see them shoot out of sight, Colonel. Lord

knows when they quit *their* climb—or where."

"Well, we'll just have a squadron ready in any event," the colonel assured him. "We will make him show his stuff or take a beating—if that is what he wants."

They were in the colonel's office. "You had better go and get warmed up," he told the flyer: "then come back here for instructions." But Blake was more anxious for information than for other comforts.

"I'm all right," he said: "just tired a bit. Let me stretch out here, Colonel, and give me the dope on what you expect of our visitor and what we will do."

He settled back comfortably in a big chair. The office was warm, and Blake knew now he had been doing a day's work.

"We will just take it as it comes," Colonel Boynton explained. "I can't for the life of me figure why the craft was spying around here. What are they looking for? We haven't any big secrets the whole world doesn't know."

"Of course he may not return. But if he does I want you to go up and give him the once over. I can trust you to note every significant detail.

"You saw no wings. If it is a dirigible, let's know something of their power and how they can throw themselves up into the air the way you described. Watch for anything that may serve to identify it and its probable place of manufacture—any peculiarity of marking or design or construction that may give us a lead. Then return and report."

Blake nodded his understanding of what was wanted, but his mind was on further contingencies: he wanted definite instructions.

"And," he asked; "if they attack—what then? Is their fire to be returned?"

"If they make one single false move," said Colonel Boynton savagely, "give them everything you've got. And the 91st Squadron will be off the ground to support you at the first sign of trouble. We don't want to start anything, nor appear to do so. But, by the

gods, Blake, this fellow means trouble eventually as sure as you're a flyer, and we won't wait for him to ask for it twice."

They sat in silence, while the field outside became shrouded in night. And they speculated, as best they could from the few facts they had, as to what this might mean to the world, to their country, to themselves. It was an hour before Blake was aware of the fact that he was hungry.

He rose to leave, but paused while Colonel Boynton answered the phone. The first startled exclamation held him rigid while he tried to piece together the officer's curt responses and guess at what was being told.

"Colonel Boynton speaking.... McGuire?... Yes, Lieutenant.... Over Mount Lawson?... Yes—yes, the same ship, I've no doubt."

His voice was even and cool in contrast to the excited tones that carried faintly to Blake standing by.

"Quite right!" he said shortly. "You will remain where you are: act as observer: hold this line open and keep me informed. Captain Blake will leave immediately for observation. A squadron will follow. Let me know promptly what you see."

He turned abruptly to the waiting man.

"It is back!" he said. "We're in luck! Over the observatories at Mount Lawson; descending, so Lieutenant McGuire says. Take the same ship you had up to-day. Look them over—get up close—good luck!" He turned again to the phone.

There were planes rolling from their hangars before Blake could reach his own ship. Their engines were thundering: men were rushing across the field, pulling on leather helmets and coats as they ran—all this while he warmed up his engine.

A mechanic thrust in a package of sandwiches and a thermos of coffee while he waited. And Captain Blake grinned cheerfully and gulped the last of his food as he waved to the mechanics to pull out the wheel

blocks. He opened the throttle and shot out into the dark.

He climbed and circled the field, saw the waving motion of lights in red and green that marked the take-off of the planes of the 91st, and he straightened out on a course that in less than two hours would bring him over the heights of Mount Lawson and the mystery that awaited him there. And he fingered the trigger grip that was part of the stick and nodded within his dark cockpit at the rattle of a machine gun that merged its staccato notes with the engine's roar.

But he felt, as he thought of that monster shape, as some primordial man might have felt, setting forth with a stone in his hand to wage war on a saurian beast.

Chapter 4

If Colonel Boynton could have stood with one of his lieutenants and Professor Sykes on a mountain top, he would have found, perhaps, the answer to his question. He had wondered in a puzzled fashion why the great ship had shown its mysterious presence over the flying field. He had questioned whether it was indeed the field that had been the object of their attention or whether in the cloudy murk they had merely wandered past. Could he have seen with the eyes of Lieutenant McGuire the descent of the great shape over Mount Lawson, he would have known beyond doubt that here was the magnet that drew the eyes of whatever crew was manning the big craft.

It was dark where the two men stood. Others had come running at their call, but their forms, too, were lost in the shadows of the towering pines. The light from an open door struck across an open space beyond which McGuire and Professor Sykes stood alone, stood silent and spellbound, their heads craned back at a neck-wrenching angle. They were oblivious to all discomforts; their eyes and their whole minds

were on the unbelievable thing in the sky.

Beyond the fact that no lights were showing along the hull, there was no effort at concealment. The moon was up now to illumine the scene, and it showed plainly the gleaming cylinder with its long body and blunt, shining ends, dropping, slowly, inexorably down.

"Like a dirigible," said McGuire huskily. "But the size, man—the size! And its shape is not right; it isn't streamlined correctly; the air—" He stopped his half-unconscious analysis abruptly. "The air!" What had this craft to do with the air? A thin layer of gas that hung close to the earth—the skin on an apple! And beyond—space! There was the ethereal ocean in which this great shape swam!

The reality of the big ship, the very substance of it, made the space ship idea the harder to grasp.

Lieutenant McGuire found that it was easier to see an imaginary craft taking off into space than to conceive of this monstrous shape, many hundreds of tons in weight, being thrown through vast emptiness. Yet he

knew; he knew!

And his mind was a chaos of grim threats and forebodings as he looked at the unbelievable reality and tried to picture what manner of men were watching, peering, from those rows of ports.

At last it was motionless. It hung soundless and silent except for a soft roar, a scant thousand feet in the air. And its huge bulk was dwarfing the giant pines, the rounded buildings; it threw the men's familiar surroundings into a new and smaller scale.

He had many times flown over these mountains, and Lieutenant McGuire had seen the silvery domes of the observatories shining among the trees. Like fortresses for aerial defense, he had thought, and the memory returned to him now. What did these newcomers think of them? Had they, too, found them suggestive of forts on the frontier of a world, defenses against invasion from out there? Or did they know them for what they were? Did they wish only to learn the extent of our knowledge, our culture? Were they friendly, perhaps?—half-timid and fearful of what they

might find?

A star moved in the sky, a pin-point of light that was plain in its message to the aviator. It was Blake, flying high, volplaning to make contact and learn from the air what this stranger might mean. The light of his plane slanted down in an easy descent; the flyer was gliding in on a long aerial toboggan slide. His motor was throttled; there was only the whistle of torn air on the monoplane's wings. McGuire was with the captain in his mind, and like him he was waiting for whatever the stranger might do.

Other lights were clustered where the one plane had been. The men of the 91st had their orders, and the fingers of the watching, silent man gripped an imaginary stick while he wished with his whole heart that he was up in the air. To be with Blake or the others! His thoughts whipped back to the mysterious stranger: the great shape was in motion: it rose sharply a thousand feet in the air.

The approaching plane showed clear in the moon's light. It swung and banked, and the vibrant song of its

engine came down to the men as Blake swept in a great circle about the big ship. He was looking it over, but he began his inspection at a distance, and the orbit of his plane made a tightening spiral as he edged for a closer look. He was still swinging in the monotonous round when the ship made its first forward move.

It leaped in the air: it swept faster and faster. And it was moving with terrific speed as it crashed silently through the path of the tiny plane. And Blake, as he leaned forward on the stick to throw his plane downward in a power dive, could have had a vision, not of a ship of the air, but only of a shining projectile as the great monster shrieked overhead.

McGuire trembled for the safety of those wings as he saw Blake pull his little ship out of the dive and shoot upward to a straight climb.

But—"That's dodging them!" he exulted: "that's flying! I wonder, did they mean to wipe him out or were they only scared off?"

His question was answered as, out of the night, a whistling shriek proclaimed the passage of the meteor ship that drove unmistakably at the lone plane. And again the pilot with superb skill waited until the last moment and threw himself out of the path of the oncoming mass, though his own plane was tossed and whirled like an autumn leaf in the vortex that the enemy created. Not a second was lost as Blake opened his throttle and forced his plane into a steep climb.

"Atta-boy!" said McGuire, as if words could span across to the man in the plane. "Altitude, Blake—get altitude!"

The meteor had turned in a tremendous circle; so swift its motion that it made an actual line of light as the moon marked its course. And the curved line straightened abruptly to a flashing mark that shot straight toward the struggling plane.

This time another sound came down to the listening ears of the two men. The plane tore head on to meet the onslaught, to swing at the last instant in a frantic

leap that ended as before in the maelstrom of air back of the ship. But the muffled roar was changed, punctured with a machine-gun's familiar rattle, and the stabbing flashes from Blake's ship before he threw it out of the other's path were a song of joy to the tense nerves of the men down below.

This deadly rush could only be construed as an attack, and Blake was fighting back. The very speed of the great projectile must hold it to its course; the faster it went the more difficult to swerve it from a line. This and much more was flashing sharply in McGuire's mind. But—Blake!—alone against this huge antagonist!... It was coming back. Another rush like a star through space....

And McGuire shouted aloud in a frenzy of emotion as a cluster of lights came falling from on high. No lone machine gun now that tore the air with this clattering bedlam of shots: the planes of the 91st Squadron were diving from the heights. They came on a steep slant that seemed marking them for crashing death against the huge cylinder flashing past. And their stabbing needles of machine-gun fire made a

drumming tattoo, till the planes, with the swiftness of hawks, swept aside, formed to groups, tore on down toward the ground and then curved in great circles of speed to climb back to the theater of action.

Lieutenant McGuire was rigid and quivering. He should go to the phone and report to the colonel, but the thought left him as quickly as it came. He was frozen in place, and his mind could hold only the scene that was being pictured before him.

The enemy ship had described its swift curve, and the planes of the defenders were climbing desperately for advantage. So slowly they moved as compared with the swiftness of the other!

But the great ship was slowing; it came on, but its wild speed was checked. The light of the full moon showed plainly now what McGuire had seen but dimly before—a great metal beak on the ship, pointed and shining, a ram whose touch must bring annihilation to anything it struck.

The squadron of planes made a group in the sky, and

Blake's monoplane, too, was with them. The huge enemy was approaching slowly: was it damaged? McGuire hardly dared hope ... yet that raking fire might well have been deadly: it might be that some bullets had torn and penetrated to the vitals of this ship's machinery and damaged some part.

It came back slowly, ominously, toward the circling planes. Then, throwing itself through the air, it leaped not directly toward them but off to one side.

Like a stone on the end of a cord it swung with inconceivable speed in a circle that enclosed the group of planes. Again and again it whipped around them, while the planes, by comparison, were motionless. Its orbit was flat with the ground: then tilting, more yet, it made a last circle that stood like a hoop in the air. And behind it as it circled it left a faint trace of vapor. Nebulous!—milky in the moonlight!—but the ship had built a sphere, a great globe of the gas, and within it, like rats in a cage, the planes of the 91st Squadron were darting and whirling.

"Gas!" groaned the watching man: "gas! What is it?"

Why don't they break through?"

The thin clouds of vapor were mingling now and expanding: they blossomed and mushroomed, and the light of the moon came in pale iridescence from their billowing folds.

"Break through!" McGuire had prayed—and he stood in voiceless horror as he saw the attempt.

The mist was touching here and there a plane: they were engulfed, yet he could see them plainly. And he saw with staring, fear-filled eyes the clumsy tumbling and fluttering of unguided wings as the great eagles of the 91st fell roaring to earth with no conscious minds guiding their flight.

The valleys were deep about the mountain, and their shadowed blackness opened to receive the maimed, stricken things that came fluttering or swooping wildly to that last embrace, where, in the concealing shadows, the deeper shadows of death awaited....

There was a room where a telephone waited: McGuire

sensed this but dumbly, and the way to that room was long to his stumbling feet. He was blinded: his mind would not function: he saw only those fluttering things, and the moonlight on their wings, and the shadows that took them so softly at the last.

One plane whistled close overhead. McGuire stopped where he stood to follow it with unbelieving eyes. That one man had lived, escaped the net—it was inconceivable! The plane returned: it was flying low, and it swerved erratically as it flew. It was a monoplane: a new ship.

Its motor was silenced: it stalled as he watched, to pancake and crash where the towering pines made a cradle of great branches to cushion its fall.

No thought now of the colonel waiting impatiently for a report; even the enemy, there in the sky was forgotten. It was Blake in that ship, and he was alive—or had been—for he had cut his motor. McGuire screamed out for Professor Sykes, and there were others, too, who came running at his call. He tore recklessly through the scrub and undergrowth and

gained at last the place where wreckage hung dangling from the trees. The fuselage of a plane, scarred and broken, was still held in the strong limbs.

Captain Blake was in the cockpit, half hanging from the side. He was motionless, quiet, and his face shone white and ghastly as they released him and drew him out. But one hand still clung with a grip like death itself to a hose that led from an oxygen tank. McGuire stared in wonder and slowly gathering comprehension.

"He was fixed for an altitude test," he said dazedly; "this ship was to be used, and he was to find her ceiling. He saw what the others were getting, and he flew himself through on a jet of pure oxygen—" He stopped in utter admiration of the quickness of thought that could outwit death in an instant like that.

They carried the limp body to the light. "No bones broken so far as I can see," said the voice of Professor Sykes. "Leave him here in the air. He must have got a whiff of their devilish mist in spite of his oxygen; he was flying mighty awkwardly when he came in here."

But he was alive!—and Lieutenant McGuire hastened with all speed now to the room where a telephone was ringing wildly and a colonel of the air force must be told of the annihilation of a crack squadron and of a threat that menaced all the world.

In that far room there were others waiting where Colonel Boynton sat with receiver to his ear. A general's uniform was gleaming in the light to make more sober by contrast the civilian clothing of that quiet, clear-eyed man who held the portfolio of the Secretary of War.

They stared silently at Colonel Boynton, and they saw the blood recede from his face, while his cool voice went on unmoved with its replies.

"... I understand," he said; "a washout, complete except for Captain Blake; his oxygen saved him.... It attacked with gas, you say?... And why did not our own planes escape?... Its speed!—yes, we'll have to imagine it, but it is unbelievable. One moment—" He turned to those who waited for his report.

"The squadron," he said with forced quiet, though his lips twitched in a bloodless line, "—the 91st—is destroyed. The enemy put them down with one blow; enveloped them with gas." He recounted the essence of McGuire's report, then turned once more to the phone.

"Hello, Lieutenant—the enemy ship—where is it now?"

He listened—listened—to a silent receiver: silent save for the sound of a shot—a crashing fall—a loud, panting breath. He heard the breathing close to the distant instrument; it ended in a choking gasp; the instrument was silent in his ear....

He signalled violently for the operator: ordered the ringing of any and all phones about the observatory, and listened in vain for a sound or syllable in reply.

"A plane," he told an orderly, "at once! Phone the commercial flying field near the base of Mount Lawson. Have them hold a car ready for me: I shall land there!"

Chapter 5

To Captain Blake alone, of all those persons on the summit of Mount Lawson, it was given to see and to know and be able to relate what transpired there and in the air above. For Blake, although he appeared like one dead, was never unconscious throughout his experience.

Driving head on toward the ship, he had emptied his drum of cartridges before he threw his plane over and down in a dive that escaped the onrush of the great craft by a scant margin, and that carried him down in company with the men and machines of the squadron that dived from above.

He turned as they turned and climbed as they climbed for the advantage that altitude might give. And he climbed faster: his ship outdistanced them in that tearing, scrambling rush for the heights. The squadron was spiraling upward in close formation with his plane above them when the enemy struck.

He saw that great shape swing around them, terrible

in its silent swiftness, and, like the others, he failed to realize at first the net she was weaving. So thin was the gas and so rapid the circling of the enemy craft, they were captured and cut off inside of the gaseous sphere before the purpose of the maneuver was seen or understood.

He saw the first faint vapor form above him; swung over for a steep bank that carried him around the inside of the great cage of gas and that showed him the spiraling planes as the first wisps of vapor swept past them.

He held that bank with his swift machine, while below him a squadron of close-formed fighting craft dissolved before his eyes into unguided units. The formations melted: wings touched and locked; the planes fell dizzily or shot off in wild, ungoverned, swerving flight. The air was misty about him; it was fragrant in his nostrils; the world was swimming....

It was gas, he knew, and with the light-headedness that was upon him, so curiously like that of excessive altitudes, he reached unconsciously for the oxygen

supply. The blast of pure gas in his face revived him for an instant, and in that instant of clear thinking his plan was formed. He threw his weight on stick and rudder, corrected the skid his ship was taking, and, with one hand holding the tube of life-giving oxygen before his face, he drove straight down in a dive toward the earth.

There were great weights fastened to his arm, it seemed, when he tried to bring the ship from her fearful dive. He moved only with greatest effort, and it was force of will alone that compelled his hands to do their work. His brain, as he saw the gleaming roundness of observatory buildings beneath him, was as clear as ever in his life, but his muscles, his arms and legs, refused to work: even his head; he was slowly sinking beneath a load of utter fatigue.

The observatories were behind him; he must swing back; he could not last long, he knew; each slightest movement was intolerable effort.

Was this death? he wondered; but his mind was so clear! There were the buildings, the trees! How

thickly they were massed beyond—

He brought every ounce of will power to bear ... the throttle!—and a slow glide in ... he was losing speed ... the stick—must—come—back! The crashing branches whipped about him, bending, crackling—and the world went dark....

There were stars above him when he awoke, and his back was wrenched and aching. He tried to move, to call, but found that the paralysing effect of the gas still held him fast. He was lying on the ground, he knew: a door was open in a building beyond, and the light in the room showed him men, a small group of them, standing silent while someone—yes, it was McGuire—shouted into a phone.

"... The squadron," he was saying. "... Lost! Every plane down and destroyed.... Blake is living but injured...." And then Blake remembered. And the tumbling, helpless planes came again before his eyes while he cursed silently at this freezing grip that would not let him cover his face with his hands to shut out the sight.

The figure of a man hurried past him, nor saw the body lying helpless in the cool dark. McGuire was still at the phone. And the enemy ship—?

His mind, filled with a welter of words as he tried to find phrases to compass his hate for that ship. And then, as if conjured out of nothing by his thoughts, the great craft itself came in view overhead in all its mighty bulk.

It settled down swiftly: it was riding on an even keel. And in silence and darkness it came from above. Blake tried to call out, but no sound could be formed by his paralyzed throat. Doors opened in silence, swinging down from the belly of the thing to show in the darkness square openings through which shot beams of brilliant yellow light.

There were cages that lowered—great platforms in slings—and the platforms came softly to rest on the ground. They were moving with life; living beings clustered upon them thick in the dark. Oh God! for an instant's release from the numbness that held his lips and throat to cry out one word!... The shapes were

passing now in the shelter of darkness, going toward the room.... He could see McGuire's back turned toward the door.

Man-shapes, tall and thin, distorted humans, each swathed in bulging garments; horrible staring eyes of glass in the masks about their heads, and each hand ready with a shining weapon as they stood waiting for the men within to move.

McGuire must have seen them first, though his figure was half concealed from Blake where he was lying. But he saw the head turn; knew by the quick twist of the shoulders the man was reaching for a gun. One shot echoed in Blake's ears; one bulging figure spun and fell awkwardly to the ground; then the weapons in those clumsy hands hissed savagely while jets of vapor, half liquid and half gas, shot blindingly into the room. The faces dropped from his sight....

There had been the clamor of surprised and shouting men: there was silence now. And the awkward figures in the bloated casings that protected their bodies from the gas passed in safety to the room. Blake,

bound in the invisible chains of enemy gas, struggled silently, futilely, to pit his will against this grip that held him. To lie there helpless, to see these men slaughtered! He saw one of the creatures push the body of his fallen comrade out of the way: it was cast aside with an indifferent foot.

They were coming back: Blake saw the form of McGuire in unmistakable khaki. He and another man were carried high on the shoulders of some of the invaders. They were going toward the platforms, the slings beneath the ship.... They passed close to Blake, and again he was unnoticed in the dark.

A clamor came from distant buildings, a babel of howls and shrieks, inhuman, unearthly. There were no phrases or syllables, but to Blake it was familiar ... somewhere he had heard it ... and then he remembered the radio and the weird wailing note that told of communication. These things were talking in the same discordant din.

They were gathering now on the platforms slung under the ship. A whistling note from somewhere

within the great structure and the platforms went high in the air. They were loaded, he saw, with papers and books and instruments plundered from the observatories. Some made a second trip to take up the loot they had gathered. Then the black doorways closed; the huge bulk of the ship floated high above the trees; it took form, dwindled smaller and smaller, then vanished from sight in the star-studded sky.

Blake thought of their unconscious passenger—the slim figure of Lieutenant McGuire. Mac had been a close friend and a good one; his ready smile; his steady eyes that could tear a problem to pieces with their analytic scrutiny or gaze far into space to see those visions of a dreamer!

"Far into space." Blake repeated the words in his mind. And: "Good-by Mac," he said softly; "you've shipped for a long cruise, I'm thinking." He hardly realized he had spoken the words aloud.

Lying there in the cold night he felt his strength returning slowly. The pines sang their soothing, whispered message, and the faint night noises served

but to intensify the silence of the mountain. It was some time before the grind of straining gears came faintly in the air to announce the coming of a car up the long grade. And still later he heard it come to a stop some distance beyond. There were footsteps, and voices calling: he heard the voice of Colonel Boynton. And he was able to call out in reply, even to move his head and turn it to see the approaching figures in the night.

Colonel Boynton knelt beside him. "Did they get you, old man?" he asked.

"Almost," Blake told him. "My oxygen—I was lucky. But the others—". He did not need to complete the sentence. The silent canyons among those wooded hills told plainly the story of the lost men.

"We will fight them with gas masks," said the colonel; "your experience has taught us the way."

"Gas-tight uniforms and our own supplies of oxygen," Blake supplemented. He told Boynton of the man-things he had seen come from the ship, of their baggy

suits, their helmets.... And he had seen a small generator on the back of each helmet. He told him of the small, shining weapons and their powerful jets of gas. Deadly and unescapable at short range, he well knew.

"They got McGuire," Blake concluded; "carried him off a prisoner. Took another man, too."

For a moment Colonel Boynton's quiet tones lost their even steadiness. "We'll get them," he said savagely, and it was plain that it was the invaders that filled his mind; "we'll go after them, and we'll get them in spite of their damn gas, and we'll rip their big ship into ribbons—"

Captain Blake was able to raise a dissenting hand. "We will have to go where they are, Colonel, to do that."

Colonel Boynton stared at him. "Well?" he demanded. "Why not?"

"We can't go where *they* went," said Blake simply. "I

laughed at McGuire; told him not to be a fool. But I was the fool—the blind one; we all were, Colonel. That thing came here out of space. It has gone back; it is far beyond our air. I saw it go up out of sight, and I know. Those creatures were men, if you like, but no men that we know—not those shrieking, wailing devils! And we're going to hear more from them, now that they've found their way here!"

Chapter 6

A score of bodies where men had died in strangling fumes in the observatories on Mount Lawson; one of the country's leading astronomical scientists vanished utterly; the buildings on the mountain top ransacked; papers and documents blowing in vagrant winds; tales of a monster ship in the air, incredibly huge, unbelievably swift—

There are matters that at times are not allowed to reach the press, but not happenings like these. And the papers of the United States blazed out with headlines to tell the world of this latest mystery.

Then came corroboration from the far corners of the world. The mystery ship had not visited one section only; it had made a survey of the whole civilized sphere, and the tales of those who had seen it were no longer laughed to scorn but went on the wires of the great press agencies to be given to the world. And with that the censorship imposed by the Department of War broke down, and the tragic story of the destruction of the 91st Air Squadron passed into

written history. The wild tale of Captain Blake was on every tongue.

An invasion from space! The idea was difficult to accept. There were scoffers who tried to find something here for their easy wit. Why should we be attacked? What had that other world to gain? There was no answer ready, but the silent lips of the men who had fallen spoke eloquently of the truth. And the world, in wonder and consternation, was forced to believe.

Were there more to come? How meet them? Was this war—and with whom? What neighboring planet could reasonably be suspected. What had science to say?

The scientists! The scientists! The clamor of the world was beating at the doors of science and demanding explanations and answers. And science answered.

A conference was arranged in London; the best minds in the realms of astronomy and physics came together. They were the last to admit the truth that would not be denied, but admit it they must. And to

some of the questions they found their answer.

It was not Mars, they said, though this in the popular mind was the source of the trouble. Not Mars, for that planet was far in the heavens. But Venus!—misnamed for the Goddess of Love. It was Venus, and she alone, who by any stretch of the imagination could be threatening Earth.

What did it mean? They had no answer. The ship was the only answer to that. Would there be more?—could we meet them?—defeat them? And again the wise men of the world refused to hazard a guess.

But they told what they knew; that Venus was past her eastern elongation, was approaching the earth. She of all the planets that swung around the sun came nearest to Earth—twenty-six million miles in another few weeks. Then whirling away she would pass to the western elongation in a month and a half and drive out into space. Venus circled the sun in a year of 225 days, and in 534 days she would again reach her eastern elongation with reference to the earth, and draw near us again.

They were reluctant to express themselves, these men who made nothing of weighing and analyzing stars a million of light years away, but *if* the popular conception was correct and *if* we could pass through the following weeks without further assault, we could count on a year and a half before the menace would again return. And in a year and a half—well, the physicists would be working—and we might be prepared.

Captain Blake had made his report, but this, it seemed, was not enough. He was ordered to come to Washington, and, with Colonel Boynton, he flew across the country to tell again his incredible story.

It was a notable gathering before which he appeared. All the branches of the service were represented; there were men in the uniform of admirals and generals; there were heads of Departments. And the Secretary of War was in charge.

He told his story, did Blake, before a battery of hostile eyes. This was not a gathering to be stampeded by wild scareheads, nor by popular clamor. They wanted

facts, and they wanted them proved. But the gravity with which they regarded the investigation was shown by their invitation to the representatives of foreign powers to attend.

"I have told you all that happened," Blake concluded, "up to the coming of Colonel Boynton. May I reiterate one fact? I do not wonder at your questioning my state of mind and my ability to observe correctly. But I must insist, gentlemen, that while I got a shot of their gas and my muscles and my nervous system were paralyzed, my brain was entirely clear. I saw what I saw; those creatures were there; they entered the buildings; they carried off Lieutenant McGuire and another man.

"What they were or who they were I cannot say. I do not know that they were men, but their insane shrieking in that queer unintelligible talk is significant. And that means of communication corresponds with the radio reception of which you know.

"If you gentlemen know of any part of this earth that

can produce such a people, if you know of any people or country in this world that can produce such a ship—then we can forget all our wild fancies. And we can prepare to submit to that country and that people as the masters of this earth. For I must tell you, gentlemen, with all the earnestness at my command, that until you have seen that ship in action, seen its incredible speed, its maneuverability, its lightning-like attack and its curtain of gas, you can have no conception of our helplessness. And the insignia that she carries is the flag of our conquerors."

Blake got an approving nod from the Secretary of War as he took his seat. That quiet man rose slowly from his chair to add his words. He spoke earnestly, impressively.

"Captain Blake has hit the nail squarely on the head," he stated. "We have here in this room a representative gathering from the whole world. If there is any one of you who can say that this mystery ship was built and manned by your people, let him speak, and we will send you at once a commission to acknowledge your power and negotiate for peace."

The great hall was silent, in a silence that held only uneasy rustlings as men glanced one at another in wondering dismay.

"The time has come," said the Secretary with solemn emphasis, "when all dissensions among our peoples must cease. Whatever there is or ever has been of discord between us fades into insignificance before this new threat. It is the world, now, against a power unknown; we can only face it as a united world.

"I shall recommend to the President of the United States that a commission be appointed, that it may cooperate with similar bodies from all lands. I ask you, gentlemen, to make like representations to your governments, to the end that we may meet this menace as one country and one man; meet it, God grant, successfully through a War Department of the World."

It was a brave gesture of the President of the United States; he dared the scorn and laughter of the world in standing behind his Secretary of War. The world is quick to turn and rend with ridicule a false prophet.

And despite the unanswerable facts, the scope and power of the menace was not entirely believed. It was difficult for the conscious minds of men to conceive of the barriers of vast space as swept aside and the earth laid open to attack.

England was slow to respond to the invitation of the President: this matter required thought and grave deliberation in parliament. It might not be true: the thought, whether spoken or unexpressed, was clinging to their minds. And even if true—even if this lone ship had wandered in from space—there might be no further attack.

"Why," they asked, "should there be more unprovoked assaults from the people of another planet? What was their object? What had they to gain? ... Perhaps we were safe after all." The answer that destroyed all hope came to them borne in upon a wall of water that swept the British coast.

The telescopes of the world were centered now on just one object in the heavens. The bright evening star that adorned the western sky was the target for

instruments great and small. It was past the half-moon phase now, and it became under magnification a gleaming crescent, a crescent that emitted from the dark sphere it embraced vivid flashes of light. Sykes' report had ample corroboration; the flash was seen by many, and it was repeated the next night and the next.

What was it? the waiting world asked. And the answer came not from the telescopes and their far-reaching gaze but from the waters of the Atlantic. In the full blaze of day came a meteor that swept to the earth in an arc of fire to outshine the sun. There must have been those who saw it strike—passengers and crews of passing ships—but its plunge into the depths of the Atlantic spelled death for each witness.

The earth trembled with the explosion that followed. A gas—some new compound that united with water to give volumes tremendous—that only could explain it. The ocean rose from its depths and flung wave after wave to race outward in circles of death.

Hundreds of feet in height at their source—this could

only be estimated—they were devastating when they struck. The ocean raged over the frail bulwark of England in wave upon wave, and, retreating, the waters left smooth, shining rock where cities had been. The stone and steel of their buildings was scattered far over the desolate land or drawn in the suction of retreating waters to the sea.

Ireland, too, and France and Spain. Even the coast of America felt the shock of the explosion and was swept by tidal waves of huge proportions. But the coast of Britain took the blow at its worst.

The world was stunned and waiting—waiting!—when the next blow fell. The flashes were coming from Venus at regular intervals, just twenty hours and nineteen minutes apart. And with exactly the same time intervals the bolts arrived from space to lay waste the earth.

They struck where they would: the ocean again; the Sahara; in the mountains of China; the Pacific was thrown into fearful convulsions; the wheat fields of Canada trembled and vanished before a blast of

flaming gas....

Twenty hours and nineteen minutes! Where it would strike, the next star-shell, no man might say; that it surely would come was a deadly and nerve-shattering certainty. The earth waited and prayed under actual bombardment.

Some super-gun, said science with conviction; a great bore in the planet itself, perhaps. But it was fixed, and the planet itself aimed with an accuracy that was deadly; aimed once as each revolution brought its gun on the target. Herein, said science, lay a basis for hope.

If, in that distant world, there was only one such bore, it must be altering its aim as the planet approached; the gun must cease to bear upon the earth. And the changing sweep of the missiles' flight confirmed their belief.

Each meteor-shell that came rushing into Earth's embrace burned brilliantly as it tore into the air. And each flaming arc was increasingly bent, until—twenty

hours and nineteen minutes had passed—twenty minutes—thirty—another hour ... and the peoples of Earth dropped humbly to their knees in thankful prayer, or raised vengeful eyes and clenched fists toward the heavens while their quivering lips uttered blasphemous curses. The menace, for the time, had passed; the great gun of Venus no longer was aiming toward the earth.

"No more ships," was the belief; "not this time." And the world turned to an accounting of its losses, and to wonder—wonder—what the planet's return would bring. A year and one half was theirs; one year and a half in which to live in safety, in which to plan and build.

A column, double leaded, in the *London Times* voiced the feeling of the world. It was copied and broadcast everywhere.

"Another attack," it concluded, "is not a probability—it is a certainty. They are destroying us for some reason known only to themselves. Who can doubt that when the planet returns there will be a further

bombardment; an invasion by armed forces in giant ships; bombs dropped from them miles high in the air. This is what we must look forward to—death and destruction dealt out by a force we are unable to meet.

"Our munitions factories may build larger guns, but can they reach the heights at which these monster ships of space will lie, with any faint probability of inflicting damage? It is doubtful.

"Our aircraft is less than useless; its very name condemns it as inept. Craft of the air!—and we have to war against space ships which can rise beyond the thin envelope of gas that encircles the earth.

"The world is doomed—utterly and finally doomed; it is the end of humankind; slavery to a conquering race at the very best, unless—

"Let us face the facts fairly. It is war—war to the death—between the inhabitants of this world and of that other. We are men. What they are God alone can say. But they are creatures of mind as are we; what

they have done, we may do.

"There is our only hope. It is vain, perhaps—preposterous in its assumption—but our sole and only hope. We must meet the enemy and defeat him, and we must do it on his own ground. To destroy their fleet we must penetrate space; to silence their deadly bombardment we must go out into space as they have done, reach their distant world as they have reached ours, and conquer as we would have been conquered.

"It is a tenuous hope, but our only one. Let our men of mundane warfare do their best—it will be useless. But if there be one spark of God-given genius in the world that can point the way to victory, let those in authority turn no deaf ear.

"It is a battle now of minds, and the best minds will win. Humanity—all humankind—is facing the end. In less than one year and a half we must succeed—or perish. And unless we conquer finally and decisively, the story of man in the history of the universe will be a tale that is told, a record of life in a book that is ended—closed—and forgotten through all eternity."

Chapter 7

A breath of a lethal gas shot from the flying ship had made Captain Blake as helpless as if every muscle were frozen hard, and he had got it only lightly, mixed with the saving blast of oxygen. His heart had gone on, and his breathing, though it became shallow, did not cease; he was even able to turn his eyes. But to the men in the observatory room the gas from the weapons of the attacking force came as a devastating, choking cloud that struck them senseless as if with a blow. Lieutenant McGuire hardly heard the sound of his own pistol before unconsciousness took him.

It was death for the men who were left—for them the quick darkness never lifted—but for McGuire and his companion there was reprieve.

He was lying flat on a hard floor when remembrance crept slowly back to his benumbed brain. An odor, sickish-sweet, was in his nostrils; the breath of life was being forcibly pumped and withdrawn from laboring lungs; a mask was tight against his face. He struggled to throw it off, and someone bending over

removed it.

Someone! His eyes stared wonderingly at the grotesque face like a lingering phantasm of fevered dreams. There were others, he saw, and they were working over a body not far away upon the floor. He recognized the figure of Professor Sykes. Short, stocky, his clothes disheveled—but Sykes, unmistakably, despite the mask upon his face.

He, too, revived as McGuire watched, and, like the flyer, he looked wonderingly about him at his strange companions. The eyes of the two met and held in wordless communication and astonishment.

The unreal creatures that hovered near withdrew to the far side of the room. The walls beyond them were of metal, white and gleaming; there were doorways. In another wall were portholes—round windows of thick glass that framed circles of absolute night. It was dark out beyond them with a blackness that was relieved only by sharp pin-points of brilliance—stars in a night sky such as McGuire had never seen.

Past and present alike were hazy to the flyer; the spark of life had been brought back to his body from a far distance; there was time needed to part the unreal from the real in these new and strange surroundings.

There were doorways in the ceiling, and others in the floor near where he lay; ladders fastened to the wall gave access to these doors. A grotesque figure appeared above the floor and, after a curious glance at the two men, scrambled into the room and vanished through the opening in the ceiling. It was some time before the significance of this was plain to the wondering man—before he reasoned that he was in the enemy ship, aimed outward from the earth, and the pull of gravitation and the greater force of the vessel's constant acceleration held its occupants to the rear walls of each room. That lanky figure had been making its way forward toward the bow of the ship. McGuire's mind was clearing; he turned his attention now to the curious, waiting creatures, his captors.

There were five of them standing in the room, five shapes like men, yet curiously, strangely, different.

They were tall of stature, narrow across the shoulders, muscular in a lean, attenuated fashion. But their faces! McGuire found his eyes returning in horrified fascination to each hideous, inhuman countenance.

A colorless color, like the dead gray of ashes; a skin like that of an African savage from which all but the last vestige of color had been drained. It was transparent, parchment-like, and even in the light of the room that glowed from some hidden source, he could see the throbbing lines of blood-vessels that showed livid through the translucent skin. And he remembered, now, the fingers, half-seen in his moments of awakening—they were like clinging tendrils, colorless, too, in that ashy gray, and showed the network of veins as if each hand had been flayed alive.

The observer found himself analyzing, comparing, trying to find some earthly analogy for these unearthly creatures. Why did he think of potatoes sprouting in a cellar? What possible connection had these half-human things with that boyhood

recollection? And he had seen some laboratory experiments with plants and animals that had been cut off from the sunlight—and now the connection was clear; he knew what this idea was that was trying to form.

These were creatures of the dark. These bleached, drained faces showed skin that had never known the actinic rays of the sun; their whole framework proclaimed the process that had been going on through countless generations. Here was a race that had lived, if not in absolute darkness, then in some place where sunlight never shone—a place of half-light—or of clouds.

"Clouds!" The exclamation was startled from him. And: "Clouds!" he repeated meditatively; he was seeing again a cloud-wrapped world in the eye-piece of a big refracting telescope. "Blanketed in clouds," Professor Sykes had said. The scientist himself was speaking to him now in bewildered tones.

"Clouds?" he inquired. "That's a strange remark to make. Where are we, Lieutenant McGuire? I

remember nothing after you fired. Are we flying—in the clouds?"

"A long, long way beyond them, is my guess," said McGuire grimly. It was staggering what all this might mean; there was time needed for fuller comprehension. But the lean bronzed face of the flyer flushed with animation, and in spite of the terrors that must surely lie ahead he felt strangely elated at the actuality of an incredible adventure.

Slowly he got to his feet to find that his muscles still were reluctant to respond to orders; he helped the professor to arise. And from the group that drew back further into the far end of the room came a subdued and rasping tumult of discordant sound.

One, seemingly in charge, held a weapon in his hand, a slender tube no thicker than a common wire; and ending in a cylinder within the creature's hand. He pointed it in threatening fashion while his voice rose in a shrill call. McGuire and Professor Sykes stood quiet and waited for what the next moment might have in store, but McGuire waved the weapon aside in

a gesture that none could fail to read.

"Steady," he told his companion. "We're in a ticklish position. Do nothing to alarm them."

From up above them came an answering shrill note. Another of the beings was descending into the room.

"Ah!" said Lieutenant McGuire softly, "the big boss, himself. Now let's see what will happen."

If there had seemed something of timidity in the repulsive faces of the waiting creatures, this newcomer was of a different type. He opened flabby thin lips to give one sharp note of command. It was as sibilant as the hissing of a snake. The man with the weapon returned it to a holder at his side; the whole group cringed before the power and authority of the new arrival.

The men that they had seen thus far were all garbed alike; a loose-fitting garment of one piece that was ludicrously like the play rompers that children might wear. These were dull red in color, the red of drying

blood, made of strong woven cloth. But this other was uniformed differently.

McGuire noted the fineness of the silky robe. Like the others this was made of one piece, loosely fitting, but its bright vivid scarlet made the first seem drab and dull. A belt of metal about his waist shone like gold and matched the emblem of precious metal in the turban on his head.

All this the eyes of the flyer took in at a glance; his attention was only momentarily diverted from the ashen face with eyes narrow and slitted, that stared with the cold hatred of a cat into those of the men.

He made a sound with a whistling breath. It seemed to be a question directed to them, but the import of it was lost.

"An exceedingly queer lot," Professor Sykes observed. "And this chap seems distinctly hostile."

"He's no friend of mine," said McGuire as the thin, pendulous lips repeated their whistling interrogation.

"I can't place them," mused the scientist. "Those facial characteristics.... But they must be of some nationality, speak some tongue."

He addressed himself to the figure with the immobile, horrid face.

"We do not understand you," he said with an ingratiating smile. "*Comprenez vous Francaise?... Non?*"... German, perhaps, or Spanish?... "*Sprechen sie Deutsche? Usted habla Española?...*"

He followed with a fusillade of questions in strange and varying tongues. "I've even tried him with Chinese," he protested in bewilderment and stared amazed at his companion's laughter.

There had to be a reaction from the strain of the past hours, and Lieutenant McGuire found the serious questioning in polyglot tongues and the unchanging feline stare of that hideous face too much for his mental restraint. He held his sides, while he shook and roared with laughter beyond control, and the figure before him glared with evident disapproval of

his mirth.

There was a hissing order, and two figures from the corner sprang forward to seize the flyer with long clinging fingers. Their strength he had overestimated, for a violent throw of his body twisted him free, and his outstretched hands sent the two sprawling across the room. Their leader took one quick step forward, then paused as if hesitating to meet this young adversary.

"Do go easy," Professor Sykes was imploring. "We do not know where we are nor who they are, but we must do nothing to antagonize them."

McGuire had reacted from his hilarious seizure with an emotional swing to the opposite extreme. "I'll break their damn necks," he growled, "if they get rough with me." And his narrow eyes exchanged glare for glare with those in the face like blood and ashes before him.

The cold cat eyes held steadily upon him while the scarlet figure retreated. A louder call, shrill and

vibrant, came from the thin lips, and a swarm of bodies in dull red were scrambling into the room to mass about their scarlet leader. Above and behind them the face under its brilliant turban and golden clasp was glaring in triumph.

The tall figures crouched, grotesque and awkward; their long arms and hands with grasping, tendril-like fingers were ready. McGuire waited for the sharp hissing order that would throw these things upon him, and he met the attack when it came with his own shoulders dropped to the fighter's pose, head drawn in close and both fists swinging free.

There were lean fingers clutching at his throat, a press of blood-red bodies thick about him, and a clustering of faces where color blotched and flowed.

The thud of fists in blows that started from the floor was new to these lean creatures that clawed and clung like cats. But they trampled on those who went down before the flyer's blows and stood upon them to spring at his head; they crowded in in overwhelming numbers while their red hands tore and twined about

his face.

It was no place now for long swings; McGuire twisted his body and threw his weight into quick short jabs at the faces before him. He was clear for an instant and swung his heavy boot at something that clung to one leg; then met with a rain of hooks and short punches the faces that closed in again. He saw in that instant a wild whirl of bodies where the stocky figure of Professor Sykes was smothered beneath his taller antagonists. But the professor, if he was forgetting the science of the laboratory, was remembering that of the squared circle—and the battle was not entirely one sided.

McGuire was free; the blood was trickling down his face from innumerable cuts where sharp-nailed fingers had sunk deep. He wiped the red stream from his eyes and threw himself at the weaving mass of bodies that eddied about Sykes in frantic struggle across the room.

The face of the professor showed clear for a moment. Like McGuire he was bleeding, and his breath came

in short explosive gasps, but he was holding his own! The eyes of McGuire glimpsed a wildly gesticulating, shouting figure in the rear. The face, contorted with rage, was almost the color of the brilliant scarlet that the creature wore. The blood-stained man in khaki left his companion to fight his own battle, and plunged headlong at a leaping cluster of dull red, smashed through with a frenzied attack of straight rights and lefts, and freed himself to make one final leap at the leader of this unholy pack.

He was fighting in blind desperation now; the two were out-numbered by the writhing, lean-bodied creatures, and this thing that showed in blurred crimson before him was the directing power of them all. The figure symbolized and personified to the raging man all the repulsive ugliness of the leaping horde. The face came clear before him through the mist of blood, and he put the last ounce of his remaining strength and every pound of weight behind a straight, clean drive with his right fist.

His last conscious impression was of a red, clawing hand that was closed around the thick butt of a tube

of steel ... then down, and still down, he plunged into a bottomless pit of whirling, red flashes and choking fumes....

There were memories that were to occur to Lieutenant McGuire afterward—visions, dim and hazy and blurred, of half-waking moments when strange creatures forced food and water into his mouth, then held a mask upon his face while he resisted weakly the breathing of sweet, sickly fumes that sent him back to unconsciousness.

There were many such times; some when he came sufficiently awake to know that Sykes was lying near him, receiving similar care. Their lives were being preserved: How, or why, or what life might hold in store he neither knew nor cared; the mask and the deep-drawn fumes brought stupor and numbness to his brain.

A window was in the floor beside him when he awoke—a circular window of thick glass or quartz. But no longer did it frame a picture of a sky in velvet blackness; no unwinking pin-points of distant stars

pricked keenly through the night; but, clear and dazzling, came a blessed radiance that could mean only sunshine. A glowing light that was dazzling to his sleep-filled eyes, it streamed in golden—beautiful—to light the unfamiliar room and show motionless upon the floor the figure of Professor Sykes. His torn clothing had been neatly arranged, and his face showed livid lines of healing cuts and bruises.

McGuire tried gingerly to move his arms and legs; they were still functioning though stiff and weak from disuse. He raised himself slowly and stood swaying on his feet, then made his uncertain way to his companion and shook him weakly by the shoulder.

Professor Sykes breathed deeply and raised leaden lids from tired eyes to stare uncomprehendingly at McGuire. Soon his dark pupils ceased to dilate, and he, too, could see their prison and the light of day.

"Sunlight!" he said in a thin voice, and he seemed to know now that they were in the air; "I wonder—I wonder—if we shall land—what country? ... Some wilderness and a strange race—a strange, strange

race!"

He was muttering half to himself; the mystery of these people whom he could not identify was still troubling him.

McGuire helped the other man to his feet, and they clung to each to the other for support as they crossed to kneel beside the floor-window and learn finally where their captors meant to take them.

A wilderness, indeed, the sight that met their eyes, but a wilderness of clouds—no unfamiliar sight to Lieutenant McGuire of the United States Army air service. But to settle softly into them instead of driving through with glistening wings—this was new and vastly different from anything he had known.

Sounds came to them in the silence, penetrating faintly through thick walls—the same familiar wailing call that trembled and quavered and seemed to the listening men to be guiding them down through the mist.

Gone was the sunlight, and the clouds beyond the deep-set window were gloriously ablaze with a brilliance softly diffused. The cloud bank was deep, and they felt the craft under them sink slowly, steadily into the misty embrace. It thinned below them to drifting vapor, and the first hazy shadows of the ground showed through from far beneath. Their altitude, the flyer knew, was still many thousands of feet.

"Water," said McGuire, as his trained eyes made plain to him what was still indistinct to the scientist. "An ocean—and a shore-line—" More clouds obscured the view; they parted suddenly to show a portion only of a clear-cut map.

It stretched beyond the confines of their window, that unfamiliar line of wave-marked shore; the water was like frozen gold, wrinkled in countless tiny corrugations and reflecting the bright glow from above. But the land,—that drew their eyes!

Were those cities, those shadow-splashed areas of gray and rose?... The last veiling clouds dissolved, and

the whole circle was plain to their view.

The men leaned forward, breathless, intent, till the scientist, Sykes—the man whose eyes had seen and whose brain recorded a dim shape in the lens of a great telescope—Sykes drew back with a quivering, incredulous breath. For below them, so plain, so unmistakable, there lay an island, large even from this height, and it formed on this round map a sharp angle like a great letter "L."

"We shall know that if we ever see it again," Professor Sykes had remarked in the quiet and security of that domed building surmounting the heights of Mount Lawson. But he said nothing now, as he stared at his companion with eyes that implored McGuire to arouse him from this sleep, this dream that could never be real. But McGuire, lieutenant one-time in the forces of the U. S. A., had seen it too, and he stared back with a look that gave dreadful confirmation.

The observatory—Mount Lawson—the earth!—those were the things unreal and far away. And here before them, in brain-stunning actuality, were the markings

unmistakable—the markings of Venus. And they were landing, these two, in the company of creatures wild and strange as the planet—on Venus itself!

Chapter 8

Miles underneath the great ship, from which Lieutenant McGuire and Professor Sykes were now watching through a floor-window of thick glass, was a glittering expanse of water—a great ocean. The flickering gold expanse that reflected back the color of the sunlit clouds passed to one side as the ship took its station above the island, a continent in size, that had shown by its shape like a sharply formed “L” an identifying mark to the astronomer.

They were high in the air; the thick clouds that surrounded this new world were miles from its surface, and the things of the world that awaited were tiny and blurred.

Airships passed and repassed far below. Large, some of them—as bulky as the transport they were on; others were small flashing cylinders, but all went swiftly on their way.

It must have come—some ethereal vibration to warn others from the path—for layer after layer of craft

were cleared for the descent. A brilliant light flashed into view, a dazzling pin-point on the shore below, and the great ship fell suddenly beneath them. Swiftly it dropped down the pathway of light; on even keel it fell down and still down, till McGuire, despite his experience in the air, was sick and giddy.

The light blinked out at their approach. It was some minutes before the watching eyes recovered from the brilliance to see what mysteries might await, and then the surface was close and the range of vision small.

A vast open space—a great court paved with blocks of black and white—a landing field, perhaps, for about it in regular spacing other huge cylinders were moored. Directly beneath in a clear space was a giant cradle of curved arms; it was a mammoth structure, and the men knew at a glance that this was the bed where their great ship would lie.

The smooth pavement seemed slowly rising to meet them as their ship settled close. Now the cradle was below, its arms curved and waiting. The ship entered their grasp, and the arms widened, then closed to

draw the monster to its rest. Their motion ceased. They were finally, beyond the last faint doubt, at anchor on a distant world.

A shrill cackle of sound recalled them from the thrill of this adventure, and the attenuated and lanky figure, with its ashen, blotchy face that glared at them from the doorway, reminded them that this excursion into space was none of their desire. They were prisoners—captives from a foreign land.

A long hand moved its sinuous fingers to motion them to follow, and McGuire regarded his companion with a hopeless look and a despondent shrug of his shoulders.

“No use putting up a fight,” he said; “I guess we’d better be good.”

He followed where the figure was stepping through a doorway into a corridor beyond. They moved, silent and depressed, along the dimly lighted way; the touch of cold metal walls was as chilling to their spirits as to their flesh.

But the mood could not last: the first ray of light from the outside world sent shivers of anticipation along their spines. They were landing, in very fact, upon a new world; their feet were to walk where never man had stood; their eyes would see what mortal eyes had never visioned.

Fears were forgotten, and the men clung to each other not for the human touch but because of an ecstasy of intoxicating, soul-filling joy in the sheer thrill of adventure.

They were gripping each other's hand, round-eyed as a couple of children, as they stepped forward into the light.

Before them was a scene whose blazing beauty of color struck them to frozen silence; their exclamations of wonder died unspoken on their lips. They were in a city of the stars, and to their eyes it seemed as if all the brilliance of the heavens had been gathered for its building.

The spacious, open court itself stood high in the air

among the masses of masonry, and beyond were countless structures. Some towered skyward; others were lower; and all were topped with bulbous towers and graceful minarets that made a forest of gleaming opal light. Opalescence everywhere!—it flashed in red and gold and delicate blues from every wall and cornice and roof.

“Quartz?” marveled Sykes after one long drawn breath. “Quartz or glass?—what are they made of? It is fairyland!”

A jewelled city! Garish, it might have been, and tawdry, in the full light of the sun. But on these weirdly unreal structures the sun’s rays never shone; they were illumined only by the soft golden glow that diffused across this world from the cloud masses far above.

McGuire looked up at that uniform, glowing, golden mass that paled toward the horizon and faded to the gray of banked clouds. His eyes came slowly back to the ramp that led downward to the checkered black and white of the court. Beyond an open portion the

pavement was solidly massed with people.

“People!—we might as well call them that,” McGuire had told Sykes; “they are people of a sort, I suppose. We’ll have to give them credit for brains: they’ve beaten us a hundred years in their inventions.”

He was trying to see everything, understand everything, at once. There was not time to single out the new impressions that were crowding upon him. The air—it was warm to the point of discomfort; it explained the loose, light garments of the people; it came to the two men laden with strange scents and stranger sounds.

McGuire’s eyes held with hungry curiosity upon the dwellers in this other world; he stared at the gaping throng from which came a bedlam of shrill cries. Lean colorless hands gesticulated wildly and pointed with long fingers at the two men.

The din ceased abruptly at a sharp, whistled order

from their captor. He stood aside with a guard that had followed from the ship, and he motioned the two before him down the gangway. It was the same scarlet one who had faced them before, the one whom McGuire had attacked in a frenzy of furious fighting, only to go down to blackness and defeat before the slim cylinder of steel and its hissing gas. And the slanting eyes stared wickedly in cold triumph as he ordered them to go before him in his march of victory.

McGuire passed down toward the masses of color that were the ones who waited. There were many in the dull red of the ship's crew; others in sky-blue, in gold and pink and combinations of brilliance that blended their loose garments to kaleidoscopic hues. But the figures were similar in one unvarying respect: they were repulsive and ghastly, and their faces showed bright blotches of blood vessels and blue markings of veins through their parchment-gray skins.

The crowd parted to a narrow, living lane, and lean fingers clutched writhingly to touch them as they passed between the solid ranks.

McGuire had only a vague impression of a great building beyond, of lower stories decorated in barbaric colors, of towers above in strange forms of the crystal, colorful beauty they had seen. He walked toward it unseeing; his thoughts were only of the creatures round about.

“What damned beasts!” he said. Then, like his companion, he set his teeth to restrain all show of feeling as they made their way through the lane of incredible living things.

They followed their captor through a doorway into an empty room—empty save for one blue-clad individual who stood beside an instrument board let into the wall. Beyond was a long wall, where circular openings yawned huge and black.

The one at the instrument panel received a curt order: the weird voice of the man in red repeated a word that stood out above his curious, wordless tone. “Torg,” he said, and again McGuire heard him repeat the syllable.

The operator touched here and there among his instruments, and tiny lights flashed; he threw a switch, and from one of the black openings like a deep cave came a rushing roar of sound. It dropped to silence as the end of a cylindrical car protruded into the room. A door in the metal car opened, and their guard hustled them roughly inside. The one in red followed while behind him the door clanged shut.

Inside the car was light, a diffused radiance from no apparent source, the whole air was glowing about them. And beneath their feet the car moved slowly but with a constant acceleration that built up to tremendous speed. Then that slackened, and Sykes and McGuire clung to each other for support while the car that had been shot like a projectile came to rest.

“Whew!” breathed the lieutenant; “that was quick delivery.” Sykes made no reply, and McGuire, too, fell silent to study the tremendous room into which they were led. Here, seemingly, was the stage for their next experience.

A vast open hall with a floor of glass that was like obsidian, empty but for carved benches about the walls; there was room here for a mighty concourse of people. The walls, like those they had seen, were decorated crudely in glaring colors, and embellished with grotesque designs that proclaimed loudly the inexperienced touch of the draughtsman. Yet, above them, the ceiling sprang lightly into vaulted, sweeping curves. McGuire's training had held little of architecture, yet even he felt the beauty of line and airy gracefulness of treatment in the structure itself.

The contrast between the flaunting colors and the finished artistry that lay beneath must have struck a discordant note to the scientist. He leaned closer to whisper.

"It is all wrong some way—the whole world! Beauty and refinement—then crude vulgarity, as incongruous as the people themselves—they do not belong here."

"Neither do we," was McGuire's reply; "it looks like a

tough spot that we're in."

He was watching toward a high, arched entrance across the room. A platform before it was raised some six feet above the floor, and on this were seats—ornate chairs, done in sweeping scrolls of scarlet and gold. A massive seat in the center was like the fantastic throne of a child's fairy tale. From the corridor beyond that entrance came a stir and rustling that rivetted the man's attention.

A trumpet peal, vibrant and peculiar, blared forth from the ceiling overhead, and the red figures of the guards stood at rigid attention with lean arms held stiffly before them. The one in scarlet took the same attitude, then dropped his hands to motion the two men to give the same salute.

"You go to hell," said Lieutenant McGuire in his gentlest tones. And the scarlet figure's thin lips were snarling as he turned to whip his arms up to their position. The first of a procession of figures was entering through the arch.

Sykes, the scientist, was paying little attention. “It isn’t true,” he was muttering aloud; “it can’t be true. Venus! Twenty-six million miles at inferior conjunction!”

He seemed lost in silent communion with his own thoughts; then: “But I said there was every probability of life; I pointed out the similarities—”

“Hush!” warned McGuire. The eyes of the scarlet man were sending wicked looks in their direction. Tall forms were advancing through the arch. They, too, were robed in scarlet, and behind them others followed.

The trumpet peal from the dome above held now on a long-drawn, single note, while the scarlet men strode in silence across the dais and parted to form two lines. An inverted “V” that faced the entrance—they were an assembly of rigid, blazing statues whose arms were extended like those on the floor below.

The vibrant tone from on high changed to a crashing blare that shrieked discordantly to send quivering

protest through every nerve of the waiting men. Those about them were shouting, and again the name of Torg was heard, as, in the high arch, another character appeared to play his part in a strange drama.

Thin like his companions, yet even taller than them, he wore the same brilliant robes and, an additional mark of distinction, a head-dress of polished gold. He acknowledged the salute with a quick raising of his own arms, then came swiftly forward and took his place upon the massive throne.

Not till he was seated did the others on the platform relax their rigid pose and seat themselves in the semicircle of chairs. And not till then did they so much as glance at the men waiting there before them—the two Earth-men, standing in silent, impassive contemplation of the brilliant scene and with their arms held quiet at their sides. Then every eye turned full upon the captives, and if McGuire had seen deadly malevolence in the face of their captor he found it a hundred-fold in the inhuman faces that looked down upon them now.

The inquiring mind of Professor Sykes did not fail to note the character of their reception. “But why,” he asked in whispers of his fellow-prisoner, “—why this open hatred of us? What possible animus can they have against the earth or its people?”

The figure on the throne voiced a curt order; the one who had brought them stepped forward. His voice was raised in the same discordant, singing tone that leaped and wandered from note to note. It conveyed ideas—that was apparent; it was a language that he spoke. And the central figure above nodded a brief assent as he finished.

Their captor took an arm of each in his long fingers and pushed them roughly forward to stand alone before the battery of hard eyes.

Now the crowned figure addressed them directly. His voice quavered sharply in what seemed an interrogation. The men looked blankly at each other.

Again the voice questioned them impatiently. Sykes and McGuire were silent. Then the young flyer took

an involuntary step forward and looked squarely at the owner of the harsh voice.

“We don’t know what you are saying,” he began, “and I suppose that our lingo makes no sense to you—” He paused in helpless wonderment as to what he could say. Then—

“But what the devil is it all about?” he demanded explosively. “Why all the dirty looks? You’ve got us here as prisoners—now what do you expect us to do? Whatever it is, you’ll have to quit singing it and talk something we can understand.”

He knew his words were useless, but this reception was getting on his nerves—and his arm still tingled where the scarlet one had gripped him.

It seemed, though, that his meaning was not entirely lost. His words meant nothing to them, but his tone must have carried its own message. There were sharp exclamations from the seated circle. The one who had brought them sprang forward with outstretched, clutching hands; his face was a blood-red blotch.

McGuire was waiting in crouching tenseness that made the red one pause.

“You touch me again,” said the waiting man, “and I’ll knock you into an outside loop.”

The attacker’s indecision was ended by a loud order from above. McGuire turned as if he had been spoken to by the leader on the throne. The thin figure was leaning far forward; his eye were boring into those of the lieutenant, and he held the motionless pose for many minutes. To the angry man, staring back and upward, there came a peculiar optical illusion.

The evil face was vanishing in a shifting cloud that dissolved and reformed, as he watched, into pictures. He knew it was not there, the thing he saw; he knew he was regarding something as intangible as thought; but he got the significance of every detail.

He saw himself and Professor Sykes; they were being crushed like ants beneath a tremendous heel; he knew that the foot that could grind out their lives was that of the one on the throne.

The cloud-stuff melted to new forms that grew clearer to show him the earth. A distorted Earth—and he knew the distortion came from the mind of the being before him who had never seen the earth at first hand; yet he knew it for his own world. It was turning in space; he saw oceans and continents; and before his mental gaze he saw the land swarming with these creatures of Venus. The one before him was in command; he was seated on an enormous throne; there were Earth people like Sykes and himself who crept humbly before him, while fleets of great Venusian ships hovered overhead.

The message was plain—plain as if written in words of fire in the brain of the man. McGuire knew that these creatures intended that the vision should be true—they meant to conquer the earth. The slim, khaki-clad figure of Lieutenant McGuire quivered with the strength of his refusal to accept the truth of what he saw. He shook his head to clear it of these thought wraiths.

“Not—in—a—million—years!” he said, and he put behind his words all the mental force at his command. “Try that, old top, and they’ll give you the fight of your life—” He checked his words as he saw plainly that the thin cruel face that stared and stared was getting nothing from his reply.

“Now what do you think about that?” he demanded of Professor Sykes. “He got an idea across to me—some form of telepathy. I saw his mind, or I saw what he wanted me to see of it. It’s taps, he says, for us, and then they think they’re going across and annex the world.”

He glanced upward again and laughed loudly for the benefit of those who were watching him so closely. “Fine chance!” he said; “a fat chance!” But in the deeper recesses of his mind he was shaken.

For themselves there was no hope. Well, that was all in a lifetime. But the other—the conquest of the earth—he had to try with all his power of will to keep from his mind the pictures of destruction these beastly things could bring about.

The chief of this strange council made a gesture of contempt with the grotesque hands that were so translucent yet ashy-pale against his scarlet robe, and the down-drawn thin lips reflected the thoughts that prompted it. The open opposition of Lieutenant McGuire failed to impress him, it seemed. At a word the one who had brought them sprang forward.

He addressed himself to the circle of men, and he harangued them mightily in harsh discordance. He pointed one lean hand at the two captives, then beat it upon his own chest. "They are mine," he was saying, as the men knew plainly. And they realized as if the weird talk came like words to their ears that this monster was demanding that the captives be given him.

An exchange of dismayed glances, and "Not so good!" said McGuire under his breath; "Simon Legree is asking for his slaves. Mean, ugly devil, that boy!"

The lean figures on the platform were bending

forward, an expression of mirth—distorted, animal smiles—upon their flabby lips. They represented to the humans, so helpless before them, a race of thinking things in whom no last vestige of kindness or decency remained. But was there an exception? One of the circle was standing; the one beside them was sullenly silent as the other on the platform addressed their ruler.

He spoke at some length, not with the fire and vehemence of the one who had claimed them, but more quietly and dispassionately, and his cold eyes, when they rested on those of McGuire and Sykes, seemed more crafty than actively ablaze with malevolent ill-will. Plainly it was the councilor now, addressing his superior. His inhuman voice was silenced by a reply from the one on the throne.

He motioned—this gold-crowned figure of personified evil—toward the two men, and his hand swept on toward the one who had spoken. He intoned a command in harsh gutturals that ended in a sibilant shriek. And the two standing silent and hopeless exchanged looks of despair.

They were being delivered to this other—that much was plain—but that it boded anything but captivity and torment they could not believe. That last phrase was too eloquent of hissing hate.

The creature rose, tall and ungainly, from his throne; amid the salutations of his followers he turned and vanished through the arch. The others of his council followed, all but the one. He motioned to the two men to come with him, and the sullen one who had demanded the men for himself obeyed an order from this councilor who was his superior.

He snapped an order, and four of his men ranged themselves about the captives as a guard. Thin metal cords were whipped about the wrists of each; their hands were tied. The wire cut like a knife-edge if they strained against it.

The new director of their destinies was vanishing through an exit at one side of the great hall; their guard hustled them after. A corridor opened before

them to end in a gold-lit portal; it was daylight out beyond where a street was filled with hurrying figures in many colors. With quavering shrieks they scattered like frightened fowls as an airship descended between the tall buildings that reflected its passing in opalescent hues.

It was a small craft compared with the one that had brought them, and it swept down to settle lightly upon the street with no least regard for those who might be crushed by its descent. Consideration for their fellows did not appear as a marked characteristic of this strange people, McGuire observed thoughtfully. They swarmed in endless droves, these multicolored beings who made of the thoroughfare an ever-changing kaleidoscope—and what was a life or two, more or less, among so many? He found no comfort for themselves in the thought.

Shoulder to shoulder, the two followed where the scarlet figure of the councilor moved toward the waiting ship. Only the professor paid further heed to their surroundings; he marveled aloud at the numbers of the people.

“Hundreds of them,” he said; “thousands! They are swarming everywhere like rats. Horrible!” His eyes passed on to the buildings in their glory of delicate hues, as he added, “And the contrast they make with their surroundings! It is all wrong some way; I wish I knew—”

They were in the ship when McGuire replied. “I hope we live long enough to satisfy your curiosity,” he said grimly.

The ship was rising beneath them; the opal and quartz of the city’s walls were flashing swiftly down.

Chapter 9

They were in a cabin at the very nose of the ship, seated on metal chairs, their hands unshackled and free. Their scarlet guardian reclined at ease somewhat to one side, but despite his apparent disregard his cold eyes seldom left the faces of the two men.

Windows closed them in; windows on each side, in

front, above them, and even in the floor beneath. It was a room for observation whose metal-latticed walls served only as a framework for the glass. And there was much to be observed.

The golden radiance of sunlit clouds was warm above. They rose toward it, until, high over the buildings' tallest spires, there spread on every hand the bewildering beauty of that forest of minarets and sloping roofs and towers, whose many facets made glorious blendings of soft color. Aircraft at many levels swept in uniform directions throughout the sky. The ship they were in hung quiet for a time, then rose to a higher level to join the current of transportation that flowed into the south.

"We will call it south," said Professor Sykes. "The sun-glow, you will observe, is not directly overhead; the sun is sinking; it is past their noon. What is the length of their day? Ah, this interesting—interesting!" The certain fate they had foreseen was forgotten; it is not often given to an astronomer to check at first hand his own indefinite observations.

“Look!” McGuire exclaimed. “Open country! The city is ending!”

Ahead and below them the buildings were smaller and scattered. Their new master was watching with closest scrutiny the excitement of the men; he whispered an order into a nearby tube, and the ship slowly slanted toward the ground. He was studying these new specimens, as McGuire observed, but the lieutenant paid little attention; his eyes were too thoroughly occupied in resolving into recognizable units the picture that flowed past them so quickly. He was accustomed, this pilot of the army air service, to reading clearly the map that spreads beneath a plane, but now he was looking at an unfamiliar chart.

“Fields,” he said, and pointed to squared areas of pale reds and blues; “though what it is, heaven knows. And the trees!—if that’s what they are.” The ship went downward where an area of tropical denseness made a tangled mass of color and shadow.

“Trees!” Lieutenant McGuire had exclaimed, but these forests were of tree-forms in weirdest shapes

and hues. They grew to towering heights, and their branches and leaves that swayed and dipped in the slow-moving air were of delicate pastel shades.

“No sunlight,” said the Professor excitedly; “they have no direct rays of the sun. The clouds act as a screen and filter out actinic rays.”

McGuire did not reply. He was watching the countless dots of color that were people—people who swarmed here as they had in the city; people working at these great groves, crouching lower in the fields as the ship swept close; people everywhere in teeming thousands. And like the vegetation about them, they, too, were tall and thin, attenuated of form and with skin like blood-stained ash.

“They need the sun,” Sykes was repeating; “both vegetable and animal life. The plants are deficient in chlorophyl—see the pale green of the leaves!—and the people need vitamins. Yet they evidently have electric power in abundance. I could tell them of lamps—”

His comments ceased as McGuire lurched heavily against him. The flyer had taken note of the tense, attentive attitude of the one in scarlet; the man was leaning forward, his eyes focused directly upon the scientist's face; he seemed absorbing both words and emotions.

How much could he comprehend? What power had he to vision the idea-pictures in the other's mind? McGuire could not know. But "Sorry!" he told Sykes; "that was clumsy of me." And he added in a whisper, "Keep your thoughts to yourself; I think this bird is getting them."

Buildings flashed under them, not massed solidly as in the city, yet spaced close to one another as if every foot of ground not devoted to their incredible agriculture were needed to house the inhabitants. The ground about them was alive with an equally incredible humanity that swarmed over all this world in appalling profusion.

Their horrid flesh! Their hideous features! And their number! McGuire had a sudden, sickening thought. They were larvae, these crawling hordes—vile worm-things that infested a beautiful world—that bred here in millions, their numbers limited only by the space for their bodies and the food for their stomachs. And he, McGuire, a *man*—he and this other man with his clear-thinking scientific brain were prisoners to this horde; captives, to be used or butchered by those vile, crawling things!

And again it was this world of contrast that drove home the conviction with its sickening certainty. A world of beauty, of delicate colors, of sweeping oceans and gleaming shores and towering cities with their grace and beauty and elfin splendor yet a world that shuddered beneath this devouring plague of grublike men.

They swept past cities and towns and over many miles of open land before their craft swung eastward toward the dark horizon. The master gave another

order into the speaking tube and their ship shot forward, faster and yet faster, with a speed that pressed them heavily into their seats. Behind them was the glory of the sunlit clouds; ahead the gloomy gray-black masses that must make a stygian night sky over this lonely world—a world cut off by that vaporous shell from all communion with the stars.

They were over the water; before them a dark ocean reached out in forbidding emptiness to a darker horizon. Ahead, the only broken line in the vast level expanse was a mountain rising abruptly from the sea. It was a volcanic cone surmounting an island; the sunlight's glow reflected from behind them against the sombre mass that lifted toward the clouds. Their ship was high enough to clear it, but instead it swung, as McGuire watched, toward the south.

The island drifted past, and again they were on their course. But to the flyer there were significant facts that could not pass unobserved. Their own ship had swung in a great circle to avoid this mountain. And all through the skies were others that did the same. The air above and about the grim sentinel peak was

devoid of flying shapes.

McGuire caught the eyes of the councilor, their keeper. "What is that?" he asked, though he knew the words were lost on the other. He nodded his head toward the distant peak, and his question was plainly in regard to the island. And for the first time since their coming to this wild world, he saw, flashing across the features of one of these men, a trace of emotion that could only be construed as fear.

The slitted cat eyes lost their look of complacent superiority. They widened involuntarily, and the face was drained of its blotched color. There was fear, terror unmistakable, though it showed for but an instant. He had control of his features almost at once, but the flyer had read their story.

Here was something that gave pause to this race of conquering vermin; a place in the expanse of this vast sea that brought panic to their hearts. And there came to him, as he stowed the remembrance away in his mind, the first glow of hope. These things could fear a mountain; it might be that they could be

brought to fear a man.

The sky was clearing rapidly of traffic and the mountain of his speculations was lost astern, when another island came slanting swiftly up to meet them as their ship swept down from the heights. It was a tiny speck in the ocean's expanse, a speck that resolved itself into the squared fields of colored growth, orchards whose brilliant, strange fruits glowed crimson in the last light of day, and enormous trees, beyond which appeared a house.

A palace, McGuire concluded, when he saw clearly the many-storied pile. Like the buildings they had seen, this also constructed of opalescent quartz. There were windows that glowed warmly in the dusk. A sudden wave of loneliness, almost unbearable, swept over the man.

Windows and gleaming lights, the good sounds of Earth; home!... And his ears, as he stepped out into the cool air, were assailed with the strange cackle and

calling of weird folk; the air brought him scents, from the open ground beyond, of fruits and vegetation like none he had ever known; and the earth, the homeland of his vain imaginings, was millions of empty miles away....

The leader stopped, and McGuire looked dispiritedly at the unfamiliar landscape under dusky lowering skies. Trees towered high in the air—trees grotesque and weird by all Earth standards—whose limbs were pale green shadows in the last light of day. The foliage, too, seemed bleached and drained of color, but among the leaves were flashes of brilliance where night-blooming flowers burst open like star-shells to fill the air with heavy scents.

Between the men and the forest growth was a row of denser vegetation, great ferns twenty feet and more in height, and among them at regular intervals stood plants of another growth—each a tremendous pod held in air on a thick stalk. Tendrils coiled themselves like giant springs beside each pod, tendrils as thick as a man's wrist. The great pods were ranged in a line that extended as far as McGuire could see in the dim

light.

His shoulders drooped as the guard herded him and his companion toward the building beyond. He must not be cast down—he would not! Who knew how much of such feeling was read by these keen-eyed observers? And the only thought with which he could fill his mind, the one forlorn ghost of a hope that he could cling to, was that of an island, a volcanic peak that rose from dark waters to point upward toward the heights.

The guard of four was clustered about; the figures were waiting now in the gathering dark—waiting, while the one in scarlet listened and spoke alternately into a jeweled instrument that hung by a slender chain about his neck. He raised one lean hand to motion the stirring guards to silence, listened again intently into the instrument, then pointed that hand toward the cloud-filled sky, while he craned his thin neck to look above him.

The men's eyes followed the pointing hand to see only the sullen black of unlit clouds. The last distant

aircraft had vanished from the skies; not a ship was in the air—only the enveloping blanket of high-flung vapor that blocked out all traces of the heavens. And then!—

The cloud banks high in the skies flashed suddenly to dazzling, rolling flame. The ground under their feet was shaken as by a distant earthquake, while, above, the terrible fire spread, a swift, flashing conflagration that ate up the masses of clouds.

“What in thunder—” McGuire began; then stopped as he caught, in the light from above, the reflection of fierce exultation in the eyes of the scarlet one. The evil, gloating message of those eyes needed no words to explain its meaning. That this cataclysm was self-made by these beings, McGuire knew, and he knew that in some way it meant menace to him and his.

Yet he groped in thought for some definite meaning. No menace could this be to himself personally, for he and Sykes stood there safe in the company of the councilor himself. Then the threat of this flaming blast must be directed toward the earth!

The fire vanished, and once more, as Professor Sykes had seen on that night so long ago, the blanket of clouds was broken. McGuire followed the gaze of the scientist whose keen eyes were probing in these brief moments into the depths of star-lit space.

“There—there!” Sykes exclaimed in awe-struck tones. His hand was pointing outward through the space where flames had cleared the sky. A star was shining in the heavens with a glory that surpassed all others. It outshone all neighboring stars, and it sent its light down through the vast empty reaches of space, a silent message to two humans, despondent and heartsick, who stared with aching eyes.

Lieutenant McGuire did not hear his friend’s whispered words. No need to name that distant world—it was Earth! Earth!... And it was calling to its own....

There was a flying-field—so plain before his mental eyes; men in khaki and leather who moved and talked

and spoke of familiar things ... and the thunder of motors ... and roaring planes....

Some far recess within his deeper self responded strangely. What now of threats and these brute-things that threatened?—he was one with this picture he had visioned. He was himself; he was a man of that distant world of men; they would show these vile things how men could meet menace—or death.... His shoulders were back and unconsciously he stood erect.

The scarlet figure was close beside them in the dusk, his voice vibrant with a quality which should have struck fear to his captives' hearts as he ordered them on. But the look in his crafty eyes changed to one of puzzled wonder at sight of the men.

Hands on each other's shoulders, they stood there in the gathering dark, where grotesque trees arched twistingly overhead. Their moment of depression had passed; Earth had called, and they had heard it, each after his own fashion. But to each the call had been one of clear courage. No longer cast off and forlorn, they were one with their own world.

“Down,” said Professor Sykes with a whimsical smile; “down, but not out!” And the lieutenant responded in kind.

“Are we down-hearted?” he demanded loudly. And the two turned as one man to grin at the scarlet one as they thundered. “N-o-o!”

Chapter 10

Two men grinned in derision at the horrible, man-shaped thing that held their destinies in his lean, inhuman hands!—but they turned abruptly away to look again above them where that bright star still shone through an opening in the clouds.

“The earth! Home!” It seemed as if they could never tear their eyes away from the sight.

Their captor whistled an order, and the guard of four tugged vainly at the two, who resisted that they might gaze upon their own world until the closing clouds should blot it from sight. A cry from one of the red guards roused them.

The dark was closing in fast, and their surroundings were dim. Vaguely, McGuire felt more than saw one of the red figures whirled into the air. He sensed a movement in the jungle darkness where were groves of weird trees and the tangle of huge vegetable growths. What it was he could not say, but he felt the guard who clutched at him quiver in terror.

Their leader snatched at the instrument that hung about his neck and put it to his lips; he whistled an order, sharp and shrill. Blazing light that seemed to flame in the air was the response; the air was aglow with an all-pervading brilliance like that in the car that had whirled them from the landing field. The light was everywhere, and the building before them was surrounded by a dazzling envelope of luminosity.

Whatever of motion or menace there had been ceased abruptly. Their guard, three now in number instead of four, seized them roughly and hustled them toward an open door. No time, as they passed, for more than fleeting impressions: a hall of warm, glowing light—a passage that branched off—and, at the end, a room into which they were thrown, while a metal door clanged behind them.

These were no gentle hands that hurled the men staggering through the doorway, and Professor Sykes fell headlong upon the glassy floor. He sprang to his feet, his face aflame with anger. “The miserable beasts!” he shouted.

“Take it easy,” admonished the flyer. “We’re in the hoose-gow; no use of getting all fussed up if they don’t behave like perfect gentlemen.

“There’s a bunk in the corner,” he said, and pointed to a woven hammock that was covered with soft cloths; “and here’s another that I can sling. Twin beds! What more do you want?”

He opened a door and the splash of falling water came to them. A fountain cascaded to the ceiling to fall splashing upon a floor of inlaid, glassy tile. McGuire whistled.

“Room and bath,” he said. “And you complained of the service!”

“I have an idea,” he told the scientist, “that our scarlet friend who owns this place intends to treat us decently, even though his helpers are a bit rough. My hunch is that he wants to get some information out of us. That old bird back there in the council chamber told me as plain as day that they think they are going to conquer the earth. Maybe that’s why we are here—

as exhibits A and B, for them to study and learn how to lick us.”

“You are talking what I would have termed nonsense a month ago,” replied Sykes, “but now—well, I am afraid you are right. And,” he said slowly, “I fear that they are equally correct. They have conquered space; they have ships propelled by some unknown power; they have gas weapons, as you and I have reason to know. And they have all the beastly ferocity to carry such a plan through to success. But I wonder what that sky-splitting blast meant.”

“Bombardment,” the flyer told him; “bombardment of the earth as sure as you’re alive.”

“More nonsense,” said Sykes; “and probably correct.... Well, what are we to do?—sit tight and give them as little information as we can? or—” His question ended unfinished; the alternative, it seemed, was not plain to him.

“There’s only one answer,” said McGuire. “We must get away; escape somehow.”

Professor Sykes' eyes showed his appreciation of a spirit that could still dare to hope, but he asked dejectedly: "Escape? Good idea. But where to?"

"I have an idea," the flyer said slowly. "An idea about an island." He told the professor what he had observed—the fact that there was one spot of land on this globe from which the traffic of these monsters of Venus steered clear. This, he explained, must have some significance.

"Whatever is there, God only knows," he admitted, "but it is something these devils don't like a little bit. It might be interesting to learn more. We'll make a break for it; find a boat. No, we probably can't do it, but we can make a try. Now what is our first step, I wonder."

"Our first step," said Professor Sykes, measuring his words as if he might be working out some astronomical calculation, "is into the inverted shower-bath, if you feel as hot as I do. And our next step, when all is quiet for the night, is through the window I see beyond. I can see the branches of one of those

undernourished trees from here.”

“Last one in is a lop-eared Venusian!” said McGuire, throwing off his jacket. And in that strange room in a strange world, under the shadow of death and of tortures unknown, the two men stripped with all the care-free abandon of a couple of schoolboys racing to be first in the old swimming hole.

It was some time later when the door opened and a long red hand pushed a tray of food into the room. The tray was of unbreakable crystal—he rattled it heedlessly upon the floor—and it held crystal dishes of unknown foods.

They were sampling them all when Sykes remarked plaintively, “I would like to know what under heaven I am eating.”

“I’ve wished to know that in lots of restaurants,” McGuire replied. “I remember a place down on—” He stopped abruptly, then chewed in silence upon a fruit

like a striped pepper that stung his mouth and tongue while he scarcely felt it. References to Earth things plainly were to be avoided: the visions they brought before one's eyes were unnerving.

They made a pretence of sleeping in case they were being observed, and it was some hours later when the two stood quietly beside the open window. As Sykes had seen, there were branches of a pale, twisted tree-growth close outside. McGuire tried his weight upon them, then swung himself out, hand over hand, upon the branch that bent low beneath him. Sykes was close behind when he clambered to the ground to stand for some minutes, listening silently in the dark.

"Too easy!" the lieutenant whispered. "They are too foxy to leave a gateway like that—but here we are. The shore is off in this direction."

The dark of a night unrelieved by a single star was about them as they moved noiselessly away. They followed open ground at first. The building that had been their brief prison was upon their right; beyond and at the left was where the ship landed—it was

gone now—and beyond that the wall of vegetation.

And again, in the dark, McGuire had an uncanny sense of motion. Soft bodies were slipping quietly one upon another; something that lived was there beyond them in the night. No sound or sign of life came from the house; no guard had been posted; and McGuire stopped again, before plunging into the tangled growth, to whisper, “Too easy, Sykes! There’s something about this—”

He had pushed aside the fronds of a giant fern; a cautious step beyond his hands touched a slippery, pliant vine. And his whisper ended as he felt the thing turn and twist beneath his hand. It was alive!—writhing!—cold as the body of a monster snake, and just as vicious and savage in the way that it whipped down and about him in the gloom of the starless night.

The thing was alive! It threw its coils around his body in an embrace that left him breathless; a slender

tendrils were tightening about his neck; his hands and arms were bound.

His ankle was grasped as he was whirled aloft—a human hand that gripped him this time—and Sykes, forgetting discretion and the need for silence, was shouting in the darkness that gave no clue to their opponent. “Hang on!” he yelled. “I’ve got you, Mac!”

His shouts were cut short by another serpent shape that thrashed him and smashed the softer growing things to earth that it might wrap this man, too, in its deadly coils.

McGuire felt his companion’s hold loosen as he was lifted from the ground; there were other arms flailing about him—living, coiling things that seemed to fight one with another for this prize. Abruptly, blindingly, the scene was vividly etched before him: the strange trees, the ferns, the writhing and darting serpent-arms! They were illumined in a dazzling, white light!

He was in the air, clutched strangely in constricting arms; an odor of rotted flesh was in his nostrils,

sickening, suffocating! Beyond and almost beneath him a cauldron of green gaped open, and he saw within it a pool of thick liquid that eddied and steamed to give off the stench of putrescence.

All this in an instant of vision—and in that instant he knew the death they courted. It was a giant pod that held that pool—one of the growths he had seen ranged out like a line of sentinels. But the terrible tendrils that had been coiled and at rest were wrapped about him now, drawing him to that reeking pool of death and the waiting thick lips that would close above him. Sykes, too! The tendrils that had clutched him were whisking his helpless body where another gaping mouth was open—

And then, in the blazing light that was more brilliant than any light of day in this world, the hold about McGuire relaxed. He saw, as he fell, the thick, green lips snap shut; and the arms that had held him pulled back into harmless, tight-wound coils.

Their bodies crashed to earth where a great fern bent beneath them to cushion their fall. And the men lay

silent and gasping for great choking breaths, while from the building beyond came the cackle and shrieking of man-things in manifest enjoyment of the frustrated plans.

It was the laughter that determined McGuire.

“Damn the plants!” he said between hoarse breaths. “Man-eating plants—but they’re—better—than—those devils! And there’s only—one line of them: I saw them here before. Shall we go on?—make a break for it?”

Sykes rolled to the shelter of an arching frond and, without a word, went crawling away. McGuire was behind him, and the two, as they came to open ground, sprang to their feet and ran on through the weird orchard where tree trunks made dim, twisting lines. They ran blindly and helplessly toward the outer dark that promised temporary shelter.

A hopeless attempt: both men, knew the futility of it, while they stumbled onward through the dark. Behind them the night was hideous with noise as the great palace gave forth an eruption of shrieking, inhuman

forms that scattered with whistling and wailing calls in all directions.

A mile or more of groping, hopeless flight, till a yellow gleam shone among the trees to guide them. A building, beyond a clearing, gave a bright illumination to the black night.

“We’ve run in a circle,” choked McGuire, his voice weak and uncertain with exhaustion. “Like a couple of fools!—”

He waited until the heavy breathing that shook his body might be controlled, then corrected himself. “No—this is another—a new one—see the towers! And listen—it’s a radio station!”

The slender frameworks that towered high in air glowed like flame—a warning to the ships whose lights showed now and then far overhead. And, clear and distinct, there came to the listening men the steady, crackling hiss of an uninterrupted signal.

Against the lighted building moving figures showed

momentarily, and McGuire pulled his friend into the safe concealment of a tangle of growth, while the group of yelling things sped past.

“Come on,” he told Sykes; “we can’t get away—not a chance! Let’s have a look at this place, and perhaps—well, I have an idea!” He slipped silently, cautiously on, where a forest of jungle ferns gave promise of safe passage.

Some warning had been sounded; the occupants of the building were scattered to aid in the man-hunt. Only one was left in the room where two Earth-men peeped in at the door.

The figure was seated upon an insulated platform, and his long hands manipulated keys and levers on a table before him. McGuire and Sykes stared amazedly at this broadcasting station whose air was filled with a pandemonium of crashing sound from some distant room, but McGuire was concerned mainly with the motion of a lean, blood-red hand that swung an object like a pointer in free-running sweeps above a dial on the table. And he detected a variation in the din from

beyond as the pointer moved swiftly.

Here was the control board for those messages he had heard; this was the instrument that varied the sending mechanism to produce the wailing wireless cries that made words in some far-distant ears.

McGuire, as he slipped into the room and crept within leaping distance of the grotesque thing so like yet unlike a man, was as silent as the nameless, writhing horror that had seized them in the dark. He sprang, and the two came crashing to the floor.

Lean arms came quickly about him to clutch and tear at his face, but the flyer had an arm free, and one blow ended the battle. The man of Venus relaxed to a huddle of purple and yellow cloth from which a ghastly face protruded. McGuire leaped to his feet and sprang to the place where the other had been.

“Hold them off as long as you can!” he shouted to Sykes, and his hand closed upon the pointer.

Did this station send where he was hoping? Was this the station that had communicated with the ship that

had hovered above their flying field in that far-off land? He did not know, but it was a powerful station, and there was a chance—

He moved the pointer frantically here and there, swung it to one side and another; then found at last a point on the outside of the strange design beneath his hand where the pointer could rest while the crashing crackle of sound was stilled.

And now he swung the pointer—upon the plate—anywhere!—and the noise from beyond told instantly of the current's passage. He held it an instant, then pushed it back to the silent spot—a dash! A quick return that flashed back again to bring silence—a dot! More dashes and dots ... and McGuire thanked a kindly heaven that had permitted him to learn the language of the air, while he cursed his slowness in sending.

Would it reach? Would there be anyone to hear? No certainty; he could only flash the wild Morse symbols out into the night. He must try to get word to them—warn them! And “Blake,” he called, and spelled out

the name of their field, “warning—Venus—”

“Hold them!” he yelled to Sykes at the sound of rushing feet. “Keep them off as long as you can!”

“... Prepare—for invasion. Blake, this is McGuire....” Over and over, he worked the swinging pointer into symbols that might in some way, by some fortunate chance, help that helpless people to resist the horror that lay ahead.

And while heavy bodies crashed against the door that Sykes was holding, there came from some deep-hidden well of memory an inspiration. There was a man he had once met—a man who had confided wondrous things; and now, with the knowledge of these others who had conquered space, he could believe wholly what he had laughed and joked about before. That man, too, had claimed to have travelled far from the earth; he had invented a machine; his name—

The pointer was swinging in frenzied haste to spell over and over the name of a man, and the name, too,

of a forgotten place in the mountains of Nevada. It was repeating the message; then finished in one long crashing wail as a cloud of vapor shot about McGuire and his hand upon the pointer went suddenly limp.

Chapter 11

Captain Blake's game of solitaire had become an obsession. He drove himself to the utmost in the line of duty, and, through the day, the demands of the flying field filled his mind to forgetfulness. And for the rest, he forced his mind to concentrate upon the turn of the cards. He could not read—and he must not think!—so he sat through long evenings trying vainly to forget.

He looked up with an expressionless face as Colonel Boynton entered the room. The colonel saw the cards and nodded.

“Does that help?” he asked, and added without waiting for an answer, “I don't like cards, but I find my mathematics works well.... My old problems—I can concentrate on them, and stop this eternal, damnable thinking, thinking—”

There was something of the same look forming about the eyes of both—that look that told of men who struggled gamely under the sentence of death,

refusing to think or to fear, and waiting, waiting, impotently. Blake looked at the colonel with a carefully emotionless gaze. "It's hell in the big towns, I hear."

The Colonel nodded. "Can't blame them much, if that's what appeals to them. A year and a half!—and they've got to forget it. Why not crowd all the recklessness and excesses they can into the time that is left?—poor devils! But for the most part the world is wagging along, and people are going through the familiar motions."

"Well," said Blake, "I used to wonder at times how a man might feel if he were facing execution. Now we all know. Just going dumbly along, feeling as little as we can, thinking of anything, everything—except the one thing. They've turned to using dope, a lot of them, I hear. Maybe it helps; nobody cares much. Only a year and a half."

He raised his face from which all expression was consciously erased. "Any possible hope?" he asked. "Or do we take it when it comes and fight with what

we've got as long as we can? There was some talk in the papers of an invention—Bureau of Standards cooperating with the big General Committee to investigate. Anything come of it?"

"A thousand of them," said the colonel, "all futile. No, we can't expect much from those things. Though there's a whisper that came to me from Washington. General Clinton—you may remember him; he was here when the thing first broke—says that some scientist, a real one, not another of these half-baked geniuses, has worked out a transformation of some kind. It was too deep for me, but it is based upon changing hydrogen into helium, I think. Liberates some perfectly tremendous amount of power. The general had it all down pat—"

He stopped speaking at the change in Captain Blake's face. The careful repression of all emotions was gone; the face was suddenly alive—

"I know," he said sharply; "I remember something of the theory. There is a difference in the atoms or their protons—the liberation of an electron from each atom

—matter actually transformed into energy; theoretical, what I have read. But—but—Oh my God, Boynton, do you mean that they’ve got it?—that it will drive us through space?”

The colonel drove one fist into the palm of his other hand. “Fool! Idiot!” he exclaimed, and it was evident that the epithets were intended for himself.

“I had forgotten that you had been trained along that line. The general wants a man to work with them, somewhat as a liason officer to link the army requirements closely with their developments; we are hoping to work out a space ship, of course. You are just the man; I will radio him this minute. Be ready to leave—” The slamming of the door marked a hurried exit toward the radio room.

And abruptly, stifflingly, Captain Blake dared to hope. “Scientists will come through with something, some new method of propulsion. All the world is looking to them!” His thoughts were leaping from one possibility to another. “Some miracle of power that will drive a fleet through space as they have done, to battle with

the enemy on his own ground—”

Could he help? Was there one little thing that he could do to apply their knowledge to practical ends? The thought thrilled him with overpowering emotion an hour later as he felt the lift of the plane beneath him.

“Report to General Clinton,” the colonel’s reply had said. “Captain Blake will be assigned to special duty.” He opened the throttle to his ship’s best cruising speed, but his spirit was soaring ahead to urge on the swift scout ship whose wings drove steadily into the gathering dusk.

And then, after long hours, Washington! Brief words with many men—and discouragement! The seat of government of the United States was a city of despondent men, weary, hopeless, but fighting. There was a look of strain on every face; the eyes told a story of sleepless nights and futile thinking and planning. Blake’s elation was short lived.

He was sent to New York and on into the state, where

the laboratories of a great electrical company had turned their equipment from commercial purposes to those of war. Here, surely, one might find fuel to feed the dying embers of hope; the new development must give greater promise than General Clinton had intimated.

“Nothing you can do as yet,” he was told, when he had stated his mission. “It is still experimental, but we have worked out the transformation on a small scale, and harnessed the power.”

Captain Blake was in no mood for temporizing; he was tired with being put off. He stared belligerently at the chief of this department.

“Power—hell!” he said. “We’ve got power now. How will you apply it? How will we use it for travelling through space?”

The great man of science was unmoved by the outburst. “That is poppycock,” he replied; “the unscientific twaddle of the sensational press. We are practical men here; we are working to give you men

who do the fighting better ships and better arms. But you will use them right here on Earth.”

The calm assurance of this man who spoke with a voice of such confidence and authority left the flyer speechless. His brain sent a chaos of profane and violent expletives to the lips that dared not frame them. There was no adequate reply.

Blake jammed his hat upon his head and walked blindly from the room. Heedless of the protests of those he jostled on the street he went raging on, but some subconscious urge directed his steps. He found himself at the railway. There was a station, and a grilled window where he was asking for a ticket back to Washington. And on the following day—

“There is nothing I can do,” he told General Clinton.
“It is hopeless. I ask to be relieved.”

“Why?” The general snapped the question at him. What kind of man was this that Boynton had sent him?

“They are fools,” said Blake bluntly, “pompous, well-meaning fools! They are planning better motors, more power”—he laughed harshly—“and they think that with them we can attack ships that are independent of the air.”

“Still,” asked General Clinton coldly, “for what purpose do you wish to be relieved? What do you intend to do?”

“Return to the field,” said Captain Blake, “to work, and put my planes and personnel in the best possible condition; then, when the time comes, go up and fight like hell.”

An unusual phrasing of a request when one is addressing one’s commander; but the older man threw back his shoulders, that were bending under responsibilities too great for one man to bear, and took a long breath that relaxed his face and seemed to bring relief.

“You’ve got the right idea,”—he spoke slowly and thoughtfully—“the right philosophy. It is all we have

left—to fight like hell when the time comes. Give my regards to Colonel Boynton; he sent me a good man after all.”

Another long flight, westward this time, and, despite the failure of his hopes and of his errand, Blake was flying with a mind at peace. “It is all we have left,” the general had said. Well, it was good to face facts, to admit them—and that was that! There was no use of thinking or worrying.... He lifted the ship to a higher level and glanced at his compass. There were clouds up ahead, and he drove still higher into the night, until he was above them.

And again his peace of mind was not to last.

It was night when he swung the ship over his home port and signalled for a landing. A flood of light swept out across the field to guide him down. He went directly to the colonel’s quarters but found him gone.

“In the radio room, I think,” an orderly told him.

Colonel Boynton was listening intently in the silent

room; he scowled with annoyance at the disturbance of Blake's coming; then, seeing who it was, he motioned quickly for the captain to listen in.

"Good Lord, Blake," he told the captain in an excited whisper; "I'm glad you're here. Another ship had been sighted; she's been all over the earth; just scouting and mapping, probably. And there have been signals the same as before—the same until just now. Listen!—it's talking Morse!—it's been calling for you!"

He thrust a head set into Blake's hands, then reached for some papers. "Poor reception, but there's what we've got," he said.

The paper held the merest fragments of messages that the operator had deciphered. Blake examined them curiously while he listened at the silent receiver.

"Maricopa"—the message, whatever it was, was meant for them, but there were only parts of words and disjointed phrases that the man had written down—"Venus attacking Earth ... Captain Blake ... Sykes and...."

At the name of Sykes, Blake dropped the paper.

“What does this mean?” he demanded. “Sykes!—why Sykes was the astronomer who was captured with McGuire!”

“Listen! Listen!” The colonel’s voice was almost shrill with excitement.

The night was whispering faintly the merest echo of a signal from a station far away, but it resolved itself into broken fragments of sound that were long and short in duration, and the fragments joined to form letters in the Morse code.

“See Winslow,” it told them, and repeated the message: “See Winslow at Sierra....” Some distant storm crashed and rattled for breathless minutes. “Blake see Winslow. This is McGuire, Blake. Winslow can help—”

The message ended abruptly. One long, wailing note; then again the night was voiceless ... and in the radio room at Maricopa Flying Field two men stood

speechless, unbreathing, to stare at each other with incredulous eyes, as might men who had seen a phantom—a ghost that spoke to them and called them by name.

“McGuire—is—alive!” stammered Blake. “They’ve taken him—there!”

Colonel Boynton was considering, weighing all the possibilities, and his voice, when he answered, had the ring of conviction.

“That was no hoax,” he agreed; “that quavering tone could never be faked. That message was sent from the same station we heard before. Yes, McGuire is alive—or was up to the end of that sending.... But, who the devil is Winslow?”

Blake shook his head despairingly. “I don’t know,” he said. “And it seems as if I should—”

It was hours later, far into the night, when he sprang from out of a half-conscious doze to find himself in the middle of the floor with the voice of McGuire ringing

clearly in his ears. A buried memory had returned to the level of his conscious mind. He rushed over to the colonel's quarters.

"I've got it," he shouted to that officer whose head was projecting from an upper window. "I remember! McGuire told me about this Winslow—some hermit that he ran across. He has some invention—some machine—said he had been to the moon. I always thought Mac half believed him. We'll go over Mac's things and find the address."

"Do you think—do you suppose—?" began Colonel Boynton doubtfully.

"I don't dare to think," Blake responded. "God only knows if we dare hope; but Mac—Mac's got a level head; he wouldn't send us unless he knew! Good Lord, man!" he exclaimed, "Mac radioed us from Venus; is there anything impossible after that?"

"Wait there," said Colonel Boynton; "I'll be right down —"

Chapter 12

Lieutenant McGuire awoke, as he had on other occasions, to the smell of sickly-sweet fumes and the stifling pressure of a mask held over his nose and mouth. He struggled to free himself, and the mask was removed. Another of the man-creatures whom McGuire had not seen before helped him to sit up.

A group of the attenuated figures, with their blood-and-ashes faces, regarded him curiously. The one who had helped him arise forced the others to stand back, and he gave McGuire a drink of yellow fluid from a crystal goblet. The dazed man gulped it down to feel a following surge of warmth and life that pulsed through his paralyzed body. The figures before him came sharply from the haze that had enveloped them. A window high above admitted a golden light that meant another day, but it brought no cheer or encouragement to the flyer. McGuire felt crushed and hopeless in the knowledge that his life must still go on.

If only that sleep could have continued—carried him

out to the deeper sleep of death! What hope for them here? Not a chance! And then he remembered Sykes; he mustn't desert Sykes. He looked about him to see the same prison room from which he and Sykes had escaped. The body of the scientist was motionless on the hammock-bed across the room; an occasional deep-drawn breath showed that the man still lived.

No, he must not leave Sykes, even if he had the means of death. They would fight it through together, and perhaps—perhaps—they might yet be of service, might find some way to avert the catastrophe that threatened their world. Hopeless? Beyond doubt. But he must hope—and fight!

The leader had watched the light of understanding as it returned to the flyer's eyes. He motioned now to the others, and McGuire was picked up bodily by four of them and carried from the room.

McGuire's mind was alert once more; he was eager to learn what he could of this place that was to be their prison, but he saw little. A glory of blending colors beyond, where the golden light from without shone

through opal walls—then he found himself upon a narrow table where straps of metal were thrown quickly about to bind him fast. He was tied hand and foot to the table that moved forward on smooth rollers to a waiting lift.

What next? he questioned. Not death, for they had been too careful to keep him alive, these repulsive things that stared at him with such cold malevolence. Then what? And McGuire found himself with unpleasant recollections of others he had seen strapped in similar fashion to an operating table.

The lift that he had thought would rise fell smoothly, instead, to stop at some point far below ground where the table with its helpless burden was rolled into a great room.

He could move his head, and McGuire turned and twisted to look at the maze of instruments that filled the room—a super-laboratory for experiments of which he dared not think.

“Whoever says I’m not scared to death is a liar,” he

whispered to himself, but he continued to look and wonder as he was wheeled before a gleaming machine of many coils and shining, metal parts. A smooth sheet of metal stood vertically beyond him; painted a grayish-white, he saw; but he could not imagine its use. A throng of people, seated in the room, turned blood-red faces toward the bound man and the metal sheet.

“Looks as if we were about to put on a show of some kind,” he told himself, “and I am cast for a leading role.” He watched as best he could from his bound position while a tall figure in robes of lustreless black appeared to stand beside him.

The newcomer regarded him with a face that was devoid of all emotion. McGuire felt the lack of the customary expression of hatred; there was not even that; and he knew he was nothing more than a strange animal, bound, and helpless, ready for this weird creature’s experiments. The one in black held a pencil whose tip was a tiny, brilliant light.

Abruptly the room plunged to darkness, where the

only visible thing was this one point of light. Ceaselessly it waved back and forth before his eyes; he followed it in a pattern of strange design; it approached and receded. Again and again the motion was repeated, until McGuire felt himself sinking—sinking—into a passive state of lethargy. His muscles relaxed; his mind was at rest; there seemed nothing in the entire universe of being but the single point of light that drew him on and on ... till something whispered from the far reaches of black space....

It came to him, an insistent call. It was asking about the earth—his own world. *What of Earth's armies and their means of defense?* Vaguely he sensed the demand, and without conscious volition he responded. He pictured the world he had known; how plainly he saw the wide field at Maricopa, and the sweeping flight of a squadron of planes! *Yes—yes! How high could they ascend?* From one of the planes he saw the world below; the ships were near their ceiling; this was the limit of their climb. *And did they fight with gas? What of their deadlines?* And again he was seated in a plane, and he was firing tiny bullets from a

tiny gun. No. They did not use gas. *But on the ground below—what fortifications? What means of defense?*

McGuire's mind was no longer his own; he could only respond to that invisible questioner, that insistent demand from out of the depths where he was floating. And yet there was something within him that protested, that clamored at his mind and brain.

Fortifications! They must know about fortifications—anti-aircraft guns—means for combatting aerial attack. Yes, he knew, and he must explain—and the thing within him pounded in the back of his brain to draw him back to himself.

He saw a battery of anti-aircraft guns in operation; the guns were firing; shells were bursting in little plumes of smoke high in the air. And that self within him was shouting now, hammering at him; "You are seeing it," it told him; "it is there before you on the screen. Stop! Stop!"

And for an instant McGuire had the strange experience of witnessing his own thoughts. Memories,

mental records of past experience, were flashing through his mind; mock battles, and the batteries were firing! And, before him, on the metal screen, there glowed a vivid picture of the same thing. Men were serving the guns with sure swiftness; the bursts were high in the air—in a flash of understanding Lieutenant McGuire knew that he was giving his country's secrets to the enemy. And in that same instant he felt himself swept upward from the depths of that darkness where he had drifted. He was himself again, bound and helpless before an infernal contrivance of these devil-creatures. They had read his thoughts; the machine beside him had projected them upon the screen for all to see; a steady clicking might mean their reproduction in motion pictures for later study! He, Lieutenant McGuire, was a traitor against his will!

The screen was blank, and the lights of the room came on to show the thin lips that smiled complacently in a cruel and evil face.

McGuire glared back into that face, and he tried with all the mental force that he could concentrate to get

across to the exultant one the fact that they had not wholly conquered him. This much they had got—but no more!

The thin-lipped one had an instrument in his hand, and McGuire felt the prick of a needle plunged into his arm. He tried to move his head and found himself powerless. And now, in the darkness of the room where all lights were again extinguished, the helpless man was fighting the most horrible of battles, and the battleground was within his own mind. He was two selves, and he fought and struggled with all his consciousness to keep those memories from flooding him.

With one part of himself he knew what it meant: a sure knowledge given these invaders of what they must prepare to meet; he was betraying his country; the whole of humanity! And that raging, raving self was powerless to check the flow of memory pictures that went endlessly through his mind and out upon the screen beyond....

He had no sense of time; he was limp and exhausted

with his fruitless struggle when he felt himself released from the bondage of the metal straps and placed again in the hammock in his room. And he could only look wanly and hopelessly after the figure of Professor Sykes, carried by barbarous figures to the same ordeal.

Sleep, through the long night, restored both McGuire and his companion to normal strength. The flyer was seated with his head bowed low in his cupped hands. His words seemed wrung from an agony of spirit. "So that's what they brought us here for," he said harshly; "that's why they're keeping us alive!"

Professor Sykes walked back and forth in their bare room while he shook his impotent fists in the air.

"I told them everything," he exploded; "everything!" Their astronomical knowledge must be limited; under this blanket of clouds they can see nothing, and from their ships they could make approximations only.

"And I have told them—the earth, and its days and seasons—its orbital velocity and motion—its relation

to the orbit of this accursed planet. They had documents from the observatory and I explained them; I corrected their time of firing their big gun on its equatorial position. Oh, there is little I left untold—damn them!”

“I wish to heaven,” said the flyer savagely, “that we had known; we would have jumped out of their beastly ship somehow ten thousand feet up, and we would have taken our information with us.”

Sykes nodded agreement. “Well,” he asked, “how about to-morrow, and the next day, and the next? They will want more facts; they will pump the last drop of information from us. Are we going to allow it?”

McGuire’s tone was dry. “You know the answer to that as well as I do. We have just two alternatives; either we get out of here—find some place to hide in, then find some way to put a crimp in their plans; or we get out of here for good. It’s twenty feet, not twenty thousand, from that window to the ground, but I think a head-first dive would do it.”

Sykes did not reply at once; he seemed to be weighing some problem in his mind.

“I would prefer the water,” he said at last. “If we *can* get away and reach the shore, and if there is not a possibility of escape—which I must admit I consider highly improbable—well, we can always swim out as far as we can go, and the result will be certain.

“This other is so messy.” The man had stopped his ceaseless pacing, and he even managed a cheerful smile at the lieutenant. “And, remember, it might only cripple us and leave us helpless in their hands.”

“Sounds all right to me,” McGuire agreed, and there was a tone of finality in his voice as he added:

“They’ve made us do that traitor act for the last time, anyway.”

Daylight comes slowly through cloud-filled skies; the window of the room where the fountain sprayed ceaselessly was showing the first hint of gold in the eastern sky. Above was the utter darkness of the cloud-wrapped night as the two men swung

noiselessly out into the grotesque branches of a tree to make their way into the gloom below. There, under the cover of great leaves, they crouched in silence, while the darkness about them faded and a sound of subdued whistling noises came to them from the night.

A wheel creaked, and in the dim light two figures appeared tugging at a cart upon which was a cage of woven wire. Beyond them, against the darker background of denser growth, tentacles coiled and twisted above the row of guardian plants that surrounded the house.

One of the ghostly forms reached within the cage and brought forth a struggling object that whimpered in fear. The low whine came distinctly to the hidden men. They saw a vague black thing tossed through the air and toward the deadly plants; they heard the swishing of pliant tentacles and the yelping cry of a frightened animal. And the cry rose to a shriek that ended with the gulping splash of thick liquid.

The giant pod next in line was open—they could see it

dimly—and its tentacles were writhing convulsively, hungrily, across the ground. Another animal was taken from the cage and thrown to the waiting, serpent forms that closed about and whirled it high in air. Another—and another! The yelps of terror grew faint in the distance as the monsters passed on in their gruesome work. And the two men, palpitant with memories of their own experience, were limp and sick with horror.

In the growing light they saw more plainly the fleshy, pliant arms that whipped through the air or felt searchingly along the ground. No hope there for bird or beast that passed by in the night; nor for men, as they knew too well. But now, as the golden light increased, the arms drew back to form again the tight-wound coils that flattened themselves beside the monstrous pods whose lips were closing. Locked within them were the pools of liquid that could dissolve a living body into food for these vampires of the vegetable world.

“Damnable!” breathed Sykes in a savage whisper.
“Utterly damnable! And this world is peopled with

such monsters!”

The last deadly arm was tightly coiled when the men stole off through the lush growth that reached even above their heads. McGuire remembered the outlines he had seen from the air and led the way where, if no better concealment could be found, the ocean waited with promise of rest and release from their inhuman captors.

They counted on an hour's start—it would be that long before their jailer would come with their morning meal and give the alarm—and now they went swiftly and silently through the stillness of a strange world. The air that flicked misty-wet across their faces was heavy and heady with the perfume of night-blooming plants. Crimson blossoms flung wide their odorous petals, and the first golden light was filtered through tremendous tree-growths of pale lavenders and grays to show as unreal colors in the vegetation close about them.

They found no guards; the isolation of this island made the land itself their prison, and the men ran at

full speed through every open space, knowing as they ran that there was no refuge for them—only the ocean waiting at the last. But their flight was not unobserved.

A great bird rose screaming from a tangle of vines; its heavy, flapping wings flashed red against the pale trees. A pandemonium of shrieking cries echoed its alarm as other birds took flight; the forest about them was in an uproar of harsh cries. And faintly, from far in the rear, came a babel of shrill calls—weird, inhuman!—the voices of the men-things of Venus.

“It’s all off,” said McGuire sharply; “they’ll be on our trail now!” He plunged through where the trees were more open, and Sykes was beside him as they ran with a burst of speed toward a hilltop beyond.

They paused, panting, upon the crest. A wide expanse of foliage in delicate shadings swept out before them to wave gently in a sea of color under the morning breeze, and beyond was another sea that beckoned with white breakers on a rocky shore.

“The ocean!” gasped Sykes, and pointed a trembling hand toward their goal. “But—I had no idea—that suicide—was—such hard work!”

The tall figure of Lieutenant McGuire turned to the shorter, breathless man, and he gripped hard at one of his hands.

“Sykes,” he said, “I’ll never get another chance to say it—but you’re one good scout!... Come on!”

McGuire fought to force his way through jungle growth, while screaming birds marked where they went. The sounds of their pursuers were close behind them when the two tore their way through the last snarled tangle of pale vine to stand on a sheer bluff, where, below, deep waters crashed against a rocky wall. They staggered with weariness and gulped sobbingly of the morning air. McGuire could have sworn he was exhausted beyond any further effort, yet from somewhere he summoned energy to spring savagely upon a tall, blood-red figure whose purpling

face rose suddenly to confront them.

One hand closed upon the metal tube that the other hand raised, and, with his final reserve of strength, the flyer wrapped an arm about the tall body and rushed it stumblingly toward the cliff. To be balked now!—to be brought back to that intolerable prison and the unthinkable role of traitor! The khaki-clad figure wrenched furiously at the deadly tube as they struggled and swayed on the edge of the cliff.

He freed his arm quickly, and, regardless of the clawing thing that tore at his face and eyes, he launched one long swing for the horrible face above him. He saw the awkward fall of a lean body, and he swayed helplessly out to follow when the grip of Sykes' hand pulled him back and up to momentary safety.

McGuire's mind held only the desire to kill, and he would have begun a staggering rush toward the shrieking mob that broke from the cover behind them, had not Sykes held him fast. At sight of the weapon, their own gas projector, still clutched in the flyer's

hand, the pursuers halted. Their long arms pointed and their shrill calls joined in a chorus that quavered and fell uncertainly.

One, braver than the rest, dashed forward and discharged his weapon. The spurting gas failed to reach its intended victims; it blew gently back toward the others who fled quickly to either side. Above the trees a giant ship nosed swiftly down, and McGuire pointed to it grimly and in silence. The men before them were massed now for a rush.

“This is the end,” said the flyer softly. “I wonder how this devilish thing works; there’s a trigger here. I will give them a shot with the wind helping, then we’ll jump for it.”

The ship was above them as the slim figure of Lieutenant McGuire threw itself a score of paces toward the waiting group. From the metal tube there shot a stream of pale vapor that swept downward upon the others who ran in panic from its touch.

Then back—and a grip of a hand!—and two Earth-men

who threw themselves out and downward from a sheer rock wall to the cool embrace of deep water.

They came to the top, battered from their fall, but able to dive under a wave and emerge again near one another.

“Swim!” urged Sykes. “Swim out! They may get us here—recover our bodies—resuscitate us. And that wouldn’t do!”

Another wave, and the two men were swimming beyond it; swimming feebly but steadily out from shore, while above them a great cylinder of shining metal swept past in a circling flight. They kept on while their eyes, from the wave tops, saw it turn and come slowly back in a long smooth descent.

It was a hundred feet above the water a short way out at sea, and the two men made feeble motions with arms and legs, while their eyes exchanged glances of dismay.

A door had opened in the round under-surface, and a

figure, whose gas-suit made it a bloated caricature of a man, was lowered from beneath in a sling. From the stern of the ship gaseous vapor belched downward to spread upon the surface of the water. The wind was bringing the misty cloud toward them. “The gas!” said McGuire despairingly. “It will knock us out, and then that devil will get us! They’ll take us back! Our last chance—gone!”

“God help us!” said Sykes weakly. “We can’t—even—die—” His feeble strokes stopped, and he sank beneath the water. McGuire’s last picture as he too sank and the waters closed over his head, was the shining ship hovering beyond.

He wondered only vaguely at the sudden whirling of water around him. A solid something was rising beneath his dragging feet; a firm, solid support that raised him again to the surface. He realized dimly the air about him, the sodden form of Professor Sykes some few feet distant. His numbed brain was trying to comprehend what else the eyes beheld.

A metal surface beneath them rose higher, shining

wet, above the water; a metal tube raised suddenly from its shield, to swing in quick aim upon the enemy ship approaching from above.

His eyes moved to the ship, and to the man-thing below in the sling. Its clothes were a mass of flame, and the figure itself was falling headlong through the air. Above the blazing body was the metal of the ship itself, and it sagged and melted to a liquid fire that poured, splashing and hissing, to the waters beneath. In the wild panic the great shape threw itself into the air; it swept out and up in curving flight to plunge headlong into the depths....

The gas was drifting close, as McGuire saw an opening in the structure beside him. The voice of a man, human, kindly, befriending, said something of "hurry" and "gas," and "lift them carefully but make haste." The white faces of men were blurred and indistinct as McGuire felt himself lowered into a cool room and laid, with the unconscious form of Sykes, upon a floor.

He tried to remember. He had gone down in the water

—Sykes had drowned, and he himself—he was tired—tired. “And this,”—the thought seemed a certainty in his mind—“this is death. How—very—peculiar—” He was trying to twist his lips to a weak laugh as the lighted ports in the wall beside him changed from gold to green, then black—and a rushing of torn waters was in his ears....

Chapter 13

Lieutenant McGuire had tried to die. He and Professor Sykes had welcomed death with open arms, and death had been thwarted by their enemies who wanted them alive—wanted to draw their knowledge from them as a vampire bat might seek to feast. And, when even death was denied them, help had come.

The enemy ship had gone crashing to destruction where its melting metal made hissing clouds of steam as it buried itself in the ocean. And this craft that had saved them—Lieutenant McGuire had never been on a submarine, but he knew it could be only that that held him now and carried him somewhere at tremendous speed.

This was miracle enough! But to see, with eyes which could not be deceiving him, a vision of men, human, white of face—men like himself—bending and working over Sykes' unconscious body—that could not be immediately grasped.

Their faces, unlike the bleached-blood horrors he had

seen, were aglow with the flush of health. They were tall, slenderly built, graceful in their quick motions as they worked to revive the unconscious man. One stopped, as he passed, to lay a cool hand on McGuire's forehead, and the eyes that looked down seemed filled with the blessed quality of kindness.

They were human—his own kind!—and McGuire was unable to take in at first the full wonder of it.

Did the tall man speak? His lips did not move, yet McGuire heard the words as in some inner ear.

“We were awaiting you, friend Mack Guire.” The voice was musical, thrilling, and yet the listening man could not have sworn that he heard a voice at all. It was as if a thought were placed within his mind by the one beside him.

The one who had paused hurried on to aid the others, and McGuire let his gaze wander.

The porthole beside him showed dimly a pale green light; they were submerged, and the hissing rush of

water told him that they were travelling fast. There was a door in the farther wall; beyond was a room of gleaming lights that reflected from myriads of shining levers and dials. A control room. A figure moved as McGuire watched, to press on a lever where a red light was steadily increasing in brightness. He consulted strange instruments before him, touched a metal button here and there, then opened a switch, and the rippling hiss of waters outside their craft softened to a gentler note.

The tall one was beside him again.

“Your friend will live,” he told him in that wordless tongue, “and we are almost arrived. The invisible arms of our anchorage have us now and will draw us safely to rest.”

The kindly tone was music in McGuire’s ears, and he smiled in reply. “Friends!” he thought. “We are among friends.”

“You are most welcome,” the other assured him, “and, yes, you are truly among friends.” But the lieutenant

glanced upward in wonder, for he knew that he had uttered no spoken word.

Their ship turned and changed its course beneath them, then came finally to rest with a slight rocking motion as if cushioned on powerful springs. Sykes was being assisted to his feet as the tall man reached for McGuire's hand and helped him to rise.

The two men of Earth stood for a long minute while they stared unbelievably into each other's eyes. Their wonder and amazement found no words for expression but must have been apparent to the one beside them.

"You will understand," he told them. "Do not question this reality even to yourselves. You are safe!... Come." And he led the way through an opening doorway to a wet deck outside. Beyond this was a wharf of carved stone, and the men followed where steps were inset to allow them to ascend.

Again McGuire could not know if he heard a tumult of sound or sensed it in some deeper way. The air about

them was aglow with soft light, and it echoed in his ears with music unmistakably real—beautiful music!—exhilarating! But the clamor of welcoming voices, like the words from their tall companion, came soundlessly to him.

There were people, throngs of them, waiting. Tall like the others, garbed, like those horrible beings of a past that seemed distant and remote, in loose garments of radiant colors. And everywhere were welcoming smiles and warm and friendly glances.

McGuire let his dazed eyes roam around to find the sculptured walls of a huge room like a tremendous cave. The soft glow of light was everywhere, and it brought out the beauty of flowing lines and delicate colors in statuary and bas-relief that adorned the walls. Behind him the water made a dark pool, and from it projected the upper works of their strange craft.

His eyes were hungry for these new sights, but he turned with Sykes to follow their guide through the colorful crowd that parted to let them through. They

passed under a carved archway and found themselves in another and greater room.

But was it a room? McGuire marveled at its tremendous size. His eyes took in the smooth green of a grassy lawn, the flowers and plants, and then they followed where the hand of Sykes was pointing. The astronomer gripped McGuire's arm in a numbing clutch; his other hand was raised above.

"The stars," he said. "The clouds are gone; it is night!"

And where he pointed was a vault of black velvet. Deep hues of blue seemed blended with it, and far in its depths were the old familiar star-groups of the skies. "Ah!" the scientist breathed, "the beautiful, friendly stars!"

Their guide waited; then, "Come," he urged gently, and led them toward a lake whose unruffled glassy surface mirrored the stars above. Beside it a man was waiting to receive them.

McGuire had to force his eyes away from the unreal beauty of opal walls like the fairy structures they had seen. There was color everywhere that blended and fused to make glorious harmony that was pure joy to the eyes.

The man who waited was young. He stood erect, his face like that of a Grecian statue, and his robe was blazing with the flash of jewels. Beside him was a girl, tall and slender, and sweetly serious of face. Like the man, her garments were lovely with jeweled iridescence, and now McGuire saw that the throng within the vast space was similarly apparelled.

The tall man raised his hand.

“Welcome!” he said, and McGuire realized with a start that the words were spoken aloud. “You are most welcome, my friends, among the people of that world you call Venus.”

Professor Sykes was still weak from his ordeal; he wavered perceptibly where he stood, and the man before them turned to give an order. There were

chairs that came like magic; bright robes covered them; and the men were seated while the man and girl also took seats beside them as those who prepare for an intimate talk with friends.

Lieutenant McGuire found his voice at last. "Who are you?" he asked in wondering tones. "What does it mean? We were lost—and you saved us. But you—you are not like the others." And he repeated, "What does it mean?"

"No," said the other with a slight smile, "we truly are not like those others. They are not men such as you and I. They are something less than human: animals—vermin!—from whom God, in His wisdom, has seen fit to withhold the virtues that raise men higher than the beasts."

His face hardened as he spoke and for a moment the eyes were stern, but he smiled again as he continued.

"And we," he said, "you ask who we are. We are the people of Venus. I am Djorn, ruler, in name, of all. 'In name' I say, for we rule here by common reason; I am

only selected to serve. And this is my sister, Althora. The name, with us, means 'radiant light.'" He turned to exchange smiles with the girl at his side. "We think her well named," he said.

"The others,"—he waved toward the throng that clustered about—"you will learn to know in time."

Professor Sykes felt the need of introductions.

"This is Lieutenant—" he began, but the other interrupted with an upraised hand.

"Mack Guire," he supplied; "and you are Professor Sykes.... Oh, we know you!" he laughed; "we have been watching you since your arrival; we have been waiting to help you."

The professor was open-mouthed.

"Your thoughts," explained the other, "are as a printed page. We have been with you by mental contact at all times. We could hear, but, at that distance, and—pardon me!—with your limited

receptivity, we could not communicate.

“Do not resent our intrusion,” he added; “we listened only for our own good, and we shall show you how to insulate your thoughts. We do not pry.”

Lieutenant McGuire waved all that aside. “You saved us from them,” he said; “that’s the answer. But—what does it mean? Those others are in control; they are attacking our Earth, the world where we lived. Why do you permit—?”

Again the other’s face was set in sterner lines.

“Yes,” he said, and his voice was full of unspoken regret, “they do rule this world; they *have* attacked your Earth; they intend much more, and I fear they must be successful. Listen. Your wonderment is natural, and I shall explain.

“We are the people of Venus. Some centuries ago we ruled this world. Now you find us a handful only, living like moles in this underworld.”

“Underworld?” protested Professor Sykes. He pointed above to the familiar constellations. “Where are the clouds?” he asked.

The girl, Althora, leaned forward now. “It will please my brother,” she said in a soft voice, “that you thought it real. He has had pleasure in creating that—a replica of the skies we used to know before the coming of the clouds.”

Professor Sykes was bewildered. “That sky—the stars—they are not real?” he asked incredulously. “But the grass—the flowers—”

Her laugh rippled like music. “Oh, they are real,” she told him, and her brother gave added explanation.

“The lights,” he said: “we supply the actinic rays that the clouds cut off above. We have sunlight here, made by our own hands; that is why we are as we are and not like the red ones with their bleached skins. We had our lights everywhere through the world when we lived above, but those red beasts are ignorant; they do not know how to operate them; they do not

know that they live in darkness even in the light.”

“Then we are below ground?” asked the flyer. “You live here?”

“It is all we have now. At that time of which I tell, it was the red ones who lived out of sight; they were a race of rodents in human form. They lived in the subterranean caves with which this planet is pierced. We could have exterminated them at any time, but, in our ignorance, we permitted them to live, for we, of Venus—I use your name for the planet—do not willingly take life.”

“They have no such compunctions!” Professor Sykes’ voice was harsh; he was remembering the sacrifice to the hungry plants.

A flash as of pain crossed the sensitive features of the girl, and the man beside her seemed speaking to her in soundless words.

“Your mind-picture was not pleasant,” he told the scientist; then continued:

“Remember, we were upon the world, and these others were within it. There came a comet. Oh, our astronomers plotted its course; they told us we were safe. But at the last some unknown influence diverted it; its gaseous projection swept our world with flame. Only an instant; but when it had passed there was left only death....”

He was lost in recollection for a time; the girl beside him reached over to touch his hand.

“Those within—the red ones—escaped,” he went on. “They poured forth when they found that catastrophe had overwhelmed us. And we, the handful that were left, were forced to take shelter here. We have lived here since, waiting for the day when the Master of Destinies shall give us freedom and a world in which to live.”

“You speak,” suggested the scientist, “as if this had happened to you. Surely you refer to your ancestors; you are the descendants of those who were saved.”

“We are the people,” said the other. “We lived then;

we live now; we shall live for a future of endless years.

“Have you not searched for the means to control the life principle—you people of Earth?” he asked. “We have it here. You see”—and he waved a hand toward the standing throng—“we are young to your eyes and the others who greeted you were the same.”

McGuire and the scientist exchanged glances of corroboration.

“But your age,” asked Sykes, “measured in years?”

“We hardly measure life in years.”

Professor Sykes nodded slowly; his mind found difficulty in accepting so astounding a fact. “But our language?” he queried. “How is it that you can speak our tongue?”

The tall man smiled and leaned forward to place a hand on a knee of each of the men beside him. “Why not,” he asked, “when there doubtless is relationship

between us.

“You called the continent Atlantis. Perhaps its very existence is but a fable now: it has been many centuries since we have had instruments to record thought force from Earth, and we have lost touch. But, my friends, even then we of Venus had conquered space, and it was we who visited Atlantis to find a race more nearly like ourselves than were the barbarians who held the other parts of Earth.

“I was there, but I returned. There were some who stayed and they were lost with the others in the terrible cataclysm that sank a whole continent beneath the waters. But some, we have believed, escaped.”

“Why have you not been back?” the flyer asked. “You could have helped us so much.”

“It was then that our own destruction came upon us. The same comet, perhaps, may have caused a change of stresses in your Earth and sunk the lost Atlantis. Ah! That was a beautiful land, but we have never seen

it since. We have been—here.

“But you will understand, now,” he added, “that, with our insight into your minds, we have little difficulty in mastering your language.”

This talk of science and incredible history left Lieutenant McGuire cold. His mind could not wander long from its greatest concern.

“But the earth!” he exclaimed. “What about the earth? This attack! Those devils mean real mischief!”

“More than you know; more than you can realize, friend Mack Guire!”

“Why?” demanded the flyer. “Why?”

“Have your countries not reached out for other countries when land was needed?” asked the man, Djorn. “Land—land! Space in which to breed—that is the reason for the invasion.

“This world has no such continents as yours. Here the

globe is covered by the oceans; we have perhaps one hundredth of the land areas of your Earth And the red ones breed like flies. Life means nothing to them; they die like flies, too. But they need more room; they intend to find it on your world.”

“A strange race,” mused Professor Sykes. “They puzzled me. But—‘less than human,’ I think you said. Then how about their ships? How could they invent them?”

“Ours—all ours! They found a world ready and waiting for them. Through the centuries they have learned to master some few of our inventions. The ships!—the ethereal vibrations! Oh, they have been cleverer than we dreamed possible.”

“Well, how can we stop them?” demanded McGuire. “We must. You have the submarines—”

“One only,” the other interrupted. “We saved that, and we brought some machinery. We have made this place habitable; we have not been idle. But there are limitations.”

“But your ray that you projected—it brought down their ship!”

“We were protecting you, and we protect ourselves; that is enough. There is One will deliver us in His own good time; we may not go forth and slaughter.”

There was a note of resignation and patience in the voice that filled McGuire with hopeless forebodings. Plainly this was not an aggressive race. They had evolved beyond the stage of wanton slaughter, and, even now, they waited patiently for the day when some greater force should come to their aid.

The man beside them spoke quickly. “One moment—you will pardon me—someone is calling—” He listened intently to some soundless call, and he sent a silent message in reply.

“I have instructed them,” he said. “Come and you shall see how impregnable is our position. The red ones have resented our destruction of their ship.”

The face of the girl, Althora, was perturbed. “More

killings?" she asked.

"Only as they force themselves to their own death," her brother told her. "Be not disturbed."

The throng in the vast space drew apart as the figure of their leader strode quickly through with the two men following close. There were many rooms and passages; the men had glimpses of living quarters, of places where machinery made soft whirring sounds; more sights than their eyes could see or their minds comprehend. They came at last to an open chamber.

The men looked up to see above them a tremendous inverted-cone, and there was the gold of cloudland glowing through an opening at the top. It was the inside of a volcano where they stood, and McGuire remembered the island and its volcanic peak where the ship had swerved aside. He felt that he knew now where they were.

Above them, a flash of light marked the passage of a ship over the crater's mouth, and he realized that the ships of the reds were not avoiding the island now.

Did it mean an attack? And how could these new friends meet it?

Before them on the level volcanic floor were great machines that came suddenly to life, and their roar rose to a thunder of violence, while, in the center, a cluster of electric sparks like whirling stars formed a cloud of blue fire. It grew, and its hissing, crackling length reached upward to a fine-drawn point that touched the opening above.

“Follow!” commanded their leader and went rapidly before them where a passage wound and twisted to bring them at last to the light of day.

The flame of the golden clouds was above them in the midday sky, and beneath it were scores of ships that swept in formations through the air.

“Attacking?” asked the lieutenant with ill-concealed excitement.

“I fear so. They tried to gas us some centuries ago; it may be they have forgotten what we taught them

then.”

One squadron came downward and swept with inconceivable speed over a portion of the island that stretched below. The men were a short distance up on the mountain’s side, and the scene that lay before them was crystal clear. There were billowing clouds of gas that spread over the land where the ships had passed. Other ships followed; they would blanket the island in gas.

The man beside them gave a sigh of regret. “They have struck the first blow,” he said. He stood silent with half-closed eyes; then: “I have ordered resistance.” And there was genuine sorrow and regret in his eyes as he looked toward the mountain top.

McGuire’s eyes followed the other’s gaze to find nothing at first save the volcanic peak in hard outline upon the background of gold; then only a shimmer as of heat about the lofty cone. The air above him quivered, formed to ripples that spread in great circles where the enemy ships were flashing away.

Swifter than swift aircraft, with a speed that shattered space, they reached out and touched—and the ships, at that touch, fell helplessly down from the heights. They turned awkwardly as they fell or dropped like huge pointed projectiles. And the waters below took them silently and buried in their depths all trace of what an instant sooner had been an argosy of the air.

The ripples ceased, again the air was clear and untroubled, but beneath the golden clouds was no single sign of life.

The flyer's breathless suspense ended in an explosive gasp. "What a washout!" he exclaimed, and again he thought only of this as a weapon to be used for his own ends. "Can we use that on their fleets?" he asked. "Why, man—they will never conquer the earth; they will never even make a start."

The tall figure of Djorn turned and looked at him. "The lust to kill!" he said sadly. "You still have it—though you are fighting for your own, which is some excuse.

“No, this will not destroy their fleets, for their fleets will not come here to be destroyed. It will be many centuries before ever again the aircraft of the reds dare venture near.”

“We will build another one and take it where they are —” The voice of the fighting man was vibrant with sudden hope.

“We were two hundred years building and perfecting this,” the other told him. “Can you wait that long?”

And Lieutenant McGuire, as he followed dejectedly behind the leader, heard nothing of Professor Sykes’ eager questions as to how this miracle was done.

“Can you wait that long?” this man, Djorn, had asked. And the flyer saw plainly the answer that spelled death and destruction to the world.

Chapter 14

The mountains of Nevada are not noted for their safe and easy landing places. But the motor of the plane that Captain Blake was piloting roared smoothly in the cool air while the man's eyes went searching, searching, for something, and he hardly knew what that something might be.

He went over again, as he had done a score of times, the remarks of Lieutenant McGuire. Mac had laughed that day when he told Blake of his experience.

"I was flying that transport," he had said, "and, boy! when one motor began to throw oil I knew I was out of luck. Nothing but rocky peaks and valleys full of trees as thick and as pointed as a porcupine's quills. Flying pretty high to maintain altitude with one motor out, so I just naturally *had* to find a place to set her down. I found it, too, though it seemed too good to be true off in that wilderness.

"A fine level spot, all smooth rock, except for a few clumps of grass, and just bumpy enough to make the

landing interesting. But, say, Captain! I almost cracked up at that, I was so darn busy staring at something else.

“Off in some trees was a dirigible—Sure; go ahead and laugh; I didn’t believe it either, and I was looking at it. But there had been a whale of a storm through there the day before, and it had knocked over some trees that had been screening the thing, and there it was!

“Well, I came to in time to pull up her nose and miss a rock or two, and then I started pronto for that valley of trees and the thing that was buried among them.”

Captain Blake recalled the conversation word for word, though he had treated it jokingly at the time. McGuire had found the ship and a man—a half-crazed nut, so it seemed—living there all alone. And he wasn’t a bit keen about Mac’s learning of the ship. But leave it to Mac to get the facts—or what the old bird claimed were facts.

There was the body of a youngster there, a man of

about Mac's age. He had fallen and been killed the day before, and the old man was half crazy with grief. Mac had dug a grave and helped bury the body, and after that the old fellow's story had come out.

He had been to the moon, he said. And this was a space ship. Wouldn't tell how it operated, and shut up like a clam when Mac asked if he had gone alone. The young chap had gone with him, it seemed, and the man wouldn't talk—just sat and stared out at the yellow mound where the youngster was buried.

Mac had told Blake how he argued with the man to prove up on his claims and make a fortune for himself. But no—fortunes didn't interest him. And there were some this-and-that and be-damned-to-'em people who would never get *this* invention—the dirty, thieving rats!

And Mac, while he laughed, had seemed half to believe it. Said the old cuss was so sincere, and he had nothing to sell. And—there was the ship! It never got there without being flown in, that was a cinch. And there wasn't a propellor on it nor a place for one

—just open ports where a blast came out, or so the inventor said.

Captain Blake swung his ship on another slanting line and continued to comb the country for such marks as McGuire had seen. And one moment he told himself he was a fool to be on any such hunt, while the next thought would remind him that Mac had believed. And Mac had a level head, and he had radioed from Venus!

There was the thing that made anything seem possible. Mac had got a message through, across that space, and the enemy had ships that could do it. Why not this one?

And always his eyes were searching, searching, for a level rocky expanse and a tree-filled valley beyond, with something, it might be, shining there, unless the inventor had camouflaged it more carefully now.

It was later on the same day when Captain Blake's blocky figure climbed over the side of the cockpit. Tired? Yes! But who could think of cramped limbs and

weary muscles when his plane was resting on a broad, level expanse of rock in the high Sierras and a sharp-cut valley showed thick with pines beyond. He could see the corner only of a rough log shack that protruded.

Blake scrambled over a natural rampart of broken stone and went swiftly toward the cabin. But he stopped abruptly at the sound of a harsh voice.

“Stop where you are,” the voice ordered, “and stick up your hands! Then turn around and get back as fast as you can to that plane of yours.” There was a glint of sunlight on a rifle barrel in the window of the cabin.

Captain Blake stopped, but he did not turn. “Are you Mr. Winslow?” he asked.

“That’s nothing to you! Get out! Quick!”

Blake was thinking fast. Here was the man, without doubt—and he was hostile as an Apache; the man behind that harsh voice meant business. How could

he reach him? The inspiration came at once. McGuire was the key.

“If you’re Winslow,” he called in a steady voice, “you don’t want me to go away; you want to talk with me. There’s a young friend of yours in a bad jam. You are the only one who can help.”

“I haven’t any friends,” said the rasping voice: “I don’t want any! Get out!”

“You had one,” said the captain, “whether you wanted him or not. He believed in you—like the other young chap who went with you to the moon.”

There was an audible gasp of dismay from the window beyond, and the barrel of the rifle made trembling flickerings in the sun.

“You mean the flyer?” asked the voice, and it seemed to have lost its harsher note. “The pleasant young fellow?”

“I mean McGuire, who helped give decent burial to

your friend. And now he has been carried off—out into space—and you can help him. If you’ve a spark of decency in you, you will hear what I have to say.”

The rifle vanished within the cabin; a door opened to frame a picture of a tall man. He was stooped; the years, or solitude, perhaps, had borne heavily upon him; his face was a mat of gray beard that was a continuation of the unkempt hair above. The rifle was still in his hand.

But he motioned to the waiting man, and “Come in!” he commanded. “I’ll soon know if you’re telling the truth. God help you if you’re not.... Come in.”

An hour was needed while the bearded man learned the truth. And Blake, too, picked up some facts. He learned to his great surprise that he was talking with an educated man, one who had spent a lifetime in scientific pursuits. And now, as the figure before him seemed more the scientist and less the crazed fabricator of wild fancies, the truth of his claims seemed not so remote.

Half demented now, beyond a doubt! A lifetime of disappointments and one invention after another stolen from him by those who knew more of law than of science. And now he held fortune in the secret of his ship—a secret which he swore should never be given to the world.

“Damn the world!” he snarled. “Did the world ever give anything to me? And what would they do with this? They would prostitute it to their own selfish ends; it would be just one more means to conquer and kill; and the capitalists would have it in their own dirty hands so that new lines of transportation beyond anything they dared dream would be theirs to exploit.”

Blake, remembering the history of a commercial age, found no ready reply to that. But he told the man of McGuire and the things that had made him captive; he related what he, himself, had seen in the dark night on Mount Lawson, and he told of the fragmentary message that showed McGuire was still alive.

“There’s only one way to save him,” he urged. “If your ship is what you claim it is—and I believe you one hundred per cent—it is all that can save him from what will undoubtedly be a horrible death. Those things were monsters—inhuman!—and they have bombarded the earth. They will come back in less than a year and a half to destroy us.”

Captain Blake would have said he was no debater, but the argument and persuasion that he used that night would have done credit to a Socrates. His opponent was difficult to convince, and not till the next day did the inventor show Blake his ship.

“Small,” he said as he led the flyer toward it.

“Designed just for the moon trip, and I had meant to go alone. But it served; it took us there and back again.”

He threw open a door in the side of the metal cylinder. Blake stood back for only a moment to size up the machine, to observe its smooth duralumin shell and the rounded ends where portholes opened for the expelling of its driving blast. The door opening

showed a thick wall that gave insulation. Blake followed the inventor to the interior of the ship.

The man had seen Winslow examining the thick walls. “It’s cold out there, you know,” he said, and smiled in recollection, “but the generator kept us warm.” He pointed to a simple cylindrical casting aft of the ship’s center part. It was massive, and braced to the framework of the ship to distribute a thrust that Blake knew must be tremendous. Heavy conduits took the blast that it produced and poured it from ports at bow and stern. There were other outlets, too, above and below and on the sides, and electric controls that were manipulated from a central board.

“You’ve got a ship,” Blake admitted, “and it’s a beauty. I know construction, and you’ve got it here. But what is the power? How do you drive it? What throws it out through space?”

“Aside from one other, you will be the only man ever to know.” The bearded man was quiet now and earnest. The wild light had faded from his eyes, and he pondered gravely in making the last and final

decision.

“Yes, you shall have it. It may be I have been mistaken. I have known people—some few—who were kindly and decent; I have let the others prejudice me. But there was one who was my companion—and there was McGuire, who was kind and who believed. And now you, who will give your life for a friend and to save humanity!... You shall have it. You shall have the ship! But I will not go with you. I want nothing of glory or fame, and I am too old to fight. My remaining years I choose to spend out here.” He pointed where a window of heavy glass showed the outer world and a grave on a sloping hill.

“But you shall have full instructions. And, for the present, you may know that it is a continuous explosion that drives the ship. I have learned to decompose water into its components and split them into subatomic form. They reunite to give something other than matter. It is a liquid—liquid energy, though the term is inaccurate—that separates out in two forms, and a fluid ounce of each is the product of thousands of tons of water. The potential energy is all

there. A current releases it; the energy components reunite to give matter again—hydrogen and oxygen gas. Combustion adds to their volume through heat.

“It is like firing a cannon in there,”—he pointed now to the massive generator—“a super-cannon of tremendous force and a cannon that fires continuously. The endless pressure of expansion gives the thrust that means a constant acceleration of motion out there where gravity is lost.

“You will note,” he added, “that I said ‘constant acceleration.’ It means building up to speeds that are enormous.”

Blake nodded in half-understanding.

“We will want bigger ships,” he mused. “They must mount guns and be heavy enough to take the recoil. This is only a sample; we must design, experiment, build them! Can it be done? ... It *must* be done!” he concluded and turned to the inventor.

“We don’t know much about those devils of the stars,

and they may have means of attack beyond anything we can conceive, but there is just one way to learn: go up there and find out, and take a licking if we have to. Now, how about taking me up a mile or so in the air?"

The other smiled in self-deprecation. "I like a good fighter," he said; "I was never one myself. If I had been I would have accomplished more. Yes, you shall go up a mile or so in the air—and a thousand miles beyond." He turned to close the door and seal it fast.

Beside the instrument board he seated himself, and at his touch the generator of the ship came startingly to life. It grumbled softly at first, then the hoarse sound swelled to a thunderous roar, while the metal grating surged up irresistibly beneath the captain's feet. His weight was intolerable. He sank helplessly to the floor....

Blake was white and shaken when he alighted from the ship an hour later, but his eyes were ablaze with excitement. He stopped to seize the tall man by the shoulders.

“I am only a poor devil of a flying man,” he said, “but I am speaking for the whole world right now. You have saved us; you’ve furnished the means. It is up to us now. You’ve given us the right to hope that humanity can save itself, if humanity will do it. That’s my next job—to convince them. We have less than a year and a half....”

There was one precious week wasted while Captain Blake chafed and waited for a conference to be arranged at Washington. A spirit of hopelessness had swept over the world—hopelessness and a mental sloth that killed every hope with the unanswerable argument: “What is the use? It is the end.” But a meeting was arranged at Colonel Boynton’s insistence, though his superiors scoffed at what he dared suggest.

Blake appeared before the meeting, and he told them what he knew—told it to the last detail, while he saw the looks of amusement or commiseration that passed from man to man.

There were scientists there who asked him coldly a

question or two and shrugged a supercilious shoulder; ranking officers of both army and navy who openly excoriated Colonel Boynton for bringing them to hear the wild tale of a half-demented man. It was this that drove Blake to a cold frenzy.

The weeks of hopeless despair had worn his nerves to the breaking point, and now, with so much to be done, and so little time in which to do it, all requirements of official etiquette were swept aside as he leaped to his feet to face the unbelieving men.

“Damn it!” he shouted, “will you sit here now and quibble over what you think in your wisdom is possible or not. Get outside those doors—there’s an open park beyond—and I’ll knock your technicalities all to hell!”

The door slammed behind him before the words could be spoken to place him under arrest, and he tore across a velvet lawn to leap into a taxi.

There was a rising storm of indignant protest within the room that he had left. There were admirals,

purple of face, who made heated remarks about the lack of discipline in the army, and generals who turned accusingly where the big figure of Colonel Boynton was still seated.

It was the Secretary of War who stilled the tumult and claimed the privilege of administering the rebuke which was so plainly needed. "Colonel Boynton," he said, and there was no effort to soften the cutting edge of sarcasm in his voice, "it was at your request and suggestion that this outrageous meeting was held. Have you any more requests or suggestions?"

The colonel rose slowly to his feet.

"Yes, Mr. Secretary," he said coldly, "I have. I know Captain Blake. He seldom makes promises; when he does he makes good. My suggestion is that you do what the gentleman said—step outside and see your technicalities knocked to hell." He moved unhurriedly toward the door.

It was a half-hour's wait, and one or two of the more openly skeptical had left when the first roar came

faintly from above. Colonel Boynton led the others to the open ground before the building. "I have always found Blake a man of his word," he said quietly, and pointed upward where a tiny speck was falling from a cloud-flecked sky.

Captain Blake had had little training in the operation of the ship, but he had flown it across the land and had concealed it where fellow officers were sworn to secrecy. And he felt that he knew how to handle the controls.

But the drop from those terrible heights was a fearful thing, and it ended only a hundred feet above the heads of the cowering, shouting humans who crouched under the thunderous blast, where a great shell checked its vertical flight and rebounded to the skies.

Again and again the gleaming cylinder drove at them like a projectile from the mortars of the gods, and it roared and thundered through the air or turned to vanish with incredible speed straight up into the heights, to return and fall again ... until finally it hung

motionless a foot above the grass from which the uniformed figures had fled. Only Colonel Boynton was there to greet the flyer as he laid his strange craft gently down.

“Nice little show, Captain,” he said, while his broad face broke into the widest of grins. “A damn nice little show! But take that look off of your face. They’ll listen to you now; they’ll eat right out of your hand.”

Chapter 15

If Lieutenant McGuire could have erased from his mind the thought of the threat that hung over the earth he would have found nothing but intensest pleasure in the experiences that were his.

But night after night they had heard the reverberating echoes of the giant gun speeding its messenger of death toward the earth, and he saw as plainly as if he were there the terrible destruction that must come where the missiles struck. Gas, of course; that seemed the chief and only weapon of these monsters, and Djorn, the elected leader of the Venus folk, confirmed him in this surmise.

“We had many gases,” he told McGuire, “but we used them for good ends. You people of Earth—or these invaders, if they conquer Earth—must some day engage in a war more terrible than wars between men. The insects are your greatest foe. With a developing civilization goes the multiplication of insect and bacterial life. We used the gases for that war, and we made this world a heaven.” He sighed

regretfully for his lost world.

“These red ones found them, and our factories for making them. But they have no gift for working out or mastering the other means we had for our defense—the electronic projectors, the creation of tremendous magnetic fields: you saw one when we destroyed the attacking ships. Our scientists had gone far—”

“I wish to Heaven you had some of them to use now,” said the lieutenant savagely, and the girl, Althora, standing near, smiled in sympathy for the flyer’s distress. But her brother, Djorn, only murmured: “The lust to kill: that is something to be overcome.”

The fatalistic resignation of these folk was disturbing to a man of action like McGuire. His eyes narrowed, and his lips were set for an abrupt retort when Althora intervened.

“Come,” she said, and took the flyer’s hand. “It is time for food.”

She took him to the living quarters occupied by her

brother and herself, where opal walls and jewelled inlays were made lovely by the soft light that flooded the rooms.

“Just one tablet,” she said, and brought him a thin white disc, “then plenty of water. You must take this compressed food often and in small quantities till your system is accustomed.”

“You make this?” he asked.

“But certainly. Our chemists are learned men. We should lack for food, otherwise, here in our underground home.”

He let the tablet dissolve in his mouth. Althora leaned forward to touch his hand gently.

“I am sorry,” she said, “that you and Djorn fail to understand one another. He is good—so good! But you—you, too, are good, and you fear for the safety of your own people.”

“They will be killed to the last woman and child,” he

replied, "or they will be captured, which will be worse."

"I understand," she told him, and pressed his hand; "and if I can help, Lieutenant Mack Guire, I shall be so glad."

He smiled at her stilted pronunciation of his name. He had had the girl for an almost constant companion since his arrival; the sexes, he found, were on a level of mutual freedom, and the girl's companionship was offered and her friendship expressed as openly as might have been that of a youth. Of Sykes he saw little; Professor Sykes was deep in astronomical discussions with the scientists of this world.

But she was charming, this girl of a strange race so like his own. A skin from the velvet heart of a rose and eyes that looked deep into his and into his mind when he permitted; eyes, too, that could crinkle to ready laughter or grow misty when she sang those weird melodies of such thrilling sweetness.

Only for the remembrance of Earth and the horrible

feeling of impotent fury, Lieutenant McGuire would have found much to occupy his thoughts in this loveliest of companions.

He laughed now at the sounding of his name, and the girl laughed with him.

“But it *is* your name, is it not?” she asked.

“Lieutenant Thomas McGuire,” he repeated, “and those who like me call me ‘Mac.’”

“Mac,” she repeated. “But that is so short and hard sounding. And what do those who love you say?”

The flyer grinned cheerfully. “There aren’t many who could qualify in that respect, but if there were they would call me Tommy.”

“That is better,” said Althora with engaging directness; “that is much better—Tommy.” Then she sprang to her feet and hurried him out where some further wonders must be seen and exclaimed over without delay. But Lieutenant McGuire saw the pink

flush that crept into her face, and his own heart responded to the telltale betrayal of her feeling for him. For never in his young and eventful life had the man found anyone who seemed so entirely one with himself as did this lovely girl from a distant star.

He followed where she went dancing on her way, but not for long could his mind be led away from the menace he could not forget. And on this day, as on many days to come, he struggled and racked his brain to find some way in which he could thwart the enemy and avert or delay their stroke.

It was another day, and they were some months on their long journey away from the earth when an inspiration came. Althora had offered to help, and he knew well how gladly she would aid him; the feeling between them had flowered into open, if unspoken love. Not that he would subject her to any danger—he himself would take all of that when it came—but meanwhile—

“Althora,” he asked her, “can you project your mind into that of one of the reds?”

“I could, easily,” she replied, “but it would not be pleasant. Their minds are horrible; they reek of evil things.” She shuddered at the thought, but the man persisted.

“But if you could help, would you be willing? I can do so little; I can never stop them; but I may save my people from some suffering at least. Here is my idea:

“Djorn tells me that I had it figured right: they plan an invasion of the earth when next the two planets approach. He has told me of their armies and their fleets of ships that will set off into space. I can’t prevent it; I am helpless! But if I knew what their leader was thinking—”

“Torg!” she exclaimed. “You want to know the mind of that beast of beasts!”

“Yes,” said the man. “It might be of value. Particularly if I could know something of their great gun—where it is and what it is—well, I might do something about that.”

The girl averted her eyes from the savage determination on his face. “No—no!” she exclaimed; “I could not. Not Torg!”

McGuire’s own face fell at the realization of the enormity of this favor he had demanded. “That’s all right,” he said and held her soft hand in his; “just forget it. I shouldn’t have asked.”

But she whispered as she turned to walk away: “I must think, I must think. You ask much of me, Tommy; but oh, Tommy, I would do much for you!” She was sobbing softly as she ran swiftly away.

And the man in khaki—this flyer of a distant air-service—strode blindly off to rage and fume at his helplessness and his inability to strike one blow at those beings who lived in that world above.

There were countless rooms and passages where the work of the world below went on. There were men and women whose artistic ability found outlet in carvings and sculpture, chemists and others whose work was the making of foods and endless

experimentation, some thousand of men and women in the strength of their endless youth, who worked for the love of the doing and lived contentedly and happily while they waited for the day of their liberation. But of fighters there were none, and for this Lieutenant McGuire grieved wholeheartedly.

He was striding swiftly along where a corridor ended in blackness ahead. There was a gleaming machine on the floor beside him when a hand clutched at his arm and a warning voice exclaimed: "No further, Lieutenant McGuire; you must not go!"

"Why?" questioned the lieutenant. "I've got to walk—do something to keep from this damnable futile thinking."

"But not there," said the other; "it is a place of death. Ten paces more and you would have vanished in a flicker of flame. The projector"—he touched the mechanism beside them—"is always on. Our caves extend in an endless succession; they join with the labyrinth where the red ones used to live. They could attack us but for this. Nothing can live in its invisible

ray; they are placed at all such entrances.”

“Yet Djorn,” McGuire told himself slowly, “said they had no weapons. He knows nothing of war. But, great heavens! what wouldn’t I give for a regiment of scrappers—good husky boys with their faces tanned and a spark in their eyes and their gas masks on their chests. With a regiment, and equipment like this—”

And again he realized the futility of armament with none to serve and direct it.

It was a month or more before Althora consented to the tests. Djorn advised against it and made his protest emphatic, but here, as in all things, Althora was a free agent. It was her right to do as she saw fit, and there was none to prevent in this small world where individual liberty was unquestioned.

And it was still longer before she could get anything of importance. The experiments were racking to her nerves, and McGuire, seeing the terrible strain upon her, begged her to stop. But Althora had gained the vision that was always before her loved one’s eyes—a

world of death and disaster—and he, here where the bolt would be launched, and powerless to prevent. She could not be dissuaded now.

It was a proud day for Althora when she sent for McGuire, and he found her lying at rest, eyes closed in her young face that was lined and tortured with the mental horror she was contacting. She silenced his protests with a word.

“The gun,” she whispered; “they are talking about the gun ... and the bombardment ... planning....”

More silent concentration. Then:

“The island of Bergo,” she said, “—remember that! The gun is there ... a great bore in the earth ... solid rock ... but the casing of titanite must be reinforced ... and bands shrunk about the muzzle that projects ... heavy bands ... it shows signs of distortion—the heat! ...”

She was listening to the thoughts, and selecting those that bore upon gun.

“... Only fifty days ... the bombardment must begin ... Tahnor has provided a hundred shells; two thousand tals of the green gas-powder in each one ... the explosive charges ready ... yes—yes!...”

“Oh!” she exclaimed and opened her troubled eyes. “The beast is so complacent, so sure! And the bombardment will begin in fifty days! Will it really cause them anguish on your Earth, Tommy?”

“Just plain hell; that’s all!”

McGuire’s voice was low; his mind was reaching out to find and reject one plan after another. The gun!... He must disable it; he could do that much at least. For himself—well, what of it?—he would die, of course.

The guard he had been taught to place about his own thoughts must have relaxed, for Althora cried out in distress.

“No—no!” she protested; “you shall not! I have tried to help you, Tommy dear—say that I have helped you! —but, oh, my beloved, do not go. Do not risk your life

to silence this one weapon. They would still have their ships. Remember what Djorn has told of their mighty fleets, their thousands of fighting men. You cannot stop them; you can hardly hinder them. And you would throw away your life! Oh, please do not go!”

McGuire was seated beside her. His face was hidden in one hand while the other was held tight between the white palms of Althora’s tense hands. He said nothing, and he shielded his eyes and locked his mind against her thought force.

“Tommy,” said Althora, and now her voice was all love and softness, “Tommy, my dear one! You will not go, for what can you do? And if you stay—oh, my dear!—you can have what you will—the secret of life shall be yours—to live forever in perpetual youth. You may have that. And me, Tommy.... Would you throw your life away in a hopeless attempt, when life might hold so much? Am I offering so little, Tommy?”

And still the silence and the hand that kept the eyes from meeting hers; then a long-drawn breath and a slim figure in khaki that stood unconsciously erect to

look, not at the girl, but out beyond the solid walls, through millions of miles of space, to the helpless speck called Earth.

“You offer me heaven, my dear,” he spoke softly. “But sometimes”—and his lips twisted into a ghost of a smile—“sometimes, to earn our heaven, we have to fight like hell. And, if we fail to make the fight, what heaven worth having is left?”

“And the people,” he said softly; “the homes in the cities and towns and villages. My dear, that’s part of loving a soldier: you can never own him altogether; his allegiance is divided. And if I failed my own folk what right would I have to you?”

He dared to look at the girl who lay before him. That other vision was gone but he had seen a clear course charted, and now, with his mind at rest, he could smile happily at the girl who was looking up at him through her tears.

She rose slowly to her feet and stood before him to lay firm hands upon his shoulders. She was almost as

tall as he, and her eyes, that had shaken off their tears but for a dewy fringe, looked deep and straight into his.

“We have thought,” she said slowly, “we people of this world, that we were superior to you and yours; we have accepted you as someone a shade below our plane of advancement. Yes, we have dared to believe that. But I know better. We have gone far, Tommy, we people of this star; we have lived long. Yet I am wondering if we have lost some virtues that are the heritage of a sterner race.

“But I am learning, Tommy; I am so thankful that I can learn and that I have had you to teach me. We will go together, you and I. We will fight our fight, and, the Great One willing, we will earn our heaven or find it elsewhere—together.”

She leaned forward to kiss the tall man squarely upon the lips with her own soft rose-petal lips that clung and clung ... and the reply of Lieutenant McGuire, while it was entirely wordless, seemed eminently satisfactory.

Althora, the beautiful daughter of Venus, had the charm and allure of her planet's fabled namesake. But she thought like a man and she planned like a man. And there was no dissuading her from her course. She was to fight beside McGuire—that was her intention—and beyond that there was no value in argument. McGuire was forced to accept the insistent aid, and he needed help.

Sykes dropped his delving into astronomical lore and answered to the call, but there was no other assistance. Only the three, McGuire, Althora and Sykes. There were some who would agree to pilot the submarine that was being outfitted, but they would have no part in the venture beyond transporting the participants.

More than once McGuire paused to curse silently at the complaisance of this people. What could he not do if they would help. Ten companies of trained men, armed with their deadly electronic projectors that disintegrated any living thing they reached—and he would clutch at his tousled hair and realize that they were only three, and go grimly back to work.

“I don’t know what we can do till we get there,” he told Sykes. “Here we are, and there is the gun: that is all we know, except that the thing must be tremendous and our only hope is that there is some firing mechanism that we can destroy. The gun itself is a great drilling in the solid rock, lined with one of their steel alloys, and with a big barrel extending up into the air: Althora has learned that.

“They went deep into the rock and set the firing chamber there; it’s heavy enough to stand the stress. They use a gas-powder, as Althora calls it, for the charge, and the same stuff but deadlier is in the shell. But they must have underground workings for loading and firing. Is there a chance for us to get in there, I wonder! There’s the big barrel that projects. We might ... but no!—that’s too big for us to tackle, I’m afraid.”

“How about that electronic projector on the submarine?” Sykes suggested. “Remember how it melted out the heart of that big ship? We could do a lot with that.”

“Not a chance! Djorn and the others have strictly forbidden the men to turn it on the enemy since they have given no offense.

“No offense!” he repeated, and added a few explosive remarks.

“No, it looks like a case of get there and do what dirty work we can to their mechanism before they pot us—and that’s that!”

But Sykes was directing his thoughts along another path.

“I wonder ...” he mused; “it might be done: they have laboratories.”

“What are you talking about? For the love of heaven, man, if you’re got an idea, let’s have it. I’m desperate.”

“Nitrators!” said the scientist. “I have been getting on pretty good terms with the scientific crowd here, and I’ve seen some mighty pretty manufacturing

laboratories. And they have equipment that was never meant for the manufacture of nitro-explosives, but, with a few modifications—yes, I think it could be done.”

“You mean nitro-glycerine? TNT?”

“Something like that. Depends upon what materials we can get to start with.”

The lieutenant was pounding his companion upon the back and shouting his joy at this faintest echo of encouragement.

“We’ll plant it alongside the gun—No, we’ll get into their working underground. We’ll blow their equipment into scrap-iron, and perhaps we can even damage the gun itself!” He was almost beside himself with excitement at thought of a weapon being placed in his straining helpless hands.

It was the earth-shaking thunder of the big gun that hastened their final preparations and made McGuire tremble with suppressed excitement where he helped

Sykes to draw off a syrupy liquid into heavy crystal flasks.

There were many of these, and the two men would allow no others to touch them, but stored them themselves and nested each one in a soft bed within the submarine. Then one last repetition of their half-formed plans to Djorn and his followers and a rush toward the wharf where the submarine was waiting.

Althora was waiting, too, and McGuire wasted minutes in a petition that he knew was futile.

“Wait here, Althora,” he begged. “I will come back; this is no venture for you to undertake. I can take my chances with them, but you—! It is no place for you,” he concluded lamely.

“There is no other place for me,” she said; “only where you are.” And she led the way while the others followed into the lighted control room of the big under-water craft.

McGuire’s eyes were misty with a blurring of tears

that were partly from excitement, but more from a feeling of helpless remonstrance that was mingled with pure pride. And his lips were set in a straight line.

The magnetic pull that held them to their anchorage was reversed; the ship beneath them was slipping smoothly beneath the surface and out to sea, guided through its tortuous windings of water-worn caves and rocky chambers under the sea by the invisible electric cords that drew it where they would.

And ahead on some mysterious island was a gun, a thing of size and power beyond anything of Earth. He was going to spike that gun if it was the last act of his life; and Althora was going with him. He drew her slim body to him, while his eyes stared blindly, hopefully, toward what the future held.

Chapter 16

Throughout the night they drove hour after hour at terrific speed. The ship was running submerged, for McGuire was taking no slightest chance of their being observed from the air. He and the others slept at times, for the crew that handled the craft very evidently knew the exact course, and there were mechanical devices that insured their safety. A ray was projected continuously ahead of them; it would reflect back and give on an indicator instant warning of any derelict or obstruction. Another row of quivering needles gave by the same method the soundings from far ahead.

But the uncertainty of what their tomorrow might hold and the worry and dread lest he find himself unable to damage the big gun made real rest impossible for McGuire.

But he was happy and buoyant with hope when, at last, the green light from the ports showed that the sun was shining up above, and the slackening drive of the submarine's powerful motors told that their

objective was in sight.

They lay quietly at last while a periscope of super-sensitiveness was thrust cautiously above the water. It brought in a panoramic view of the shoreline ahead, amplified it and projected the picture in clear-cut detail upon a screen. If Lieutenant McGuire had stood on the wet deck above and looked directly at the island the sight could have been no clearer. The colors of torn and blasted tree-growths showed in all their pale shades, and there was stereoscopic depth to the picture that gave no misleading illusions as to distance.

The shore was there with the white spray of breakers on a rocky shoal, and a beach beyond. And beyond that, in hard outline against a golden sky, was a gigantic tube that stood vertically in air to reach beyond the upper limits of the periscope's vision.

McGuire tingled at the sight. To be within reach of this weapon that had sent those blasting, devastating missiles upon the earth! He paced back and forth in the small room to stop and stare again, and resume

his pacing that helped to while away the hours they must wait. For there were man-shapes swarming over the land, and the dull, blood-red of their loose uniforms marked them as members of the fighting force spawned by this prolific breed.

“Not a chance until they’re out of the picture,” said the impatient man; “they would snow us under. It’s just as I thought: we must wait until the gun is ready to fire; then they will beat it. They won’t want to be around when that big boy cuts loose.”

“And then?” asked Althora.

“Then Sykes and I will take our collection of gallon flasks ashore, and I sure hope we don’t stumble.” He grinned cheerfully at the girl.

“That reinforced concrete dome seems to be where they get down into the ground; it is close to the base of the gun. We will go there—blow it open if we have to—but manage in some way to get down below. Then a time-fuse on the charge, and the boat will take me off, and we will leave as fast as these motors can drive

us.”

He omitted to mention any possible danger to Sykes and himself in the handling of their own explosive, and he added casually, “You will stay here and see that there is no slip-up on the getaway.”

He had to translate the last remark into language the girl could understand. But Althora shook her head.

“You do try so hard to get rid of me, Tommy,” the laughed, “but it is no use. I am going with you—do not argue—and I will help you with the attack. Three will work faster than two—and I am going.”

McGuire was silent, then nodded his assent. He was learning, this Earth-man, what individual freedom really meant.

Only the western sky showed golden masses on the shining screen when McGuire spoke softly to the captain:

“Your men will put us ashore; you may ask them to

stand by now.” And to Professor Sykes, “Better get that ‘soup’ of yours ready to load.”

The red-clad figures were growing dim on the screen, and the blotches of colors that showed where they were grouped were few. Some there were who left such groups to flee precipitately toward a waiting airship.

This was something the lieutenant had not foreseen. He had expected that the force that served the gun would have some shock-proof shelter; he had not anticipated a fighting ship to take them away.

“That’s good,” he exulted; “that is a lucky break. If they just get out of sight we will have the place to ourselves.”

There were no red patches on the screen now, and the picture thrown before them showed the big ship, its markings of red and white distinct even in the shadow-light of late afternoon, rising slowly into the air. It gathered speed marvelously and vanished to a speck beyond the land.

“We’re getting the breaks,” said McGuire crisply. “All right—let’s go!”

The submarine rose smoothly, and the sealed doors in the superstructure were opened while yet there was water to come trickling in. Men came with a roll of cloth that spread open to the shape of a small boat, while a metal frame expanded within it to hold it taut.

McGuire gasped with dismay as a seaman launched it and leaped heavily into the frail shell to attach a motor to one end.

“Metal!” the captain reassured him; “woven metal, and water-tight! You could not pierce it with anything less than a projector.”

Sykes was ready with one of the crystal flasks as the boat was brought alongside, and McGuire followed with another. They took ten of the harmless-looking containers, and both men held their breaths as the boat grounded roughly on the boulder-strewn shore.

They lifted them out and bedded them in the sand,

then returned to the submarine. This time Althora, too, stepped into the boat. They loaded in the balance of the containers; the motor purred. Another landing, and they stood at last on the island, where a mammoth tube towered into the sky and the means for its destruction was at their feet.

But there was little time; already the light was dimming, and the time for the firing of the big weapon was drawing near. The men worked like mad to carry the flasks to the base of the gun, where a dome of concrete marked the entrance to the rooms below.

Each man held a flask of the deadly fluid when Althora led the way where stairs went deep down into the earth under the domed roof. This part of the work had been foreseen, and the girl held a slender cylinder that threw a beam of light, intensely bright.

They found a surprising simplicity in the arrangements underground. Two rooms only had been carved from the solid rock, and one of these ended in a wall of gray metal that could be only the

great base of the gun. But nowhere was a complication of mechanism that might be damaged or destroyed, nor any wiring or firing device.

A round door showed sharp edges in the gray metal, but only the strength of many men could have removed its huge bolts, and these two knew there must be other doors to seal in the mighty charge.

“Not a wire!” the scientist exclaimed. “How do they fire it?” The answer came to him with the question.

“Radio, of course; and the receiving set is in the charge itself; the barrel of the gun is its own antenna. They must fire it from a distance—back on the island where we were, perhaps. It would need to be accurately timed.”

“Come on!” shouted McGuire, and raised the flask of explosive to his shoulder.

Each one knew the need for haste; each waited every moment for the terrible blast of gun-fire that would jar their bodies to a lifeless pulp or, by detonating

their own explosive, destroy them utterly. But they carried the flasks again to the top, and the three of them worked breathlessly to place their whole supply where McGuire directed.

The massive barrel of the gun was beside them; it was held in tremendous castings of metal that bolted to anchorage in the ground. One great brace had an overhanging flange; the explosive was placed beneath it.

Professor Sykes had come prepared. He attached a detonator to one of the flasks, and while the other two were placing the explosive in position he fastened two wires to the apparatus with steady but hurrying fingers; then at full speed he ran with the spool from which the wires unwound.

McGuire and Althora were behind him, running for the questionable safety of the sand-hills. Sykes stopped in the shelter of a tiny valley where winds had heaped the sand.

“Down!” he shouted. “Get down—behind that sand

dune, there!”

He dropped beside them, the bared ends of the wires in his hands. There was a battery, too, a case no larger than his hands. Professor Sykes, it appeared, had gained some few concessions from his friends, who had learned to respect him in the field of science.

One breathless moment he waited; then—

“Now!” he whispered, and touched the battery’s terminals with the bare wires.

To McGuire it seemed, in that instant of shattering chaos, that the great gun itself must have fired. He had known the jar of heavy artillery at close range; he had had experience with explosives. He had even been near when a government arsenal had thrown the countryside into a hell of jarring, ear-splitting pandemonium. But the concussion that shook the earth under him now was like nothing he had known.

The hill of sand that sheltered them vanished to sweep in a sheet above their heads. And the air struck

down with terrific weight, then left them in an airless void that seemed to make their bodies swell and explode. It rushed back in a whirling gale to sweep showers of sand and pebbles over the helpless forms of the three who lay battered and stunned.

An instant that was like an age; then the scientist pointed with a weak and trembling hand where a towering spire of metallic gray leaned slowly in the air. So slowly it moved, to the eyes of the watchers—a great arc of gathering force and speed that shattered the ground where it struck.

“The gun!” was all that the still-dazed lieutenant could say. “The—the gun!” And he fell to shivering uncontrollably, while tears of pure happiness streamed down his face.

The mammoth siege gun—the only weapon for bombardment of the helpless Earth—was a mass of useless metal, a futile thing that lay twisted and battered on the sands of the sea.

The submarine now showed at a distance; it had

withdrawn, by prearrangement, to the shelter of the deeper water. McGuire looked carefully at the watch on his wrist, and listened to make certain that the explosion had not stopped it. Sykes had told him the length of the Venusian day—twenty hours and nineteen minutes of Earth time, and he had made his calculations from the day of the Venusians. And, morning and night, McGuire had set his watch back and had learned to make a rough approximation of the time of that world.

The watch now said five-thirteen, and the sun was almost gone; a line of gold in the western sky; and McGuire knew that it was a matter only of minutes till the blast of the big gun would rock the island. One heavy section of the great barrel was resting upon the shattered base, and McGuire realized that this blocking of the monster's throat must mean it would tear itself and the island around it to fragments when it fired. He ran toward the beach and waved his arms wildly in air to urge on the speeding craft that showed dim and vague across the heaving sea.

It drove swiftly toward them and stopped for the

launching of the little boat. There was a delay, and McGuire stood quivering with impatience where the others, too, watched the huddle of figures on the submarine's deck.

It was Althora who first sensed their danger. Her voice was shrill with terror as she seized McGuire's arm and pointed landward.

"Tommy—Tommy!" she said. "They are coming! I saw them!"

A swarming of red figures over the nearby dunes gave quick confirmation of her words. McGuire looked about him for a weapon—anything to add efficiency to his bare hands—and the swarm was upon them as he looked.

He leaped quickly between Althora and the nearest figures that stretched out grasping hands, and a red face went white under the smashing impact of the flyer's fist.

They poured over the sand-hills now—scores of

leaping man-shapes—and McGuire knew in an instant of self-accusation that there had been a shelter after all, where a portion of the enemy force had stayed. The explosion had brought them, and now—

He struck in a raging frenzy at the grotesque things that came racing upon them. He knew Sykes was fighting too. He tore wildly at the lean arms that bound him and kept him from those a step or two away who were throwing the figure of a girl across the shoulders of one of their men, while her eyes turned hopelessly toward McGuire.

They threw the two men upon the sand and crowded to kneel on the prostrate bodies and strike and tear with their long hands, then tied them at ankles and wrists with metal cords, and raised them helpless and bound in the air.

One of the red creatures pointed a long arm toward the demolished gun and shrieked something in a terror-filled tone. The others, at the sound, raced off through the sand, while those with the burden of the three captives followed as best they could.

“The gun!” said Professor Sykes in a thick voice: the words were jolted out of him as the two who carried him staggered and ran. “They know—that it—hasn’t—gone off—”

The straggling troop that strung out across the dim-lit dunes was approaching another domed shelter of heavy concrete. They crowded inside, and the bodies of the three were thrown roughly to the floor, while the red creatures made desperate haste to close the heavy door. Then down they went into the deeper safety of a subterranean room, where the massive walls about them quivered to a nerve-deadening jar. It shook those standing to the floor, and the silence that followed was changed to a bedlam by the inhuman shrieking of the creatures who were gloating over their safety and the capture they had achieved. They leaped and capered in a maniacal outburst and ceased only at the shrill order of one who was in command.

At his direction the three were carried out of doors and thrown upon the ground. McGuire turned his head to see the face of Althora. There was blood

trickling from a cut on her temple, and her eyes were dazed and blurred, but she managed a trembling smile for the anxious eyes of the man who could only struggle hopelessly against the thin wires that held him.

Althora hurt! Bound with those cutting metal cords! Althora—in such beastly hands! He groaned aloud at the thought.

“You should never have come; I should never have let you. I have got you into this!” He groaned again in an agony of self-reproach, then lay silent and waited for what must come. And the answer to his speculations came from the night above, where the lights of a ship marked the approach of an enemy craft.

The ships of the red race could travel fast, as McGuire knew, but the air monster whose shining, pointed beak hung above them where they lay helpless in the torturing bonds of fine wire, was to give him a new conception of speed.

It shot to the five thousand-foot level, when the

captives were safe aboard, and the dark air shrieked like a tortured animal where the steel shell tore it to tatters. And the radio, in an adjoining room, never ceased in its sputtering, changing song.

The destruction of the Earth-bombarding gun! The capture of the two Earth-men who had dared to fight back! And a captive woman of the dreaded race of true Venusians! There was excitement and news enough for one world. And the discordant singing of the radio was sounding in the ears of the leaders of that world.

They were waiting on the platform in the great hall where Sykes and McGuire had stood, and their basilisk eyes glared unwinkingly down at the three who were thrown at their feet.

The leader of them all, Torg himself, arose from his ornate throne and strode forward for a closer view of the trophies his huntsmen had brought in. A whistled word from him and the wires that had bound Althora's slim ankles were cut, while a red-robed warrior dragged her roughly to her feet to stand

trembling and swaying as the blood shot cruelly through her cramped limbs.

Torg's eyes to McGuire were those of a devil feasting on human flesh, as he stared appraisingly and gloatingly at the girl who tried vainly to return the look without flinching. He spoke for a moment in a harsh tone, and the seated councilors echoed his weird notes approvingly.

"What does he say?" McGuire implored, though he knew there could be nothing of good in that abominable voice. "What does he say, Althora?"

The face that turned slowly to him was drained of the last vestige of color. "I—do not—know," she said in a whisper scarcely audible; "but he thinks—terrible things!"

She seemed speaking of some nightmare vision as she added haltingly, "There is a fleet of many ships, and Torg is in command. He has thousands of men, and he goes forth to conquer your Earth. He goes there to rule." She had to struggle to bring the words to her

lips now. "And—he takes me—with—him!"

"No—no!" the flyer protested, and he struggled insanely to free his hands from the wires that cut the deeper into his flesh. The voice of Althora, clear and strong now, brought him back.

"I shall never go, Tommy; never! The gift of eternal life is mine, but it is mine to keep only if I will. But, for you and your friend—" She tried to raise her hands to her trembling lips.

"Yes," said Lieutenant McGuire quietly, "for us—?"

But there were some things the soft lips of Althora refused to say. Again she tried vainly to raise her hands, then turned her white, stricken face that a loved one might not see the tears that were mingling with the blood-stains on her cheeks, nor read in her eyes the horror they beheld.

But she found one crumb of comfort for the two doomed men.

“You will live till the sailing of the ships, Tommy,” she choked, “and then—we will go together, Tommy—you and I.”

Her head was bowed and her shoulders shaking, but she raised her head proudly erect as she was seized by a guard whose blood-red hands forced her from the room.

And the dry, straining eyes of Lieutenant McGuire, that watched her going, saw the passing to an unknown fate of all he held dear, and the end of his unspoken dreams.

He scarcely felt the grip of the hands that seized him, nor knew when he and Sykes were carried from the room where Torg, the Emperor, held his savage court. The stone walls of the room where they were thrown could not hold his eyes; they looked through and beyond to see only the white and piteous face of a girl whose lips were whispering: “We will go together, Tommy—you and I.”

Chapter 17

The little ship that Captain Blake had thrown with reckless speed through the skies over Washington, D. C., made history that day in the records of the earth. None, now, could doubt that here, at last, was the answer that the world had hoped for until hope had died. Unbelievable in its field of action, incredible in its wild speed, but real, nevertheless!—the countries of the earth were frantic in their acclaim. Only the men who formed the International Board of Defense failed to join in the enthusiasm. They sat by day and night in earnest conference on ways and means.

From Earth and sub-Venus converge a titanic offensive of justice on the unspeakable man-things of Torg.

This little ship—so wonderful, and so inadequate! It was only a promise of what might come. There must be new designs made; men must learn to dream in new terms and set down their dreams in cold lines and figures on drafting boards. A cruiser of space must be designed, to mount heavy guns, carry great

loads, absorb the stresses that must come to such a structure in flight and in battle. And above all, it must take the thrust of this driving force—new and tremendous—of which men knew so little as yet. And then many like it must be built.

The fuel must be prepared, and this, alone, meant new and different machinery, which itself must be designed before the manufacturing process could begin.

There was work to be done—a world of work!—and so few months in which to do it. The attack from the distant gun had long since ceased and the instruments of the astronomers showed the enemy planet shrinking far off in space. But it would return; there was only a year for preparation.

Captain Blake was assigned to the direction of design. An entire office building in Washington was vacated for his use, and in a few hours he rallied a staff of assistants who demanded the entire use of a telephone system that spread countrywide. And the call went out that would bring the best brains of the

land to the task before them.

The windows of the building shone brightly throughout the nights when the call was answered, and engineers and draftsmen worked at fever heat on thrusts and stresses and involved mathematical calculations. And, while owners of great manufacturing plants waited with unaccustomed patience for a moment's talk with Blake, the white sheets on the drafting boards showed growing pictures of braces and struts and curved plates, of castings for gun mounts, and ammunition hoists. And the manufacturers were told in no uncertain terms exactly what part of this experimental ship they would produce, and when it must be delivered.

"If only we dared go into production," said Blake; "but it is out of the question. This first ship must demonstrate its efficiency; we must get the 'bugs' out of our design; correct our errors and be ready with a production schedule that will work with precision."

Only one phase of this proposed production troubled him; the manufacture must be handled all over the

world. He talked with men from England and France, from Germany and Italy and a host of other lands, and he raged inwardly while he tried to drive home to them the necessity for handling the work in just one way—his way—if results were to be achieved.

The men of business he could convince, but his chief disquiet came from those whose thoughts were of what they termed "statesmanship," and who seemed more apprehensive of the power that this new weapon would give the United States of America than they were of the threat from distant worlds.

From his friends in high quarters came hints of the same friction, but he knew that the one demand Winslow had laid down was being observed: the secret of the mysterious fuel would remain with us. Winslow had shown little confidence in the countries of the old world, and he had sworn Blake to an agreement that his strange liquids—that new form of matter and substance—should remain with this country.

And swiftly the paper ship grew. The parts were in

manufacture, and arriving at the assembly plant in Ohio. Blake's time was spent there now, and he caught only snatches of sleep on a cot in his office, while he worked with the forces of men who succeeded each other to keep the assembly room going night and day.

There was an enormous hangar that was designed for the assembling of a giant dirigible; it housed another ship now. Hardly a ship, yet it began to take form where great girders held the keel that was laid, and duralumin plates and strong castings were bolted home.

A thousand new problems, and innumerable vexing errors—the "bugs" that inhere with a new, mechanical job—yet the day came when the ship was a thing of sleek beauty, and her thousand feet of length enclosed a maze of latticed struts where ammunition rooms and sleeping quarters, a chart room and control stations were cleverly interspaced. And above, where the great shape towered high in the big hangar, were the lean snouts of cannon, and recesses that held rapid-fire guns and whole batteries of

machine guns for close range.

Rows of great storage batteries were installed, to furnish the first current for the starting of the ship, till her dynamos that were driven by the exhaust blast itself could go into action and carry on. And then—

An armored truck that ground slowly up under heavy guard to deliver two small flasks of liquid whose tremendous weight must be held in containers of thick steel, and be hoisted with cranes to their resting place within the ship. And Captain Blake, with his heart in his throat through fear of some failure, some slip in their plans—Captain Blake, of the gaunt, worn frame, and face haggard from sleepless nights—stood quietly at a control board while the great doors of the hangar swung open.

At the closing of a switch the current from the batteries flowed through the two liquids, to go on in conductors of heavy copper to a generator that was heavy and squat and devoid of moving parts. Within it were electrodes that were castings of copper, and between them the miracle of regenerated matter was

taking place.

What came to them as energy from the cables was transformed to a tangible thing—a vast bulk of gas, of hydrogen and oxygen that had once been water, and the pressure of the gas made a roaring inferno of the exhausts. A spark plug ignited it, and the heat of combustion added pressure to pressure, while the quivering, invisible live steam poured forth to change to vaporous clouds that filled the hangar.

The man at the control board stood trembling with knowledge of the power he had unleashed. He moved a lever to crack open a valve, and the clouds poured now from beneath the ship, that raised slowly and smoothly in the air. It hung quietly poised, while the hands that directed it sent a roaring blast from the great stern exhaust, and the creation of many minds became a thing of life that moved slowly, gliding out into the sunlight of the world.

The cheers of crowding men, insane with hysterical emotion at sight of their work's fulfillment, were lost in the thunder of the ship. The blunt bow lifted where

the sun made dazzling brilliance of her sweeping curves, and with a blast that thundered from her stern the first unit of the space forces of the Earth swept upward in an arc of speed that ended in invisibility. No enveloping air could hold her now; she was launched in the ocean of space that would be her home.

Captain Blake, the following day, sat in Washington before a desk piled high with telegrams of congratulation. His tired face was smiling as he replaced a telephone receiver that had spoken words of confidence and commendation from the President of the United States. But he pushed the mass of yellow papers aside to resume his examination of a well-thumbed folder marked: "Production Schedule." The real work was yet to be done.

It was only two short months later that he sat before the same desk, with a face that showed no mark of smiles in its haggard lines.

His ship was a success, and was flying continuously, while men of the air service were trained in its

manipulation and gunners received practice in three-dimensional range finding and cruiser practice in the air. Above, in the airless space, they learned to operate the guns that were controlled from within the air-tight rooms. They were learning, and the ship performed the miracles that were now taken as matters of fact.

But production!

Captain Blake rose wearily to attend a conference at the War Department. He had asked that it be called, and the entire service was represented when he reached there. He went without preamble or explanation to the point.

"Mr. Secretary," he said, and faced the Secretary of War, "I have to report, sir, that we have failed. It is utterly impossible, under present conditions, to produce a fleet of completed ships.

"You know the reason; I have conferred with you often. It was a mistake to depend on foreign aid; they have failed us. I do not criticize them: their ways are

their own, and their own problems loom large to them. The English production of parts has come through, or is proceeding satisfactorily, but the rest is in hopeless confusion. The Red menace from Russia is the prime reason, of course. With the Reds mobilizing their forces, we cannot blame her neighbors for preparing to defend themselves. But our program!—and the sure invasion that will come in six short months!—to be fighting among ourselves—it is damnable!"

He paused to stare in wordless misery at the silent gathering before him. Then—

"I have failed," he blurted out. "I have fallen down on the job. It was my responsibility to get the cooperation that insured success. Let me step aside. Is there anyone now who can take up the work and bring order and results from this chaos of futility?"

He waited long for a reply. It was the Secretary of War who answered in a quiet voice.

"We must not be too harsh," he said, "in our criticism

of our foreign friends, but neither should we be unfair to Captain Blake. You do yourself an injustice; there is no one who could have done more than you. The reason is here." He struck at a paper that he held in his hand. "Europe is at war. Russia has struck without warning; her troops are moving and her air force is engaged this minute in an attack upon Paris. It is a traitor country at home that has defeated us in our war with another world."

"I think," he added slowly, "there is nothing more that could have been done: you have made a brave effort. Let us thank you, Captain Blake, while we can. We will fight, when the time comes, as best we can; that goes without saying."

A blue and gold figure arose slowly to speak a word for the navy. "It is evident by Captain Blake's own admission, that the proposed venture must fail. It has been evident to some of us from the start." It was a fighter of the old school who was speaking; his voice was that of one whose vision has dimmed, who sees but the dreams of impractical visionaries in the newer inventions, and whose reliance for safety is placed

only in the weapons he knows.

"The naval forces of the United States will be ready," he told them, "and I would ask you to remember that we can still place dependence upon the ships that float in the water, and the forces who have manned them since the history of this country began."

Captain Blake had sprung to his feet. Again he addressed the Secretary for War.

"Mr. Secretary," he said, and there was a fighting glint in his eyes, "I make no reply to this gentleman. His arm of the service will speak for itself as it has always done. But your own words have given me new hope and new energy. I ask you, Mr. Secretary, for another chance. The industrial forces of the United States are behind us to the last man and the last machine. I have talked with them. I know!

"We have only six months left for a prodigious effort. Shall we make it? For the safety of our country and the whole world let us attempt the impossible: go ahead on our own; turn the energy and the mind of

this whole country to the problem.

"The great fleet of the world can never be. Shall we build and launch the Great Fleet of the United States, and take upon our own shoulders the burden and responsibility of defense?

"It cannot be done by reasonable standards, but the time is past for reason. Possible or otherwise, we must do it. We will—if you will back me in the effort!"

There was a rising discord of excited voices in the room. Men were leaping to their feet to shake vehement fists in the faces of those who wagged their heads in protest. The Secretary of War arose to still the storm. He turned to walk toward the waiting figure of Captain Blake.

"You can't do it," he said, and gripped the Captain by the hand; "you can't do it—but you may. This country has seen others who have done the impossible when the impossible had to be done. It's your job; the President will confirm my orders. Go to it, Blake!"

Chapter 18

The wires that bound the two men were removed, and McGuire and Sykes worked in agony to bring life back to the hands and feet that were swollen and blue.

Then—red guards who forced them to stumble on their numbed legs, where darting pains made them set their lips tight—a car that went swiftly through the darkness of a tube to stop finally in another building—a room with metal walls, one window with a balcony beyond, high above the ground—a door that clanged behind them; and the two men, looking one at the other with dismayed and swollen eyes, knew in their hearts that here, beyond a doubt, was their last earthly habitation.

They said nothing—there was nothing of hope or comfort to be said—and they dropped soddenly upon the hard floor, where finally the heavy breathing and nervous starts of Professor Sykes showed that to him at least had come the blessed oblivion of exhausted sleep. But there was no sleep for Lieutenant McGuire.

There was a face that shone too clearly in the dark,

and his thoughts revolved endlessly in words of reproach for his folly in allowing Althora's love to lead her to share his risk. From the night outside their window came a ceaseless clatter and hubbub, but to this he was oblivious.

Only with the coming of morning's soft golden light did McGuire know the reason for the din and activity that echoed from outside—and the reason, too, for their being placed in this room.

Their lives should end with the sailing of the fleet, and there, outside their window, were the ships themselves. Ships everywhere, as far as he could see across the broad level expanse, and an army of men who scurried like ants—red ones, who worked or directed the others, and countless blues and yellows who were loading the craft with enormous cargoes.

"Squawk, damn you!" said Lieutenant McGuire to the distant shrieking throng; "and I hope they're ready for you when you reach the earth." But his savage voice carried no conviction. What was there that Earth could do to meet this overwhelming assault?

"What is it?" asked Sykes. He roused from his sleep to work gingerly at his aching muscles, then came and stood beside McGuire.

"They have put us here as a final taunt," McGuire told him. "There is the fleet that is going to make our world into a nice little hell, and Torg, the beast! has put us here to see it leave. Then we get ours, and they don't know that we know that."

"Your first way was the best," the scientist observed; "we should have done it then. We still can."

"What do you mean?" The flyer's voice was dull and lifeless.

Sykes pointed to the little balcony and the hard pavement below.

"Althora," he said, and McGuire winced at the name, "seemed to think that we were in for some exquisite torture. Here is the way out. It is a hundred-foot drop; they think we are safe; but they have been unintentionally kind."

"Yes," his companion agreed, "they don't know that we know of the torture. We will wait ... and when I am sure that—Althora—is—gone ... when there is nothing I can do to help—"

"Help?" queried the professor gently. "There is nothing now of help, nor anyone who can help us. We must face it, my boy; *c'est fini*. Our little journey is approaching its end."

There was no reply, and McGuire stood throughout the day to stare with eyes of smouldering hatred where the scurrying swarms of living things made ready to invade and infest the earth.

Food and water was pushed through the doorway, but he ate sparingly of the odd-colored fruits; the only thing that could hold his thoughts from the hopeless repetition of unanswerable "whys" was the sight of the fleet. And every bale and huge drum was tallied mentally as it passed before his eyes. The ships were being loaded, and with their sailing—But, no! He must not let himself think of that!

Throughout the day ships came and departed, and one leviathan, ablaze in scarlet color; sailed in to settle down where great steel arms enfolded it, not far from the watching men. Scarlet creatures in authority directed operations, and workmen swarmed about the great ship. Once McGuire swore softly and viciously under his breath, for he had seen a figure that could be only that of Torg, and the crowd saluted with upraised arms as the scarlet figure passed into the scarlet ship. This, McGuire knew, was the flagship that should carry Torg himself. Torg and ——. He paled at the thought of the other name.

The only break in the long day came with the arrival of a squad of guards, who hustled the two men out into a passageway and drove them to another room, where certain measurements were taken. The muscular figures of the two were different from these red ones, but it was a moment before McGuire realized the sinister significance of the proceedings. Their breadth of shoulders, the thickness of their chests—what had these figures to do with their captivity? And then the flyer saw the measures

compared with the dimensions of a steel cage. Its latticed shape could be endlessly compressed, and within, he saw, were lancet points that lined the ghastly thing throughout. Long enough to torture, but not to kill; a thousand delicate blades to pierce the flesh; and the instrument, it seemed, was of a size that could enclose the writhing, helpless body of a man.

Other unnameable contrivances about the room took on new significance with the knowledge that here was the chamber of horrors whose workings had been seen by Althora in the mind of their captor—horrors of which she could not speak.

McGuire was sick and giddy as the guards led him roughly back to their prison room. And Professor Sykes, too, required no explanation of what they had seen.

The guards were many, and resistance was useless, but each man looked silently at the other's desperate eyes when the metal cords were twisted again about their wrists, and their hands were tied securely to

metal rings anchored in the wall beside the window.

"And there," said the flyer, "goes our last chance of escape. They were not as dumb as we thought: they knew how good a leap to the pavement would look after we had been in there."

"Less than human!" Sykes was quoting the comment of Althora's brother. "I think Djorn was quite conservative in his statement."

McGuire examined carefully the cords that tied his hands to the wall beside him. The knots were secure, and the metal ring was smooth and round. "I didn't know," he said, as he worked and twisted, "but there might be a cutting edge, but we haven't a chance. No getting rid of these without a wire cutter or an acetylene torch—and we seem to be just out of both."

Professor Sykes tried to adopt the other's nonchalant tone. "Careless of us," he began—then stopped breathless to press his body against the wall.

"It's there!" he said. "Oh, my God, if I could only get

it, it might work—it might!"

"The battery," he explained to the man beside him, whose assumed indifference vanished at this suggestion of hope; "—the little battery that I used on the gun, to fire the explosive. It has an astounding amperage, and a voltage around three hundred. It's in my pocket—and I can't reach it!"

"You can't keep a good man licked!" McGuire exulted. "You mean that the current might melt the wire?"

"Soften it, perhaps, depending upon the resistance." Sykes refused to share the other's excitement. "But we can't get at it."

"We've got to," was the answer. "Move over this way." The man in khaki twisted his arms awkwardly to permit him to bend his body to one side, and beads of sweat stood out on his forehead as the strain forced the thin bonds into his wrists. But he brought his agonized face against the other's body, and gripped the fabric of Sykes' coat between his teeth.

The twisting of his head raised the cloth an inch at a time, and despite Sykes' efforts to hold the garment with his elbow, it slipped back time and again.

McGuire straightened at intervals to draw a choking breath and ease the strain upon his tortured wrists; then back again in his desperate contortions to worry at the cloth and pull and hold—and try again to raise the heavy pocket where a battery made sagging folds.

He was faint and gasping when finally the cloth was brought where the scientist's straining fingers could grasp it to writhe and twist in clumsy efforts that would force the battery's terminals within reach.

"I'll try it on mine," said Sykes. "It may be hot—and you've had your share." He was holding the flat black thing to bring the copper tips against the metal about his wrists. McGuire saw the man's lips go white as a wisp of smoke brought to his nostrils the sickening odor of burned flesh.

The metal glowed, and the man was writhing in silent self-torture when at last he threw his weight upon the strands and fell backward to the floor. He lay for a

moment, trembling and quivering—but free. And the knowledge of that freedom and of the greater torture they would both escape, gave him strength to rise and work with crippled hands at his companion's bonds, till McGuire, too, was free—free to forget his own swollen, bleeding wrists in compassionate regard for the other.

Like an injured animal, Professor Sykes had licked with his tongue at his wrists, where hot wire had burned deep and white, and he was trying for forgetfulness an hour later, in examination of the door to their room.

"What is the idea?" McGuire inquired, when he turned from his ceaseless contemplation of the fleet. "Not trying to get out, are you?"

"I am trying to stay in," said Sykes, and looked again at the object that interested him. "These long bolts," he explained: "top and bottom; operated from outside, but exposed in here. They come together when unlocked; five inches apart now. If I had something to hold them apart—

"You haven't a piece of steel about five inches long, have you?—or anything to substitute for it? If you have, I can lock this door so the devils won't come in and surprise us before we can make the jump."

"The battery?" suggested McGuire.

Sykes shook his head. "I tried it. Too long, and besides it would crumble. They operate these with a lever; I saw it outside." He went on silently with his study of the door and the little gap between heavy bolts, which, if closed, would mean security from invasion.

"They're about through," McGuire spoke from his post at the window after some time. "The rush seems to be about over. I imagine they'll pull out in the morning."

He pointed as Sykes stood beside him. "Those big ones over beyond have not been touched all day; only some of the crew, I judge, working around them. And way over you see forty or fifty whaling big ones: they must have been ready before we came. They have finished on these nearer by. It looks like a big day for

the brutes."

And Professor Sykes led him on to talk more of the preparations he had seen, and his deductions as to the morrow. It was all too evident what was really on the lieutenant's mind. It was not the thought of their own immediate death, but the terrible dread and horror of Althora's fate, that hammered and hammered in his brain. To speak of anything else meant a moment's relief.

Sykes pointed to a tall mast that was set in the plaza pavement, some hundred feet away. Wires swung from it to several points, one of them ending above their window and entering the building. "What is that?" he asked, "—some radio device? That ball of metal on the top might be an aerial." But McGuire had fallen silent again, and stared stonily at the deadly fighting ships he was powerless to combat.

On the morning that followed, there was no uncertainty. This was the day! And from a balconied window up high in the side of a tall stone building, two men stood wordless and waiting while they

watched the preparations below.

The open space was a sea of motion like flowing blood, where thousands of figures in dull red marched in rank after rank to be swallowed in the mammoth ships that McGuire had noted in the distance. Then other colors, and swarms of what they took to be women-folk of this wild race—a medley of color that flowed on and on as if it would never cease, to fill one after another of the great ships.

"Transports, that's what they are," said McGuire. "I can see now why they have no steel beaks like the others. They don't need any rams, nor ports for firing that beastly gas. They are gray, too, while the fighting ships are striped with red, all except the scarlet one of Torg's. Those are colonists we are watching, and soldiers to conquer the Earth where the damned swarm settles."

He stopped to stare at a body of red-clad soldiers, drawn up at attention. They made a lane, and their arms were raised in the salute that seemed only for Torg. They stood rigid and motionless; then, from

below the watching men, came one in the full splendor of his scarlet regalia. The air echoed with the din of his shouted name, but the bedlam of noise fell on deaf ears for McGuire. He could hear nothing, and in all the vast kaleidoscope of color he could see only one object—the white face of a girl who was half led and half carried by a guard of the red ones, where their Emperor led the way.

It was a strangled cry that was torn from the flyer's throat—the name of this girl who was going to the doom she had failed to avoid. Her life, she had said, was hers to keep only if she willed, but her plans had failed, and she went faltering and stumbling after a scarlet man beast.

"Althora!" called the flyer, and the figure of the girl was struggling with her guards in a frenzy that tore their hands free. She turned to look toward the sound of the voice, and her face was like that of one dead as her eyes found the man she loved.

"Tommy," she called: "oh, Tommy, my dear! Good-by!" The words were ended by the clutch of the scarlet

Emperor who turned to seize her.

A clatter came from the door behind them, but Lieutenant McGuire gave no heed. Only Professor Sykes sprang back from the balcony to seize and struggle with the moving bolts.

The man on the balcony was hardly less than a maniac as he glared wildly about, but he was not too unreasoning to see the folly of a wild leap into the throng below. He could never reach her—never. And then his eyes fell upon the wire that led from above him to the great pole in the open plaza. There was shouting from behind where the executioners were wrestling with the bolts.

"Hold them," the flyer shouted, "just for a minute! For God's sake, Sykes, keep them back! There's a chance!"

He sprang to the balustrade of the balcony, but he saw as he leaped where Professor Sykes had raised his leg to force the thickness of his knee between the bolts whose levers outside were bringing them closer

together.

"Go to it," was the answer. "I can hold them"—a stifled groan—"for a—minute!" Professor Sykes had found his substitute for five inches of steel, and the living flesh yielded but slowly to the pressure of the bolts.

McGuire was working frantically at the wire, then held himself in check while he carefully unwound it from its fastening. There was a splice, and he worked with bleeding fingers to unfasten the tight coils. And then the end was free and in his hands. He dropped to the balcony to pull in the slack, and he wrapped the end about beneath his arms and twisted it tight, then leaped out into space. No thought of himself nor of Sykes in this one wild moment, only of Althora in the grip of those beastly hands.

He was struggling to turn himself in the air as the colored masses of people seemed sweeping toward him, and he shot as a living pendulum, feet first, into the waiting heads.

He was on his feet in an instant and tearing at the

twisted wire that held him. About him was clamor and confusion, but beyond the nearer figures he saw the one who waited, and beside her a thing in scarlet that shrieked orders to his men.

He flung off one who leaped toward him, and ducked another to dash through and reach his man. And he neither saw nor felt the creature's ripping talons as he drove a succession of rights and lefts to the blood-red face.

The scarlet one went backward under the fusillade of blows; he was down, a huddle of color upon the pavement, and a horde of paralyzed soldiers had recovered from their stupefaction and were rushing upon the flyer. He turned to meet them, but their rush ended as quickly as it began: only a step or two they came, then stopped, to add their wild voices to the confusion of ear-splitting shrieks that rose from all sides.

McGuire crouched rigid, tense and waiting, nor did he sense for an instant that the assault was checked and that the faces of all about him were turned to the sky.

It was the voice of Althora that aroused him:

"Tommy! Tommy!" she was calling, and now she was at his side, her arms about him. "What is it, Tommy? Look! Look!" And she too was gazing aloft. And then, above all other sounds McGuire heard the roar—

The clouds were golden above with the brilliance of midday—and against them, hard and sharp of outline, was a shining shape. A cloud of vapor streamed behind it as it shot down from the clouds, and the thunder of its coming was like the roar of many cannon.

A ship of the red ones was in the air—a fighting ship, whose stripes showed red—and it drove at the roaring menace with its steel beak and a swirling cloud of gas. It seemed that they must crash, when to McGuire's eyes came the stabbing flash of heavy guns from the shining shape. A crashing explosion came down to them as the great beak parted and fell, and the body of the red-striped monster opened in bursting smoke and flame, tore slowly into fragments and fell swiftly to the earth.

It struck with a shattering crash some distance away, but one pair of eyes failed to follow it in its fall. For in the clear air above, with the golden light of distant clouds upon it, a roaring monster of silvery sheen had rolled and swept upward to the heights. And it showed, as it turned, a painted emblem on its bow, a design of clear-cut color, unbelievably familiar—a circle of blue, and within it a white star and a bull's eye of red—the mark of the flying service of the United States!

McGuire never knew how he got Althora and himself back to the building whence he had come. Nor did he see the struggling figures on a balcony, or the leap and fall of a maimed body, where Professor Sykes, when the door had yielded, found surcease and oblivion on the pavement below.

He was to learn that later, but now he had eyes only for a sight that could be but a dream, an unreal vision of a disordered brain. He held the slim form of Althora to him in a crushing grip, while he stared, dry-eyed, above, and his own voice seemed to shout from afar off: "They're ours!" that voice was

screaming in a frenzy of exultation. "They're our ships! They've come across!"

The fighting fleet of the red man-things of Venus was taking to the air! The ships rose in a swarm of speeding, darting shapes, and the great one of Torg was in the lead, climbing in fury toward the heights.

Far above them the clouds of gold silhouetted a strange sight, and the air was shaking with the thunder from on high, where, straight and true, a line of silver ships in the sharp V of battle formation drove downward in a deadly, swift descent.

And even afar off, the straining eyes of a half-crazed man could see the markings on their bow—a circle and a star—and the colors of his own lost fighters of the air.

Chapter 19

The Earth-fleet was a slanting line of swiftness that swept downward from the clouds. A swarm of craft was rising from below. The red-striped fighters met the attack first with a cloud of gas.

The scarlet monster—the flagship of Torg, the Emperor—was in the lead, and they shot with terrific speed across the bows of the oncoming fleet to leave a whirlwind of deadly vapor as they passed. McGuire held his breath in an agony of fear as the cloud enveloped the line of ships, but their bow guns roared staccato crashes in the thunder of their exhausts as they entered the cloud. And they were firing from the stern as they emerged, while two falling cylinders of red and white proved the effectiveness of their fire.

The formation held true as it swept upward and back where the swarming enemy was waiting. They were outnumbered three to one, McGuire saw, and his heart sang within him as he watched the sharp, speeding V that climbed upward to the enemy's level then swung to throw itself like a lance of light at the

massed ships that awaited the attack.

Another cloud of gas!—and a shattered ship!—and again the line emerged to correct its broken formation and drive once more toward the circling swarm.

They came to meet them now, the clusters of red-striped fighting ships, and they tore in from all sides upon the American line, their hooked beaks gleaming in the sun.

And now, at an unseen signal, the formation broke. Each ship fought for its life, and the stabbing flashes of their guns made ceaseless jets of light against the smoke and gas clouds that were darkening the sky.

"A dog-fight!" breathed Lieutenant McGuire; "and what a dog-fight!" His words were lost in the terrific thunder from above: the roar of the ships and the dull thuds of the guns engulfed them in a maelstrom of noise that battered like physical blows on the watchers below. He swore unconsciously and called down curses upon the enemy as he saw two fighters

meet while the shining beak of a ship of the reds crashed through the body of an opposing craft.

The red ship dipped at the bow; it backed off with terrific force; and from the curved beak a ship with the insignia of the red, white and blue slid downward in a swift fall to the death that waited.

They had fought themselves clear, and the Americans, by what must have been arrangement or wireless order, went roaring to the heights. There were some who followed, but the guns of the speeding ships drove them off. Red-and-white shapes fell swiftly from the clouds where the fighting had been, and McGuire knew that his fellows had given an account of themselves in the fighting at close range.

Again the thundering line was sharp and true, and another unswerving attack was launching itself from above. And again the deadly formation, with ever-increasing speed, drove into the enemy with flashing guns, then parted to close with the ones that drove crushingly upon them, while the sharper clatter of rapid-firing guns came to shatter the air.

The fighting craft had been rising from their level field in a succession that seemed endless. They were all in the air now, and only the great transports remained on the paved field.

A red-striped fighter swept downward in retreat, and, from the smoke clouds, a silvery shape followed in pursuit. It reached the red and white one with its shells, and the great mass crashed with terrific impact on the field. Its pursuer must have seen the monsters still on the ground, and it swung to rake them with a shower of small-caliber shells.

There were machine-guns rattling as it passed above the thronged reds—the troops who were huddled in terror in the open court. It tore on past them—past a figure in khaki who raced forward with the golden form of a girl within his arms, then released her to wave frantically as the silver ship shot by.

Unobserved, McGuire and Althora had been, where they stood beside the buildings: the eyes of their enemies, like their own, were on the monstrous battle above. But now they had called themselves to the

attention of the reds, and there were some who rushed upon them with faces livid with rage.

McGuire reached for a weapon from a victim of the machine-gun fire and prepared to defend himself, but the weapon was never used. He saw the silvery shape reverse itself in the air; it turned sharply to throw itself back toward the solitary figure in uniform of their service and the golden-clad girl beside him.

The flyer raised his weapon, but the jostling swarm that rushed upon him melted: the ripping fire of machine guns was deafening in his ears. Their deadly tattoo continued while the great ship sank slowly to touch and rest its huge bulk upon the pavement. A door in the ship's curved side opened that the blocky figure of a man might leap forth.

He was grimy of face, and his uniform was streaked with the smoke and sweat of battle, but the face beneath the grime, and the hands that reached to embrace and pound the flyer upon the back, could be only those of one he had known as his captain—Captain Blake.

"You son-of-a-gun!" the shouting figure was repeating. "You damned Irish son-of-a-gun! A. W. O. L.—but you can't get away with it! Come on—get in here! I'm needed up above!"

McGuire was struggling to speak from a throat that was suddenly tight and voiceless. Then—

"Althora," he gasped; "take Althora!" and he motioned toward the girl. And then he remembered the companion he had left in the room above. The battle that had flashed so suddenly had blasted from his mind all other thoughts.

"My God!" he said. "—Sykes! I—must get Sykes!"

He turned to run back to the building, only to stop in consternation where a huddle of clothing lay beneath the balcony of their prison room.

It was Sykes—Sykes who had sacrificed himself to make possible the escape of his friend—and McGuire dropped to his knees to touch the body that he knew was shattered beyond any hope of life. He raised the

limp burden in his arms and staggered back where more khaki-clad figures had gathered. Two came quickly out to meet him, and he let them take the body of his friend.

"*C'est fini!*"—he repeated the words that Sykes had said; "the end of our little journey!" The arms of Althora were about him as Blake hurried them into the waiting ship, and the roar of enormous power marked the rising of this space ship to throw itself again into the fray.

A small room with a dome of shatter-proof glass; a pilot who sat there to look in all directions, a control-board beneath his hands. Beside him on his elevated station was room for Captain Blake, and McGuire and Althora, too. The ship was climbing swiftly. McGuire saw where flashing shapes circled and roared in a swelling cloud of smoke and gas.

Blake spoke sharply to an aide: "General orders! All ships climb to resume formation!"

An enemy ship was before them: it flashed from

nowhere to bear down with terrific speed. The floor beneath them shook with the jarring of heavy guns, and McGuire saw the advancing shape bursting with puffs of smoke, while their own ship shot upward with a sickening twist. A silver ship was falling!—and another!

"Two more of ours gone," said Captain Blake through set teeth. "How many of them are there, Mac? Tell me what you know: we've got a hell of a fight on our hands."

"They're all here," McGuire told him, in jerky, breathless speech. "These are transports on the ground. Their weapons are gas and speed, and the rams on their beaked ships. There are other weapons—deadlier ones!—but they haven't got them: they belong to another race. I'll tell you all that later!"

"Keep them at a distance, Blake," he said. "Make them come to you—then nail them as they come."

"Right!" was the answer; "that's good dope. We didn't know what they had; expected some devilish things

that could down us before we got within effective range; had to mix it with them to find out what they could do, and get in a few solid cracks before they did it.

"How high are we?" He glanced quickly at an instrument. "Ten thousand. Order all ships to withdraw," he instructed his aide. "Rendezvous at fifty thousand feet for echelon formation."

Another brush with an enemy craft that slipped quickly to one side—then the smoke clouds were behind them, and a score, of silvery shapes were climbing in vertical flight for the level at fifty thousand.

They were fewer now than they had been, and the line that formed behind the flagship of Blake was shorter than the one that had made the V which shot down so bravely to engage with an unknown foe.

The enemy was below; an arrangement of mirrors showed this from the commander's station. They were emerging from the clouds of smoke to swarm in

circling flight through the sky. And now the bow of their own craft was depressed at an order from Blake, and the others were behind them as they drove to renew the attack.

"They're ganging up on us again," said Blake. "We'll fool them this time; we'll just kid them a little."

The flagship swerved before reaching the enemy, and the others followed in what looked like frightened retreat. Again they were in the heights, and some few of the enemy were following. Blake led in another descent.

No waiting swarm to greet them now! Blake gave a quick order. The roaring column shifted position as it fell: the flagship was the apex of a great V whose arms flung out and backward on either side—a V formation that curved and twisted through space and thundered upon the smaller formations that scattered before the blasting guns.

"Our bow guns are the effective weapons," Blake observed; his casual tone was a sedative to McGuire's

tense nerves. "We can use a broadside only of lighter weight; the kick of the big 'sights' has to be taken straight back. But we're working, back home, on recoil-absorbing guns: we'll make fighting ships of these things yet."

He spoke quietly to the pilot to direct their course toward a group that came sweeping upon them, and the massed fire of the squadron was squarely into the oncoming beaks that fell beneath them where the mirrors showed them crashing to the earth.

They were scattered now; the enemy was in wild disorder; and Blake spoke sharply to his aide.

"Break formation," he ordered; "every ship for itself. Engage the enemy where they find them; shoot down anything they see; prevent the enemy reforming!" He was taking quick advantage of the other's scattered forces, and he scattered his own that he knew could take care of themselves while they engaged the enemy only by ones or twos or threes.

"Clear the air of them!" he ordered. "Not one of them

must escape!"

The skies were a maze of darting shapes that crossed and recrossed to make a spider's web of light. Ship drove at ship, to swerve off at the last, while the air quivered and beat upon them with the explosion of shells and guns.

"There's our meat!" Blake directed the pilot, and pointed ahead where a monster in scarlet was swelling into view.

It came swiftly upon them, darting down from above, and McGuire clutched at the arm of the man beside him to shout: "It's the leader; the flagship! It's the Emperor—Torg, himself! Give him hell, Blake, but look out—he's fast!"

The ship was upon them like a flash of fire; no time for anything but dodging, and the pilot threw his craft wildly aside with a swerve that sent the men sprawling against a stanchion. Then up and back, where the other had turned to come up from below.

"Fast!" McGuire had said, but the word was inadequate to describe the speed of the fiery shape.

Another leap in the air, as their pilot swung his controls, and the red shape brushed past them in a cloud of gas, while the quick-firers ripped futilely into space where the great ship had been.

"Get your bow guns on him!" Blake roared. The ship beneath them strained and shuddered with the incredible thunder of the generator that threw them bodily in the air. The pilot had opened in full force the ports that blasted their bows aside.

No time to gather new speed; they were motionless as the scarlet monster came upon them, but they were in position to receive him. The eight-inch rifles of the forward turret thundered again and again, to be answered by flashes of flame from the scarlet ship.

McGuire crouched over the bent form of the pilot, whose steady fingers held the ship's bow straight upon the flashing death that bore down upon them. Another salvo!—and another!—hits all of them....

Smoke bursting from ripping plates, and flaming fire more vivid than the scarlet shape itself!—and the floor beneath McGuire's feet drove crushingly upward as their pilot pulled a lever to the full.

The great beak flashed beneath—and the mirrors, where McGuire's eyes were fastened, showed the terrific drive continue down and down, where a brilliant cylinder that marked the power of Venus tore shriekingly on to carry an Emperor to his crashing death.

The skies were clear of the red-striped ships: only the survivors of the attacking force showed their silvery shapes as they gathered near their flagship. There were two that pursued a small group of the enemy, but they were being outdistanced in the race.

"We have won," said Blake in a tone of wonder that showed how only now had come a realization of what the victory meant. "We have won, and the earth—is saved!"

And the voice of McGuire echoed his fervent "Thank

God!" while he gripped the soft hand that clung tightly to his, as if Althora, this radiant creature of Venus, were timid and abashed among the joyful, shouting men-folk from another world.

"And now what, Captain?" asked McGuire of his command. "Will you land? There is an army of reds down there asking for punishment."

Blake had turned away; his hand made grimy smears across his face where he wiped away the tears that marked a brave man's utter thankfulness. He covered his emotion with an affectation of disapproval as he swung back toward McGuire.

"Captain?" he inquired. "Captain? Where do you get that captain stuff?"

He pointed to an emblem on his uniform, a design that was unfamiliar to the eyes of McGuire.

"You're talking to an admiral now!—the first admiral of the newest branch of your country's fighting service—commanding the first fleet of the Space ships

of the United States of America!" He threw one arm about the other's shoulders. "We'll have to get busy, Mac," he added, "and think up a new rank for you.

"And, yes, we are going to land," he continued in his customary tones; "there may be survivors of our own crashes. But we'll have to count on you, Mac, to show us around this little new world of yours."

There was an army waiting, as McGuire had warned, but it was waiting to give punishment and not to take it. The vast expanse of the landing field was swarming with them, and the open country beyond showed columns of marching troops.

They had learned, too, to take shelter; barricades had been hastily erected, and the men had shields to protect them from the fire of small arms.

Their bodies were enclosed in their gas-tight uniforms whose ugly head-pieces served only to conceal the greater ugliness beneath. They met the ships as they landed with a showering rain of gas that was fired from huge projectors.

"Not so good!" Blake was speaking in the safety of his ship. "We have masks, but great heavens, Mac!—there must be a million of those brutes. We can spray them with machine-gun fire, but we haven't ammunition enough to make a dent in them. And we've got to get out and get to our crashed ships."

He waited for McGuire's suggestions, but it was Althora who replied.

"Wait!" she said imperatively. She seemed to be listening to some distant word. Then:

"Djorn is coming," she exclaimed, and her eyes were brilliantly alight. "He says to you"—she pointed to McGuire—"that you were right, that we must fight like hell sometimes to deserve our heaven—oh, I told him what you said—and now he is coming with all his men!"

"What the devil?" asked Blake in amazement. "How does she know?"

"Telepathy," McGuire explained: "she is talking with

her brother, the leader of the real inhabitants of Venus."

He told the wondering man briefly of his experience and of the people themselves, the real owners of this world.

"But what can they do?" Blake demanded.

And McGuire assured him: "Plenty!"

He turned to Althora to ask, "How are they coming? How will they get here?"

"They are marching underground; they have been coming for two days. They knew of our being captured, but the people have been slow in deciding to fight. Djorn dared not tell me of their coming; he feared he might be too late.

"They will come out of that building," she said, and indicated the towering structure that had been their prison. "It has the old connection with the underground world."

"Well, they'd better be good!" said Blake incredulously.

He was still less optimistic when the building before them showed the coming of a file of men. They poured forth, in orderly fashion and ranged themselves in single file along the walls.

There must be a thousand, McGuire estimated, and he wondered if the women, too, were fighting for their own. Then, remembering Althora's brave insistence, he knew his surmise was correct.

Each one was masked against the gas; their faces were concealed; and each one held before him a tube of shining metal with a larger bulbous end that rested in their hands.

"Electronic projectors," the lieutenant whispered.

"Keep your eye on the enemy, Blake; you are going to learn something about war."

The thin line was advancing now and the gas billowed about them as they came. There were some few who

dropped, where masks were defective, but the line came on, and the slim tubes were before them in glittering menace.

At a distance of a hundred feet from the first of the entrenched enemy there was a movement along the line, as if the holders of the tubes had each set a mechanism in operation. And before the eyes of the Earth-men was a spectacle of horror like nothing in wars they had known.

The barricades were instantly a roaring furnace; the figures that leaped from behind them only added to the flames. From the steady rank of the attackers poured an invisible something before which the hosts of the enemy fell in huddles of flame. Those nearest were blasted from sight in a holocaust of horror, and where they had been was a scattering of embers that smoked and glowed; even the figures of distant ones stumbled and fell.

The myriad fighters of the army of the red ones, when the attackers shut off their invisible rays, was a screaming mob that raced wildly over the open lands

beyond.

Althora's hands were covering her eyes, but McGuire and Blake, and the crowding men about them, stared in awe and utter astonishment at the devastation that was sweeping this world. An army annihilated before their eyes! Scores of thousands, there must be, of the dead!

The voice of Blake was husky with horror. "What a choice little bit out of hell!" he exclaimed. "Mac, did you say they were our friends? God help us if they're not!"

"They are," said McGuire grimly. "Those are Althora's people who had forgotten how to fight; they are recapturing something that they lost some centuries ago. But can they ever destroy the rest of that swarm? I don't think they have the heart to do it."

"They do not need." It was Althora speaking. "My people are sickened with the slaughter. But the red ones will go back into the earth, and we will seal them in!—it is Djorn who tells me—and the world will be

ours forevermore."

A matter of two short days, crammed to the uttermost with the realization of the astounding turn of events—and McGuire and Althora stood with Blake and Djorn, the ruler, undisputed, of the beautiful world of Venus. A fleet of great ships was roaring high in air. One only, the flagship, was waiting where their little group stood.

The bodies of the fallen had been recovered; they were at rest now in the ships that waited above. McGuire looked about in final wonder at the sparkling city bathed in a flood of gold. A kindly city now—beautiful; the terrors it had held were fading from his mind. He turned to Althora.

"We are going home," he said softly, "you and I."

"Home?" Althora's voice was vibrant with dismay.

"We need you here, friend Mack Guire," the voice of Djorn broke in, in protest. "You have something that we lack—a force and vision—something we have lost."

"We will be back," the flyer assured him. "You befriended me: anything I can do in return—" The grip of his hand completed the sentence.

"But there is a grave to be made on the summit of Mount Lawson," he added quietly. "I think he would have preferred to lie there—at the end of his journey—and I must return to the service where I have not yet been mustered out."

"But you said—you were going home," faltered Althora. "Will that always be home to you, Tommy?"

"Home, my dear," he whispered in words that reached her only, "is just where you are." His arm went about her to draw her toward the waiting ship. "There or here—what matter? We will be content."

Her eyes were misty as they smiled an answer. Within the ship that was lifting them, they turned to watch a city of opal light grow faintly luminous in the distance ... an L-shaped continent shrunk to tiny size ... and the nebulous vapors of the cloudland that enclosed this world folded softly about.

"We will lead," the voice of Blake was saying to an aide: "same formation that we used coming over. Give the necessary orders. But," he added slowly to himself, "the line will be shorter; there are fewer of us now."

An astronomical officer laid a chart before the commander. "We are on the course, sir," he reported.

"Full speed," Blake gave the order, and the thundering generator answered from the stern. The Space Fleet of America was going home.

#57 The Destroyer, By William Merriam Rouse:

Slowly, insidiously, there stole over Allen Parker something uncanny. He could no longer control his hands—even his brain!

The pencil in the hand of Allen Parker refused to obey his will. A strange unseen force pushed his will aside and took possession of the pencil point so that what he drew was not his own. It was the same when he turned from drawing board to typewriter. The sentences were not of his framing; the ideas were utterly foreign to him. This was the first hint he received of the fate that was drawing in like night upon him and his beautiful wife.

Slowly, insidiously, there stole over Allen Parker something uncanny. He could no longer control his hands—even his brain!

Parker, a young writer of growing reputation who illustrated his own work, was making a series of pencil sketches for a romance partly finished. The story was as joyous and elusive as sunlight, and until to-day his sketches had held the same quality. Now he could not tap the reservoir from which he had taken the wind-blown hair and smiling eyes of Madelon, his heroine.

When he drew or wrote he seemed to be submerged in the dark waters of a measureless evil pit. The face that mocked him from the paper was stamped with a world-old knowledge of forbidden things.

Parker dropped his pencil and leaned back, tortured. He and his wife, Betty, had taken this house in Pine Hills, a small and extremely quiet suburban village, solely for the purpose of concentration on the book which was to be the most important work he had done. He went to the door of the room that he used for a studio and called:

"Betty! Can you come here a moment, please?"

There was a patter of running feet on the stairs and then a girl of twenty, or thereabout, came into the room. Any man would have said she was a blessing. Her hair "was yellow like ripe corn," and her vivid blue eyes held depth and character and charm.

"Look!" exclaimed Parker. "What do you think of this stuff?"

For a moment there was silence. Then Allen Parker saw something he had never before seen in his wife's face for him or his work—a look of complete disgust.

"I wouldn't have believed you capable of doing anything so ... so horrid!" she said coldly. "How could you?"

"I don't know!" His arms, which had been ready to take her to him for comfort, dropped. "The work has been ... difficult, lately. As though something were pulling at my mind. But not like this! It isn't *me*!"

"It must be you, since it came out of you!" She turned away and moved restlessly to one of the windows.

"Through me!" muttered Parker. "Ideas *come*!"

"You'll have to do something!"

"But what? I don't know what to do!"

"Why not go to see that new doctor?" asked Betty, over her shoulder. "Dr. Friedrich von Stein?"

"Von Stein?" repeated Parker, vaguely. "Don't know him. Anyhow, I don't need a doctor. What in the world made you think of that?"

"Nothing, except that I can see his house from here. He's taken what they call 'the old Reynolds place.' You know—opposite the church. We looked at it and thought it was too large for us. He's made a lot of alterations."

"Oh, yes!" Parker had placed the newcomer, more recent than himself. "I had an idea that he was a doctor of philosophy, not medicine."

"He has half a dozen degrees, they say. Certainly he's a stunning looking man. I saw him on the street."

"Maybe he doesn't practice." The artist was gazing, baffled and sick at heart, upon what he had wrought. "And what could he do, unless it's my liver?"

"He might be a psycho-analyst, or something like that," she replied, slowly.

"But why the wild interest in this particular doctor?" Parker roused himself and looked at her. He felt irritable, and was ashamed of it.

"Only for your work," said Betty. A faint pink touched her cheeks.

Allen Parker had a sudden feeling of certainty that his wife was lying to him. To one who knew the Parkers it would have been equally impossible to think of Betty as lying, or of her husband as believing such a thing. Parker was outraged by his own suspicion. He sprang up and began to pace the floor.

"All right, then!" he exploded. "My work is going to the dogs! Why, there's an appointment with Cartwright to-morrow to show him these sketches, and the last few chapters I've done! We'll go now! If this man can't do anything for me I'll try somebody else!"

In ten minutes they were walking up the quiet street toward the present home of Dr. Friedrich von Stein. Despite his self-absorption Parker could not help

noticing that his wife had never looked more attractive than she did at this moment. Her color had deepened, little wisps of hair curled against her cheeks, and there was a sparkle in her eyes which he knew came only on very particular occasions.

Even from the outside it was apparent that many strange things had been done to the staid and dignified house of Reynolds. A mass of aërials hung above the roof. Some new windows had been cut at the second floor and filled with glass of a peculiar reddish-purple tinge. A residence had been turned into a laboratory, in sharp contrast to the charming houses up and down the street and the church of gray stone that stood opposite.

Beside the door, at the main entrance, a modest plate bore the legend: "Dr. Friedrich von Stein." Parker pressed the bell. Then he squared his broad shoulders and waited: a very miserable, very likeable young man, with a finely shaped head and a good set of muscles under his well cut clothes. He had brought his sketches, but he was uncomfortable with the portfolio under his arm. It seemed to contaminate

him.

The door opened to reveal a blocky figure of a man in a workman's blouse and overalls. The fellow was pale of eye, towheaded; he appeared to be good natured but of little intelligence. The only remarkable thing about him was a livid welt that ran across one cheek, from nose to ear. Beside him a glossy-coated dachshund wagged furiously, after having barked once as a matter of duty.

"May we see Dr. von Stein?" asked Parker. "If he is in?"

"I will ask the Herr Doktor if he iss in," replied the man, stiffly.

"*Dummkopf!*" roared a voice from inside the house. An instant later man and dog shrank back along the hall and there appeared in their place one of the most striking personalities Allen Parker had ever seen.

Dr. Friedrich von Stein was inches more than six feet tall and he stood perfectly erect, with the

unmistakable carriage of a well drilled soldier. He was big boned, but lean, and every movement was made with military precision. More than any other feature his eyes impressed Parker: they were steady, penetrating, and absolutely black. But for a thread of gray here and there his well-kept beard and hair were black. He might have been any age from forty to sixty, so deceptive was his appearance.

"Come in, if you please," he said, before Parker could speak. Von Stein's voice was rich and deep, but with a metallic quality which somehow corresponded with his mechanical smile. Except for the guttural r's there was hardly a hint of the foreigner in his speech. "It is Mr. and Mrs. Parker, I believe? I am Dr. von Stein."

He stood aside for them to pass into the hallway, and while they murmured their thanks he shot a volley of German at the man, whom he called Heinrich. The frightened servant vanished; and the Parkers were taken into a living room furnished carelessly, but in good enough taste. Betty took her place on a couch, to which the doctor led her with a bow. Parker sank into an overstuffed chair not far from a window.

"I learned your names because of the beauty of madame," said Von Stein, as he stood looming above the mantel. Again he bowed. "One could not see her without wishing to know how such a charming woman was called. You are my neighbors from down the street, I believe."

"Yes," replied Allen. He wanted to be agreeable, but found it difficult. "And I think Mrs. Parker has developed a great admiration for you. She persuaded me to come here to-day. Are you, by chance, a psychoanalyst? I don't even know that you are a doctor of medicine, but—"

"I know a very great deal about the human mind," interrupted Dr. von Stein calmly. "I know a great deal about many things. I am not going to practice medicine here in Pine Hills because I have research work to do, but I will help you if I can. What is your trouble?"[201]

The question brought back to Parker the mood of half an hour ago. Almost savagely he snapped the portfolio open and spread out a few of his recent drawings,

with some of the earlier ones for comparison.

"Look!" he cried. "These vicious things are what I am doing now! I can't help myself! The pencil does not obey me! Apparently I have no emotional control. It's as though my normal ideas were shouldered aside, like people in a crowd. And my writing to-day was as bad as these illustrations. I'm doing a book. Consider these things carefully, Doctor. They are not obscene, except by inference. They can't be censored. The book would go through the mails. Yet they are deadly! Look at my heroine in these two pictures. In one she is like—like violets! In the other she looks capable of any crime! What is she? A vampire, if there is such a thing? A witch? I can almost believe in demonology since I made these last drawings!"

Parker, in spite of his excitement, tried to read the face of Dr. Friedrich von Stein. He found nothing but the automatic smile upon that mask. Yet it seemed to the artist that this time there was a hint of real pleasure in the curve of the lips. Was it possible that anyone could like those drawings? Parker began to think that he was going insane.

"This is most unfortunate for you," rumbled the doctor. "I understand. But I trust that the condition can be remedied, if it persists. You, Mr. Parker, and you, Madame, do you understand something of physics, of psychology, of metaphysics?"

"I fear that I'm rather ignorant," answered Betty. "Certainly I am in comparison with a man of your attainments."

Dr. von Stein bowed. He turned his black eyes upon Parker.

"And you, sir? I must adjust my explanation to—what shall I say? To your knowledge of the higher reaches of scientific thought?"

"Why, I majored in philosophy in college," said Parker, hesitatingly. "But that's quite a time ago, Herr Doktor. Of course I've tried to keep up with the conclusions of science. But a writer or a painter doesn't have any too much opportunity. He has his own problems to concern him."

"Yes, indeed!" Dr. von Stein was thoughtful. "So, and especially for the benefit of madame, I shall speak in terms of the concrete."

"Please consider me stupid!" begged Betty. "But I want to understand!"

"Certainly, except that you are not stupid, Madame. I will proceed. Both of you, I assume, know something of the radio? Very good! You know that an etheric wave transmits the message, and that it is received and amplified so that it is within the range of the human ear. These waves were there when paleolithic man hunted his meat with a stone-tipped club. To use them it was necessary to invent the microphone, and a receiving instrument.

"What I have said you already know. But here is what may startle you. Human thought is an etheric wave of the same essential nature as the radio wave. They are both electrical currents external to man. Thoughts sweep across the human mind as sound currents sweep across the aerials of a radio—"

"I told you!" Allen Parker turned a triumphant face to his wife. "Pardon me, Herr Doktor! I have tried to convince Mrs. Parker that my idea came from outside!"

"Exactly!" Dr. von Stein took no offense. "And a difference between the mind and the radio set is that with the radio you tune in upon whatever you choose, and when you choose. The mind is not under such control, although it should be. It receives that to which it happens to be open. Or that thought which has been²⁰² intensified and strengthened by having been received and entertained by other minds. In India they say: 'Five thousand died of the plague and fifty thousand died of fear.' Do you both follow me?"

It was unnecessary to ask. Betty sat on the edge of the couch, intent upon every word. Parker, although more restrained, was equally interested. Moreover he was delighted to have what he had felt instinctively confirmed, in a way, by a man of science.

"Herbert Spencer said," continued the doctor, "that no thought, no feeling, is ever manifested save as the

result of a physical force. This principle will before long be a scientific commonplace. And Huxley predicted that we would arrive at a mechanical equivalent of consciousness. But I will not attempt to bolster my position with authorities. I know, and I can prove what I know.

"You, Mr. Parker, have been receiving some particularly annoying thoughts which have been intensified, it may be, by others, or another. Human will power can alter the rate of vibration of the line of force, or etheric wave. So-called good thoughts have a high rate of vibration, and those which are called bad ordinarily have a low rate. Have you, perhaps, an enemy?"

"Not that I know of," replied Parker, in a low voice.

"Then it would follow that this is accidental."

"Good heavens! Do you mean to say that someone could do this to me maliciously?"

"So far my experiments leave something to be

desired," said Dr. von Stein, without answering directly. "No doubt you are peculiarly susceptible to thoughts which bear in any way on your work."

"But isn't there any help for it?" asked Betty. She was regarding her husband with the eyes of a stranger.

"I believe I can do something for Mr. Parker."

There was a knock at the door. The doctor boomed an order to come in. Heinrich, with the dachshund at his heels, entered bearing a tray with a bottle of wine and some slices of heavy fruit cake. He drew out a table and placed the tray.

"Do not bring that dog in when I have guests," said Von Stein. He spoke with a gleam of white teeth. "You know what will happen, Heinrich?"

"*Ja*, Herr Doktor! I take Hans out!" The man was terrified. He gathered the dog into his arms and fairly fled from the room. Dr. von Stein turned with a smile.

"I have to discipline him," he explained. "He's a stupid

fellow, but faithful. I can't have ordinary servants about. There are scientific men who would be willing to bribe them for a look at my laboratory."

"I did not know such things were done among scholars," said Betty, slowly.

"What I have accomplished means power, Madame!" exclaimed the doctor. "There are jackals in every walk of life. If an unscrupulous man of science got into my laboratory, a physicist for instance, he might ... find out things!"

Dr. von Stein turned to his duties as host. He filled their glasses, and watched with satisfaction Betty's obvious enjoyment of the cake. A box of mellow Havanas appeared from a cabinet: imported cigarettes from a smoking stand. But Parker, in spite of a liking for good wine and tobacco, was far too much concerned about his work to forget the errand that had brought him there.

"So you think," he said, when there was opportunity, "that you can help me, Dr. von Stein?"

"I can," replied von Stein, firmly; "but before attempting anything I'd like to wait a day or two. The attacking thoughts may become less violent, or your resistance greater, in either of which cases the condition will fade[203] out. You will either get better or much worse. If you are worse come to see me again, and I promise you that I will do something!"

"I'll come, and thank you!" Parker felt better, and more cheerful than he had since the beginning of the disturbance. "Few things could make me suffer so much as trouble with my work."

"That is what I thought," agreed Dr. von Stein.

Betty rose. Her husband caught the look in her eyes as they met the bright, black gaze of Dr. von Stein, and he went cold. That look had always been for him alone. Her feet seemed to linger on the way to the door.

"He's wonderful!" she breathed, as they started down the uneventful street. "Scientific things never interested me before. But he makes them vital,

living!"

"And yet," said Parker, thoughtfully, "there's something uncanny about that man!"

"Nonsense!" exclaimed Betty. "It's because he's a genius! Don't be small, Allen!"

Parker gasped, and remained silent. He could not remember that his wife had ever spoken to him in quite that way. They finished the little journey home without speaking again and Parker went directly to studio. He sat down, with drooping shoulders, and considered the mess he had made of his book. Well, there was nothing to do but see Cartwright to-morrow and face the music!

Dinner that night was a mournful affair. The soft footsteps of the servant going in and out of the dining room, the ticking of the clock, were almost the only sounds. Betty was deep in her own thoughts; Parker was too miserable to talk. He went to bed early and lay staring into the darkness for what seemed like an eternity of slow moving hours.

The tall, deep voiced clock in the hall downstairs had just struck one when suddenly Parker's room was flooded with light. He sat up, blinking, and saw Betty standing near his bed. Her fingers twisted against each other; her face was drawn and white.

"Allen!" she whispered. "I'm afraid!"

Instantly he was on his feet; his arms went around her and the yellow head dropped wearily against his shoulder.

"Afraid of what?" he cried. "What is it, sweetheart?"

"I don't know!" All at once her body stiffened and she pulled away from him. Then she laughed—"What nonsense! I must have been having a bad dream ... it's nothing. Sorry I bothered you, Allen!"

She was gone before his could stop her. Bewildered, he did not know whether to follow. Better not, he thought. She would sleep now, and perhaps he would. But he was worried. Betty was becoming less and less like herself.

At last Parker did sleep, to awake shortly after daylight. He got a hasty breakfast and took an early train to New York. When John Cartwright, a shrewd and kindly man well advanced in years, arrived at his office Allen Parker was right there waiting for him.

Cartwright had shown a real affection for the younger man, a paternal interest. He beamed, as usual, until he sat down with the new drawings. Slowly the smile faded from his face. He went over them twice, three times, and then he looked up.

"My boy," he said, "did you do these?"

"Yes."

"Do you know that you are turning a delicate and beautiful romance into a lascivious libel on the human race?"

"It is being done," replied Parker, in a low voice. "And I—I can't help myself!"

"What do you mean by that?"

"I mean that when I start to draw[204] Madelon my hand produces that woman of Babylon! The writing is just as bad. It's full of sneering hints, double meanings ... I shall destroy the stuff. I've been to see a psycho-analyst."

"Ah!" thoughtfully. "Perhaps you're tired, Allen. Why not take Betty for a sea trip? There'll still be time for fall publication."

"I'm going to try everything possible. I'd rather be dead than do work like this!"

When Parker left his friend he was somewhat encouraged. After the first shock Cartwright had been inclined to make light of the difficulty, and by the time Allen Parker reached Pine Hills his stride had the usual swing and snap.

He ran up the steps of his house and burst into the living room with a smile. Betty was sitting by one of the windows, her hands lying relaxed in her lap. She turned a somber face toward her husband, and spoke before he had time to say a word of greeting.

"You knew that Cordelia Lyman died a short time ago, didn't you?"

"What's that?" exclaimed Parker, bewildered. "Lyman? Oh, the old lady down the street who left her money to found a home for aged spinsters? What about it?"

"But she didn't leave her money to found a home for aged spinsters, Allen. She had said she was going to, and everybody thought so. Her will was admitted to probate, or whatever they call it, yesterday. She left half a million, all she had, to Dr. Friedrich von Stein, to be used as he thinks best for the advancement of science!"

"Good heavens!" Parker stared. "Why, I didn't know she knew him. He'd only been here a week or so when she died."

"There isn't a flaw in the will, they say. You can imagine that Pine Hills is talking!"

"Well," said Parker philosophically, "he's lucky. I hope he does something with it."

"He will," replied Betty, with conviction. "He'll do a great many things!"

Parker told her of his interview with Cartwright, but she seemed little interested. He did not try to work that day but, after he had put the offending drawings and manuscript out of sight, he wandered, read, smoked, and in the evening persuaded Betty to take a moonlight walk with him.

They passed the house of Dr. von Stein, from which came a faint humming that sounded like a dynamo. Across the street the church was alight for some service. Triumphant music drifted to them. The moon hung above the spire, with its cross outlined darkly against the brilliant sky. The windows were great jewels. Betty drew a deep breath.

"Sometimes, Allen," she said, "I feel like praying!"

"You *are* a beautiful prayer," whispered Parker.

She walked close to him, holding his arm, and repeated softly:

"Are not two prayers a perfect strength? And shall I feel afraid?"

But that was the end of that mood. By the time they arrived home Betty was again the strange, aloof, cold, slightly hard woman of the past few days. Again depression settled upon Allen Parker.

The next morning he breakfasted alone and went directly to the studio, without seeing Betty. Sun streamed into the room; the pencil moved swiftly. For a brief time Parker thought that he was himself again, as Madelon grew upon the block of paper. But the end was terrible. The last few strokes made her grotesque. This time the woman he had drawn was not merely evil; she was a mocking parody of his heroine. He threw drawing and pencil across the room.

But no real artist can be discouraged[205] short of death. He went to work again and labored until luncheon time. The results were no better, although they varied. Now it seemed that some malevolent power was playing with him, torturing him to the

accompaniment of devilish laughter. He was haggard and actually stooped of body when he bathed his face and went down to the dining room. From across the table Betty regarded him curiously.

"Fleming Proctor shot himself last night," she announced, calmly. "This morning they found him dead in his office."

"Proctor? You don't mean the president of the Pine Hills National Bank?"

"Yes." The expression of Betty's face did not change. "There was a note saying that he was sorry. It seems he'd made a large loan without security to an unknown person, and the bank examiner was coming to-day. Proctor said he couldn't help what he did. The note was confused as though he were trying to tell something and couldn't. They think his mind must have given way, particularly as they can't trace the loan, although the money is undoubtedly gone."

"That kind of thing doesn't happen!" Parker was stunned. He had known Fleming Proctor, and liked

him. They met often at the country club. "Proctor was honest, and a fine business man!"

"It did happen, Allen!"

"I'd like to know more about it. That would have been a case for Dr. von Stein to take in hand."

"Perhaps," said Betty, in a voice like ice. "But I'm more interested in finding out how soon you are going to return to normal. Frankly, I'm beginning to get bored."

Without a word Parker rose and left the room. Never before had his wife hurt him like this. Doubly sensitive just now, he was suffering alone in the studio when the telephone rang.

"Dr. von Stein speaking. Are you better, Mr. Parker?"

"Worse! Much worse!"

"Then come to my house this evening at nine. May I expect you? And alone?"

"Yes." There was much Parker wanted to say, but he choked the words back. "I'll be there, and alone."

"I shall be ready for you. Good-by."

Allen Parker hung up the receiver. He did not leave the studio again until evening.

As Parker approached the house of Dr. Friedrich von Stein he saw that the church was lighted as it had been the night before. In a clear sky the moon rode above the spire. He paused to let his glance sweep up along the beautiful line that ran from earth to the slender cross. That was how he felt. He wanted to rise, as that line rose, from cumbering earth to clarity and beauty.

He mounted the steps and rang. Dr. von Stein met him, with eyes and teeth agleam in the hall light. Wearily Parker stepped inside. His mood of the moment before was fading.

"Go upstairs to my laboratory, if you please," said the doctor. "It is best that I see you there, for it may be

that you will need treatment."

"I need something," replied Parker as he went up a long flight of stairs. "I'm in a bad way."

Without answer von Stein led him down a short corridor and held open a door. Allen Parker stepped into a room that bewildered him with its strange contrasts.

At a glance he saw that nearly the whole upper floor of the building had been converted into one gigantic room. Near a big stone fireplace, where burning driftwood sent up its many tinted flames, Heinrich stood rigidly at attention. Hans, the dachshund, crouched at his feet. When the dog started to meet Parker a guttural command stopped him.

Here there were bearskins on the floor, huge stuffed chairs, footrests, little tables, humidors, pipe racks, all that[206] one could desire for comfort. Two German duelling swords were crossed above the mantel.

But beyond this corner everything was different. Parker saw the massed windows of reddish-purple glass; he saw apparatus for which he had no name, as well as some of the ordinary paraphernalia of the chemical laboratory. There was wiring everywhere, and a multitude of lighting fixtures. Utilitarian tables, desks and chairs were placed about with mathematical precision. There were plates and strips of metal set into the glass smooth flooring, which was broken by depressions and elevations of unusual form.

The most striking thing in the room was a huge copper bowl that hung inverted from the ceiling. In it, and extending down below the rim, was what seemed to be a thick and stationary mist. It looked as though the bowl had been filled with a silver gray mist and then turned bottom side up. But the cloud did not fall or float away.

"I can think and speak best from my desk," Von Stein was saying. "Please sit down facing me in the chair which Heinrich will place for you. Then we will talk."

Heinrich rolled one of the overstuffed chairs noiselessly to a position about six feet from the desk. Parker noticed a long metal strip in the floor between him and the doctor.

Just then Hans wriggled forward and the artist scratched his ears, to be rewarded by a grateful tongue. Again a command from Heinrich brought the dog to heel, but the voice was not so gruff this time. Together they returned to the fireplace.

Von Stein let his hands rest upon the desk top—a surface covered with levers, electric switches, push buttons, and contrivances the nature of which Parker could not guess. The doctor leaned forward. He threw over a switch. The lights in the room became less bright. He pressed a button. The *Danse Macabre* of Saint-Saens floated weirdly upon the air, as though the music came from afar off.

"Is that part of the treatment?" asked Parker, with a faint smile. "It's not cheering, exactly."

"Merely an idiosyncrasy of mine," answered Von

Stein, showing his teeth. "Before anything is done I must, in order to aid the receptivity of your mind, go a little further with the explanation of certain things which I mentioned the other day. I promise not to bore you. More than that, Mr. Parker, I promise that you will be more interested than you have ever been in anything!"

It seemed to Parker that there was something sinister in the manner and speech of Dr. von Stein. The Dance of Death! Did that music have a meaning? Impossible! It was only his own sick mind that was allowing such thoughts to come to him.

"Anything that will help," he murmured.

"You have noticed that copper bowl?" Von Stein did not wait for a reply. "The misty appearance inside and underneath it is given by thousands upon thousands of minute platinum wires. When it is in use a slight electrical current is passed through it, varying in power according to the rate of vibration needed. That instrument, my dear sir, is a transmitter of thought. I may call it the microphone of the mind. I can tune in

on any mind in the world, by experimenting up and down the vibration range to determine the susceptibility of the particular person. The human mind does not need an amplifier, as the radio receiving set does. Rather, it acts as its own amplifier, once having received the thought. I invented one, however, to prove that it could be done. I equipped Heinrich with it and in half an hour by suggestion reduced him to his present state of docile stupidity. I have, Mr. Parker, the means of moving people to do my bidding!"[207]

Von Stein stopped abruptly, as though for emphasis and to allow his astounding statements to take effect. Parker sat stunned, struggling to grasp all the implications of what he had just heard. Suddenly they became clear. He saw events in order, and in relation to each other.

"So that's how it was with Cordelia Lyman!" he cried hoarsely, leaning forward. "And it was you who had that money from Fleming Proctor!"

"You are not unintelligent," remarked Dr. von Stein.

"Better that science should have the Lyman money than a few old women of no particular use. As for Proctor, he was a fool. I would have protected him."

"And my pictures ... my book...."

"I can cure you, Mr. Parker. *If I will!*"

"And anyone is at the mercy of this man!" groaned Parker.

"Not absolutely, I'm sorry to say," said the doctor.

"The action of thought on the human consciousness is exactly like that of sound on the tuning fork. When the mind is tuned right, we'll say for illustration, the lower vibrations are not picked out of the ether. But as few minds are tuned right, and as all vary from time to time, I'm practically omnipotent."

"You have changed the nature of my wife!" Parker was getting hold of himself and he could speak with a degree of calmness. "That is a worse crime than the one you've committed against me directly!"

"Mr. Parker," said the doctor, impressively, "you are in a web. I am the spider. You are the fly. I don't particularly desire to hurt you, but I want your wife. This is the crux of the matter. She is the woman to share my triumphs. Already I have aroused her interest. Give her up and you will continue your work as before. Refuse, and you will lose her just as certainly as though you give her to me. For, my dear sir, you will be insane in less than a month from now. I promise you that!"

Allen Parker was not one to indulge in melodrama. For a long moment he sat looking into the black eyes of Von Stein. Then he spoke carefully.

"If my wife of her own will loved you, and wanted freedom, I'd let her go. But this is a kind of hypnosis. It's diabolical!"

"Who but the devil was the father of magic?" asked the doctor, cheerfully. "Hypnosis is unconsciously based on a scientific principle which I have mastered. Repeated advertising of a tooth brush or a box of crackers is mild mental suggestion—hypnosis, if you

will. My dear fellow, be sensible!"

"Sophistry!" growled Parker.

Von Stein laughed. He moved a lever upon a dial and a sheet of blue flame quivered between them. With another movement of the lever it vanished.

"I could destroy you instantly," he said, "and completely, and no one could prove a crime! I shall not do it. I have no time to be bothered with investigations. Think of the fate I have promised you. Think, and you will give her up!"

"I shall not!" Parker wiped cold drops from his forehead. The doctor frowned thoughtfully.

"I'll intensify her desire to come here to-night," he said. "She herself will persuade you."

Parker set his fingers into the arms of his chair as Von Stein rose and walked to the copper bowl. He stood directly under it, and put on goggles with shields fitting close to his feet. At the pressure of his foot a

tablelike affair rose from the floor in front of him. This, like the desk, was equipped with numerous dials, buttons and levers. Von Stein manipulated them. The great cap of copper descended until his head was enveloped by the mist of platinum wires. A faint humming grew in the room. A tiny bell tinkled.

"The connection is made," murmured[208] Von Stein. He lifted a hand for silence: then his fingers leaped among the gadgets on the table. After that came a brief period, measured by seconds, of immobility. Then the table sank from view, the copper bowl lifted, and Dr. von Stein went back to his chair.

"She will be here shortly," he said. "If that does not change your mind...."

He shrugged. Parker knew what that shrug meant. He searched his mind for a plan and found none. Better die fighting than yield, or risk the vengeance of Friedrich von Stein. If he could get the doctor away from the desk where he controlled the blue-white flame there might be a chance to do something. Von Stein was by far the larger man, but Parker had been

an athlete all his life. If....

"That mass of copper and platinum," he said, tentatively, "will make you master of the world!"

"My brain, my intelligence, has made me master of the world!" corrected Von Stein, proudly. He was touched in the right spot now. "You have not seen all!"

He sprang up and went to one of the tables. From his pocket he took a piece of paper and crumpled it into a ball while, with the other hand, he made some electrical connections to a plate of metal set into the surface of the table. Next he placed the wad of paper on the plate. Then, standing at arm's length from the apparatus, he pressed a button. Instantly the paper disappeared behind a screen of the colors of the spectrum, from red to violet. The banded colors were there for a minute fraction of a second. Then there was nothing where the paper had been on the plate. Von Stein smiled as he stepped away from the table.

"The electron is formed by the crossing of two lines of force," he said, "and the interaction of positive and

negative polarity. The electron is a stress in the ether, nothing more, but it is the stuff of which all matter is made. Thought is vibration in one dimension; matter in two. You have just seen me untie the knot, dissociate the electrons, or what you will. In plain language I have caused matter to vanish utterly. That paper is not burned up. It no longer exists in any form. The earth upon which we stand, Parker, can be dissolved like mist before the sun!"

Appalled as he was at this man who boasted and made good his terrible boasts Allen Parker had not forgotten the purpose that was in him. Now was his chance, while Von Stein stood smiling triumphantly between table and desk.

Parker shot from his chair with the speed of utter desperation. He feinted, and drove a vicious uppercut to the jaw of Dr. Friedrich von Stein. The doctor reeled but he did not go down. His fists swung. Parker found him no boxer, and beat a tattoo upon his middle. Von Stein began to slump.

Then two thick muscled arms closed around the artist

from behind and he was lifted clear of the floor. He kicked, and tried to turn, but it was useless. The doctor recovered himself. His eyes blazed fury.

"Put him in the chair, Heinrich!" he roared. "For this I will show you what I can do, Herr Parker!"

At that instant little Hans, who had been yelping on the edge of the battle, dashed in. He leaped for the throat of Von Stein. The doctor kicked him brutally.

The shriek of agony from Hans loosened the arms of Heinrich. Parker got his footing again. He saw the clumsy serving man spring forward and gather his dog up to his breast. Again Parker rushed for his enemy.

It was clear now that Von Stein was cut off from the controls he wanted, and without Heinrich he could not master Parker in a fight. For an instant he stood baffled. Then he retreated the length of the room, taking what blows he could not beat off. He staggered upon a plate of metal set into the floor, righted himself, and failed in an attempt to catch hold of

Parker. Suddenly he bowed in the direction of the distant doorway.

Allen half turned. Betty was coming down the room, staring and breathless.

"*Leben sie wohl!*" cried Von Stein. "Farewell, Madame! I should like to take you with me!"[209]

A great flash of the colors of the spectrum sent Parker reeling back. Dr. Friedrich von Stein had gone the way of the crumpled ball of paper.

There was a long moment of silence. Then Allen Parker found his wife in his arms, clinging to him.

"Are not two prayers a perfect strength?" she murmured, sobbing against his heart.

#58 The Gray Plague, By Lloyd Arthur Eshbach:

Maimed and captive, in the depths of an interplanetary meteor-craft, lay the only possible savior of plague-ridden earth.

Chapter 1

Five months before the beginning of that period of madness, that time of chaos and death that became known as the Gray Plague, the first of the strange meteors fell to Earth. It landed a few miles west of El Paso, Texas, on the morning of March 11th.

Maimed and captive, in the depths of an interplanetary meteor-craft, lay the only possible savior of plague-ridden Earth.

In a few hours a great throng of people gathered around the dully smoldering mass of fire-pitted rock, the upper half of which protruded from the Earth where it had buried itself, like a huge, roughly outlined hemisphere. And then, when the crowd had assumed its greatest proportions, the meteor, with a mighty, Earth-shaking roar, exploded.

A vast flood of radiance, more brilliant than the light of the sun, lit up the sky for miles around. One moment, a throng of curious people, a number of scientists, newspaper men—a crashing explosion—

and then a great, yawning pit sending forth a blinding radiance! Destruction and death where life had been.

The brilliant light streamed from the pit for about ten minutes; then like a snuffed-out candle flame, it vanished.

The second of the strange meteors landed on the evening of March 13th, in the city of Peking, China. It demolished several buildings, and buried itself beneath the ruins. The Chinese, unaware of the tragedy at El Paso, gathered in the vicinity, and when the meteor exploded at about ten o'clock that night, were instantly destroyed. As in Texas, the great pit emitted a cloud of dazzling light for about ten minutes, throwing a brilliant glow over the city and its surroundings; then was extinguished.

The people of the world awoke to the fact that events worthy of more than passing interest were occurring. The press of every nation began giving the strange meteors more and more publicity. Statements of different pseudo-scientists were published in explanation of the meteor's origin, statements that

aroused world wide conjecture.

Approximately twenty-four hours after the falling of the second missile, the third one fell, landing near Madrid, Spain. The Spaniards, having received news of the El Paso and Peking tragedies, avoided the ugly mass of rock as though it were a dreaded pestilence. In every way its action was similar to that of its two predecessors.

The interest of the world was doubled now. The unusual similarity of the action of the meteors, and the regularity of their landings, seemed indicative of a definite, hostile purpose behind it all. A menace from the unknown—a peril from the skies!

Scientists began giving serious consideration to the unusual phenomenon, pottering around in the pits, wearing airs of puzzlement. But their investigations were of no avail, for nothing of any great significance came to light through their efforts.

At about that time, an announcement was made that created a furor. Astronomers in different parts of the

United States reported that they had observed a bright flare of light leaping up from the darkened portion of the planet Venus. The astronomers had no definite idea of anything of importance in back of what they had seen; but not so the masses. The flare, they said, was caused by the release of another meteor!

From Venus! Missiles, hurled by Venerians, menacing the Earth! The silver planet became the subject of universal discussion; innumerable fantastic articles about it appeared in magazine sections of Sunday newspapers. And the astronomers of Earth turned their telescopes toward Venus with an interest they had never felt before.

Four days of expectant waiting passed by after the third meteor had fallen, while interest continued mounting at an accelerating pace. And then, at about two o'clock in the morning of the 18th, three great observatories, two in North America and one in England, recorded the falling of an extraordinarily large and unusually brilliant meteor that glowed with an intense, bluish-white light as it entered the Earth's

atmosphere. And, unlike most meteors, this one was not consumed by its intense heat, but continued gleaming brilliantly until it vanished below the horizon. Simultaneous with the falling of the meteor, the Earth was rocked by one of the worst quakes in history.

Seismographs in all parts of the world recorded the tremors of the Earth, each indicating that the disturbance had occurred somewhere beneath the Atlantic ocean. Evidently the fourth meteor had fallen into the ocean, for the shaking of the Earth was obviously the result of the collision. That quakes had not followed the landing of the first three was due to the fact that they had been far smaller than the fourth.

And then, a short time after the earthquake, the worst storm in two hundred years broke over the Atlantic. Waves, mountain high, piled themselves upon each other in a wild frenzy; a shrieking wind lashed the waters into a liquid chaos. Great ocean-liners were tossed about like tiny chips; an appalling number of smaller ships were lost in that insane storm.

Nor was the destruction confined to the sea, for all along the Atlantic coast of North America and Europe, mighty walls of water rushed in, and wrecked entire towns and cities.

Fortunately the storm was of short duration; a few hours after it began, it subsided.

For a number of weeks public attention was centered upon the meteors and storm; but gradually, when nothing further occurred, the fickle interest of the masses began to wane. A month after the storm, the strange meteors were no longer mentioned by the press, and consequently, had passed from the public mind. Only the astronomers remembered, keeping their telescopes trained on Venus night after night.

Four months passed by during which nothing of an unusual nature came to the attention of the world. But at the end of that time, it suddenly dawned upon those nations whose shores touched the Atlantic ocean, that something extraordinary was happening. It was taking place so insidiously, so quietly, that it had attracted no great attention.

A series of inexplicable sea disasters had begun. Every ship that had traveled over a certain, regular steamship route, had disappeared, leaving no trace. Mysteriously, without warning, they had vanished; without a single S O S being sent, seven freighters had been lost. The disappearances had been called to the world's attention by the shipping companies, alarmed at the gradual loss of their boats.

Then other mysterious vanishings came to the attention of the world. Ships in all parts of the Atlantic were being lost. When this fact became known, trans-Atlantic commerce ceased almost overnight. With the exception of a few privately owned yachts and freighters, the Atlantic became deserted.

And finally, a few days after the world became aware of the strange disappearances on the Atlantic, the Gray Plague introduced itself to humanity. Attempts were made to repress the facts: but the tragedy of the freighter, *Charleston*, in all its ghastriness and horror, became known in spite of all attempts at secrecy.

On the morning of August 3rd, the *Charleston* was

found, half buried in the sand of a beach on the coast of Florida, cast there, evidently, by a passing storm. The freighter had been one of the first boats to disappear.

When the ship's discoverers boarded her, their eyes were greeted by a sight whose ghastliness filled them with a numbing horror. Indeed, so terrifying was the spectacle on the *Charleston*, that the discoverers, four boys of adolescent age, left in fear-stricken haste. Nor could they be induced to return to the ship's deck.

Later, a group of men from a nearby town boarded the freighter to investigate the boys' amazing report. In the group was a newspaper reporter who chanced to be in the vicinity on a minor story. It was through the reporter's account that the facts became known as quickly as they did.

When the men clambered up the side of the *Charleston* to her deck, they saw a spectacle the like of which had never before been seen on Earth. Although they had been prepared for the horror to

some extent by the story of the boys, the sight on the *Charleston* exceeded their description to such a degree that, for the moment, the men were rendered speechless.

The deck of the *Charleston* was a shambles—a scene of sudden, chilling death. All about were strewn gray, lifeless bodies. Death had overtaken the crew in the midst of their duties, suddenly, without warning, it seemed. Bodies strewn about—yet nowhere was there sign of decay! Bodies, lifeless for days, or weeks—yet intact!

The men were fearfully impressed by the strangely grotesque positions of the corpses. With a few exceptions, they lay on the deck in abnormal, twisted masses of gray covered flesh. Somehow, they seemed flattened, as though they had been soft, jellylike, and had flowed, had settled, flat against the deck. Some were no more than three inches thick, and had spread out to such an extent that they looked like fantastic caricatures of human bodies. That unnatural change in their structure, and the ghastly, dead-gray color of their skins gave the corpses a horrifying, utterly

repulsive appearance that made the flesh of the men crawl.

The bodies had a strangely soft aspect, as though they were still jellylike. One of the men, bolder than the rest, touched a body—and withdrew his hand in revulsion and surprise. For the ugly mass was cold, and as hard as bone: the tissues of the flesh seemingly replaced by a solid, bony substance. Later investigation revealed that all the dead on the *Charleston* had assumed a similar, bonelike solidity.

When the men left the freighter to report the tragedy to the proper authorities, their faces were blanched, and their nerves badly shaken. Yet their horror was nothing when compared with what it would have been, had they known what was to follow.

Rapidly the story of the *Charleston* spread. By means of the press, over the radio, even by word of mouth, the story of the horror on the freighter was given publicity. All over the United States and Canada it spread, and from thence to the rest of the world. Eagerly was the story accepted: here, at last, was the

explanation of the sea disasters! And then, more than ever before, was the Atlantic ocean shunned.

The bodies of the seamen on the freighter were turned over to scientists for experimentation and research. It was thought that they might be able to discover the cause of the Gray Death, and with a knowledge of its cause, create something with which to free the Atlantic from its scourge.

The scientists' investigations only served to mystify the world to a greater degree. The only thing that came to light was the cause of the bodies' bonelike rigidity. In some inexplicable way the bones in the seamen had dissolved, and according to appearances, while the bodies were plastic, had flattened out. And then, strange and unnatural though it seemed, the calcium from the dissolved bones had gathered at the surface of each body, and combining with the flesh and skin, had formed the hard, bony shell that gave them their ghastly grayness, and their appearance of petrification. Aside from this, the scientists learned nothing; the cause of this amazing phenomenon was a complete mystery to them.

Slowly, methodically, step by step, the unusual had been taking place. From the time of the landing of the first strange meteor, up to the discovery of the *Charleston*, there had been a gradual increase in the significance of each succeeding event.

Then finally came the climax: the Gray Plague itself. All that preceded it faded into significance before the horror of the dread pestilence that seized the world with its destroying talons.

A short time after the discovery of the *Charleston*, the Plague made its first appearance on land. Slowly, pitilessly, inexorably, it began, taking its toll all along the Atlantic coast. From Newfoundland to Brazil; from the British Isles to Egypt, wherever people lived near the ocean, thousands were stricken with the dread malady.

The old and infirm were the most quickly affected; their weakened bodies could not withstand the ravage of the Plague as could those of younger people. An old man, walking along a large thoroughfare in Savannah, Georgia, suddenly uttered a fearful shriek and sank to

the pavement. While the pedestrians watched with bulging eyes, he seemed to shrink, to flatten, to flow liquidly, turning a ghastly gray. Within an hour he was as hard as the men of the *Charleston*. Of all the millions, perhaps he was the first.

Others followed in the wake of the first victim, young as well as old; three hours after the death in Savannah, every channel of communication was choked with news of a constantly increasing number of casualties. A Boston minister, preaching a funeral sermon, collapsing beside the coffin; a lineman on a telegraph pole, overcome, falling—and splashing! A thousand incongruous tragedies shocking humanity.

In Europe the action of the Plague was the same as in North America. Death stalking the sea-coast, destroying thousands; ignorant fishermen, men of learning, women and children of every age—all were grist to be ground in the mill of the Gray Plague.

Before a week had gone by, no one remained alive in the villages, towns and cities all along the Atlantic. New York, London, all the large coast cities were

deserted by the living, left to the rigid dead. From the largest metropolis to the smallest hamlet, all became body-glutted tombs.

And then, on the morning of October 12th, news was given to the world that threw mankind into a panic. The Plague was moving inland! Slowly, yet relentlessly it spread, no longer confining its effect to the sea-coast, but moving farther and farther inland toward the heart of the two continents, driving mankind before it. For people fled in insane terror before the advancing death. Nor was there escape from the menace—no antidote to counteract, no sanctuary wherein to hide.

To North and South, to East and West, the pestilence spread, destroying as it went. Unless there were some miraculous intervention, the human race would be destroyed!

Officials of the world were at their wits' end; scientists threw up their hands in despair. The Plague was an insoluble puzzle—enigmatical, utterly inexplicable, beyond the knowledge of Earth.

Scientists and doctors were brutally slain during that period by fear-crazed mobs, because of their inability to rescue the world from the grip of the Plague. Thousands of people died while striving to escape from the Gray Death, crushed by passing motor vehicles, or starving in the congested areas. Gone was the boasted civilization of man—humanity sinking rapidly to the level of the beast; gone, destroyed in a few weeks!

And then one day when the end seemed perilously close, there was ushered into the presence of the remnant of the United States officials who had gathered in San Francisco, a twisted monstrosity of a man, fearfully scarred and deformed. He was closeted with them for two hours. At the end of that time an excited official communicated with the leader of the American scientists.

"A cure for the Plague has been discovered!" he cried in joyful tones. "Man still has a chance!"

Before an hour had passed by, scientists were in possession of cultures of germs that would destroy

the bacilli of the Gray Death. The hope of salvation restored some semblance of order; and in a very short time the development of the germs was going forward as rapidly as skilled bacteriologists could carry it. Forces of doctors were marshalled to administer the cure, inoculating all who were untouched by the Plague.

At about that time, a small, bronze-colored sphere arose into the air above San Francisco, and sped eastward with amazing velocity. It flashed over the United States, over the Atlantic ocean, and over western Europe, finally landing in the midst of the European hordes. There its operator, a deformed cripple, left bacteria similar to those he had given to the United States.

In a short time Europe, too, was busily engaged in developing the bacteria, and inoculating her people.

Many others died before the world was rendered immune, but at last mankind let its labors cease. The Gray Plague was overcome.

Then the work of reclaiming the deserted areas was begun; then, too, was started the ghastly task of disposing of the countless, rigid dead. And finally, a great steamer left New York harbor, and started across the Atlantic. It was the purpose of the men on board to destroy utterly the source of the Plague.

But long before that occurred, humanity had heard the story of Phillip Parkinson, the man who saved the world—had heard, and had honored the deliverer of mankind.

Parkinson's story follows:

Chapter 2

The steam yacht, Diana, bound for the Azores and points south, was two days out from Miami when the great meteor fell into the Atlantic. On the after deck, leaning over the rail, watching the moonlit waters, stood Phillip Parkinson, owner of the yacht. A bacteriologist of international fame was Parkinson, on an early vacation to recuperate from the effects of a strenuous winter of research. Nervous, rather high-strung, he had been unable to sleep; at about one in the morning of the 18th of March, he had come up on deck.

He had stood there for about an hour when suddenly there appeared in the sky above him, a meteor, a great disc of blue-white incandescence. It seemed to be rushing straight down toward him; instinctively he leaped back, as though to avoid the fiery missile.

As the constantly expanding disc flashed through the hundred miles of Earth's atmosphere, the ocean, as far as eye could see, became as light as day. Bathed in that baleful, white glare, Parkinson, bewildered,

dazed, half-blinded, watched the approaching stellar visitant.

In a few moments it struck—no more than two miles away. In the last, bright flare of blue-white light, Parkinson saw a gigantic column of steam and boiling water leap up from the sea. Then thick, impenetrable darkness fell—darkness that was intensified by its contrast with the meteor's blinding light.

For ten tense, breathless seconds utter silence hung over the sea ... then, for those on the yacht, the world went mad! A shrill, unearthly shriek—the sound of the meteor's passage through the atmosphere; an ear-splitting roar, as of the simultaneous release of the thunder-drums of ages; a howling demon of wind; a solid wall of raging, swirling water of immeasurable height—all united in an indescribable chaos that bewildered those on board the Diana, and that lifted the yacht and—threw it upon its side!

When the first rushing mountain of lathering, thundering water crashed upon the yacht, Parkinson felt himself hurtling through the roaring air. For a

moment he heard the infernal pandemonium of noise ... then the strangling, irresistible brine closed over his head.

A blackness deeper than that of the night—and Parkinson knew no more....

Slowly consciousness returned to the bacteriologist. It came under the guise of a dull, yet penetrating throbbing coming from beneath the surface on which he lay. Vaguely he wondered at it; he had not yet entirely cast off the enshrouding stupor that gripped him.

Gradually he came into full possession of his faculties—and became aware of a dull aching throughout his entire body. In his chest it seemed to be intensified; every breath caused a sharp pang of pain.

Faltering and uncertain, he arose and peered around. Before, lay the open sea, calm now, and peaceful. Long, rolling swell swept in and dashed themselves against the rocks a few feet away. Rocks? For a moment Parkinson stared at the irregular shore-line

in dazed wonder. Then as his mind cleared, the strangeness of his position flashed upon him.

Solid earth was under his feet! Although he must be hundreds of miles from shore, in some way he had drifted upon land. So far as he knew, there were no islands in that part of the Atlantic; yet his very position belied the truth. He could not have drifted to the mainland; the fact that he was alive precluded all possibilities of that, for he would have drowned in far less time than the latter thought implied.

He turned and inspected the land upon which he had been cast. A small, barren island, bleak and inhospitable, and strangely metallic, met his gaze. The rays of the sun beating down upon it were thrown back with an uncomfortable intensity; the substance of the island was a lustrous, copperlike metal. No soil softened the harshness of the surface; indescribably rugged and pitted was the two hundred-foot expanse. It reminded Parkinson of a bronze relief-map of the moon.

For a moment he puzzled over the strangeness of the

unnatural island; then suddenly he realized the truth. This was the meteor! Obviously, this was the upper side of the great sphere from space, protruding above the sea.

Fortunate for him that the meteor had not been completely covered by water, he thought—but was it fortunate? True, he was alive now, thanks to the tiny island, but how long would he remain alive without food or water, and without hope of securing either? Unless he would be picked up by a passing steamer, he would die a far more unpleasant death than that of drowning. Some miracle had saved him from a watery grave; it would require another to rescue him from a worse fate.

Even now he was beginning to feel thirsty. He had no way of determining how long he had been unconscious, but that it was at least ten hours, he was certain, for the sun had been at its zenith when he had awakened. No less than fifteen hours had gone by since water—other than that of the sea—had passed his lips. And the fact that it was impossible for him to quench his thirst only served to render it more acute.

In order to take his mind from thoughts of his thirst and of the immediate future, he rapidly circled the island. As he had expected, it was utterly barren. With shoulders drooping in despair he settled wearily to a seat on the jagged mass of metal high up on top of the meteor.

An expression of sudden interest lit up his face. For a second time he felt that particular throbbing, that strange pulsing beneath the surface of the meteor. But now it was far more noticeable than before. It seemed to be directly below him, and very close to the surface.

Parkinson could not tell how long he sat there, but from the appearance of the sun, he thought that at the very shortest, an hour passed by while he remained on that spot. And during that time, the throbbing gradually increased until the metal began vibrating under his feet.

Suddenly the bacteriologist leaped aside. The vibrating had reached its height, and the meteor seemed to lurch, to tilt at a sharp angle. His leap

carried him to firm footing again. And then, his thirst and hopeless position completely forgotten, Parkinson stared in fascination at the amazing spectacle before him.

An eighteen-foot disc of metal, a perfect circle, seemed to have been cut out of the top of the meteor. While he watched, it began turning slowly, ponderously, and started sinking into the meteor. As it sank, Parkinson fancied that it grew transparent, and gradually vanished into nothingness—but he wasn't sure.

A great pit, eighteen feet wide, but far deeper, lay before him in the very place where, not more than ten minutes before, he had stood. Not a moment too soon had he leaped.

Motionless he stood there, waiting in tense expectation. What would happen next, he had not the least idea, but he couldn't prevent his imagination from running riot.

He hadn't long to wait before his watching was

rewarded. A few minutes after the pit appeared, he heard a loud, high-pitched whir coming from the heart of the meteor. As it grew louder, it assumed a higher and still higher key, finally rising above the range of human ears. And at that moment the strange vehicle arose to the surface.

A simple-appearing mechanism was the car, consisting of a twelve-foot sphere of the same bronze-like metal that made up the meteor, with a huge wheel, like a bronze cincture, around its middle. It was the whirling of this great wheel that had caused the high-pitched whirring. The entire, strange machine was surrounded by a peculiar green radiance, a radiance that seemed to crackle ominously as the sphere hovered over the mouth of the pit.

For a moment the car hung motionless, then it drifted slowly to the surface of the meteor, landing a few feet away from Parkinson. Hastily he drew back from the greenly phosphorescent thing—but not before he had experienced an unpleasant prickling sensation over his entire body.

As the bacteriologist drew away, there was a sharp, audible click within the interior of the sphere; and the green radiance vanished. At the same moment, three heavy metal supports sprang from equi-distant points in the sides of the car, and held the sphere in a balanced position on the rounded top of the meteor.

There was a soft, grating sound on the opposite side of the car. Quickly, Parkinson circled it—and stopped short in surprise.

Men were descending from an opening in the side of the sphere! Parkinson had reasoned that since the meteor had come from the depths of space, any being in its interior, unnatural as that seemed, would have assumed a form quite different from the human. Of course, conditions on Earth could be approximated on another planet. At any rate, whatever the explanation, the sphere was emitting men!

They were men—but there was something queer about them. They were very tall—seven feet or more—and very thin; and their skins were a delicate, transparent white. They looked rather ghostly in their

tight-fitting white suits. It was not this that made them seem queer, however: it was an indefinite something, a vague suggestion of heartless inhumanity, of unearthliness, that was somehow repulsive and loathsome.

There were three of them, all very similar in appearance and bearing. Their surprise at the sight of Parkinson, if anything, was greater than the start their appearance had given him. He, at least, had expected to see beings of some sort, while the three had been taken completely by surprise.

For a moment they surveyed him with staring, cold-blue eyes. Then Parkinson extended his hand, and as cordially as he could, exclaimed:

"Hello! Welcome to Earth!"

The visitors from space ignored his advances and continued staring at him. Their attitude at first was quizzical, speculative, but slowly a hostile expression crept into their eyes.

Suddenly, with what seemed like common consent, they faced each other, and conversed in low tones in some unintelligible tongue. For almost a minute they talked, while Parkinson watched them in growing apprehension.

Finally they seemed to have reached some definite conclusion; with one accord they turned and moved slowly toward the bacteriologist, something distinctly menacing in their attitudes. The men from the meteor were tall, but they were thin; Parkinson, too, was large, and his six-foot length was covered with layers of solid muscle. As the three advanced toward him, he doubled his fists, and crouched in readiness for the expected attack.

They were almost upon him when he leaped into action. A crushing left to his stomach sent the first one to the meteor-top, where he lay doubled up in pain. But that was the only blow that Parkinson struck; in a moment he found himself lying prone upon his back, utterly helpless, his body completely paralyzed. What they had done to him, he did not know; all that he could remember was two thin bodies

twining themselves around him—a sharp twinge of pain at the base of his skull; then absolute helplessness.

One of the tall beings grasped Parkinson about the waist, and with surprising strength, threw him over his shoulder. The other assisted his groaning fellow. When the latter had recovered to some extent, the three ascended the ladder that led into the metal sphere.

The interior of the strange vehicle, as far as Parkinson could see, was as simple as its exterior. There was no intricate machinery of any sort in the square room; probably what machinery there was lay between the interior and exterior walls of the sphere. As for controls, these consisted of several hundred little buttons that studded one of the walls.

When they entered the vehicle, Parkinson was literally, and none too gently, dumped upon the floor. The man who had carried him stepped over to the controls. Like those of a skilled typist, his long, thin fingers darted over the buttons. In a moment the

sphere was in motion.

There were no more thrills for Parkinson in that ride than he would have derived from a similar ride in an elevator. They sank very slowly for some minutes, it seemed to him; then they stopped with a barely noticeable jar.

The door of the car was thrust aside by one of the three, and Parkinson was borne from the sphere. A bright, coppery light flooded the interior of the meteor, seeming to radiate from its walls. In his helpless state, and in the awkward position in which he was carried, with his head close to the floor, he could see little of the room through which they passed, in spite of the light. Later, however, he learned that it was circular in shape, and about twice the diameter of the cylindrical tube that led into it. The wall that bound this chamber was broken at regular intervals by tall, narrow, doorways, each leading into a different room.

Parkinson was carried into one of these, and was placed in a high-backed metal chair. After he had

been strapped fast, one of the men placed his hands at the base of the bacteriologist's skull; he felt a sudden twinge of pain; and his strange paralysis left him suddenly.

He knew it was useless to struggle; without resisting, he let them place upon his head a cap-like device that seemed lost in a tangled maze of machinery. Each meteor-man grasped one of the instruments resembling old-time radio head-phones that were fastened to Parkinson's head-gear, and clamped it over his ears.

The bacteriologist heard a steady, humming drone, like a swarm of angry bees—felt a peculiar, soothing warmth about his head; and then he slept.

Only a moment or two seemed to have passed when he awoke. The strange device on his head was removed and put away; and then, to Parkinson's amazement, one of the three men, evidently the leader, spoke—in English!

"Now that you have recovered consciousness," he

remarked in a cold, expressionless voice, "you had better realize at the very beginning that you are completely in our power. Any effort to escape will be futile, for there is only one way to reach the outside; the opening through the top; and only one means of travel through that opening: the sphere. And since you know nothing about the operation of the machine, any attempt to run it would be disastrous to you.

"If you promise to refrain from violence, we'll release you, and give you some measure of freedom. We'll do this because you can be of assistance to us in one of our tasks here on your planet."

Parkinson assented readily; he knew he could gain nothing by rejecting their offer. "Of course I'll promise. But—but, how did you learn English?" he asked in bewilderment.

"You taught us," the leader replied. "That device we placed upon your head created a duplicate of your knowledge in our minds. We knew your language, your world, indeed, yourself, as well as you do."

Parkinson shook his head in amazement. Another question came to his mind as the men released him. He was interrupted before he could give it expression.

"Don't ask," the leader exclaimed. "I'll tell our entire story so that you'll have no occasion to annoy us with your questions.

"We're Venerians," he began, "inhabitants of the planet you call Venus. For ages our world has been overcrowded. A short time ago, the conditions became so acute that something had to be done. It was suggested that we seek another habitable planet to which our people could migrate.

"Your Earth was thought to be the world with physical conditions most closely resembling those of Acor, or Venus. Our scientists set to work immediately, using forces and devices with which you are totally unfamiliar, and constructed several missiles which they hurled at Earth. These missiles, spherical masses closely resembling meteors, were set to explode after a certain period of contact with an atmosphere similar to our own. By their explosion we on Venus

could determine whether or not this world had a breathable atmosphere.

"Upon our deciding that the Earth was habitable, we built this great machine. It is chiefly composed of our greatest heat-resister, a metal we call thoque; I see no corresponding word in your vocabulary; evidently you are unfamiliar with the element, or else it is unknown on Earth.

"After our flight through space, automatically controlled, by the way, on Venus, we landed here. With our thoque disintegrator, we bored a passageway to the surface of this great sphere. Then we entered the car, rose to the top of the passageway, and discovered you.

"That is a brief synopsis of our actions—and it must suffice! Ask no questions; we do not wish to be disturbed by the blind gropings of your primitive mind!"

There was a cold finality in the Venerian's voice that convinced Parkinson that for the moment, at least, he

had better forget the many questions that had surged up in his mind.

The Venerian leader spoke again. "From our observations of your mind, we know that you have not had food or water for a rather lengthy period of time. It is not our purpose to starve you: you shall eat and drink."

A minute later Parkinson sat at a very high table in one of the rooms, drinking water from Venus, and eating the fare of an alien world.

Days passed by, merging into weeks, while Parkinson lost all track of time. The bacteriologist's existence became a ceaseless round of toil. The Venerian had said that he would be given some measure of freedom, because he would be of use to them; he had not been with them long ere he learned what that use was.

One of the rooms was filled with great slabs of thoque; it was Parkinson's task to carry the slabs to the vehicle at the base of the shaft, one by one; to rise

to the surface with them, accompanied by two of the men—the third was working on the surface—and there unload them. Day after day this continued.

Hope of escaping was almost dead in Parkinson's breast, because he was constantly under the surveillance of those hard, blue eyes. Only one thing kept hope alive: by watching the Venerians operate the car, he was slowly gaining a knowledge of the meaning of the many buttons in the wall. Some day, if an opportunity came, he meant to be ready to take advantage of it.

Once, shortly after his monotonous toil began, Parkinson experienced a great flare of hope for deliverance. They had just brought another slab to the surface, when a steamer appeared above the horizon. It was far away, but its crew must surely have seen the island.

But his expectations were short-lived. One of the three drew from beneath his tight-fitting, white garments a little, metal object, a long tube, with a handle at one end, and pointed it at the vessel. For a

moment he held it thus, moving it slowly backward and forward: then he returned it to its place of concealment, and turned away with an air of indifference. And Parkinson saw the ship burst suddenly into flame, a few minutes later to sink beneath the waves.

Shaken to the depths of his being, Parkinson resumed his work. The inhumanity of these saturnine Venerians filled him with a dread so great that he refused to admit it to himself. That that had not been the first time that they had destroyed a ship, he felt sure; his heart sank, and grew more hopeless.

At last his task of carrying slabs was finished. The room was empty, and the work completed. A great tower, entirely covering the island, reared its head into the sky. In appearance, it resembled a very tall lighthouse. This resemblance held true only until its top was reached; there it ended. From the tower's top extended four long, hollow arms, so constructed that they whirled about the tower at a mad pace when the machinery with which they were connected was started. In addition, arrangement was made for a

powerful blast of air to be sent through the tubes when the Venerians so desired.

What the purpose of this great edifice was, Parkinson could not guess: later, he learned the horrible significance of it all.

After the tower was finished, the bacteriologist was left to his own devices to a great extent, though always closely watched by one of his captors. They let him eat all the food he desired, and let him lie around as much as he wished, regaining his health and strength. This was a pleasant surprise for him: he took full advantage of his privileges.

Then, one day when Parkinson had fully recovered from the effects of his grueling labors, the leader of the Venerians approached him from behind, and before he could raise a hand in defense, had rendered him helplessly paralyzed.

"You will now be given a second opportunity to help the cause of Venus on Earth," he said in his expressionless voice. And so saying, he lifted

Parkinson, and bore him into one of the rooms.

Chapter 3

At no time while he was held captive by the Venerians was Parkinson as hopeless, or as completely filled with despair as when he was carried into this room. There was something depressing about the chamber, something that gripped his heart with the chill hand of dread. He had a feeling of impending evil.

The few momentary glimpses of the chamber that he had gotten while he was being carried, sufficed to convince Parkinson that this was a laboratory, or—he shuddered at the thought—an operating room. The walls, floor and ceiling were composed of a white porcelainlike substance: from these walls, strangely, streamed the same coppery light that filled the entire meteor.

Entirely concealing one wall was a long, glass case, constructed to form countless little niches, each of which held a small, transparent vessel. At the back of the room was a high table, covered with transparent cases which were filled with complex instruments of every description, some similar to those on Earth;

others entirely different.

The thing that brought the thought of an operating room to Parkinson's mind was the long, white slab that rested on metal uprights in the room's center—an operating table. A moment after they entered the room, he had his theory substantiated: the Venerian leader placed him on the white slab, stretching him to full length. It was an operating table—and he was to be the subject of their operation!

He had lain there but a moment when two of the Venerians approached, one on either side, and began removing his clothing. It was not long before he lay on the cold slab, entirely nude.

While he was being stripped, he heard the leader of the Venerians moving about, heard the click of glass, the rasp of metal upon metal. But, unable to move his eyes, he had seen none of his activities, except to note that several of the little vessels had been taken from their resting places.

When the two had finished disrobing him, and had

replaced him upon his back, the leader appeared. He looked down at Parkinson, a queer expression in his hard, blue eyes. He seemed to hesitate a moment: then he spoke.

"Earthling," he said in his toneless voice, "I have decided to tell you of our intentions. You are going to play a very important part in our scheme, and it is only fitting that you should know. You can do nothing to hinder our plans: you are giving us incalculable aid: and it affords me some degree of satisfaction to tell you this.

"As you know, Earthling, we purpose to have the people of Acor to come to Earth to live, to relieve the congested conditions of our own world. Obviously, there is no room for two types of intelligent beings on one planet—your race must go! It is our intention to destroy all human life on Earth!

"We intend accomplishing this with Venerian microbes. From the record of your knowledge, I've learned that diseases of various kinds are common on Earth. We expected that such would be the case, and

thus, you would not be immune to germs, so we came prepared. Each of the small compartments in that case that you may have seen, contains a culture of a different germ. After we have determined which Venerian bacilli will be the most effective, we will develop them in great quantities, and loose them upon your world.

"In the selecting process, you will play your part. Since our germs may have a different effect upon your bodies than they do upon Venerians, we will inoculate you with different diseases, and watch their effects upon you.

"Of course, you yourself will be in no great danger, for we will have the diseases under our constant control. On Acor we have abolished disease entirely, having a reagent or an antitoxin for every malady; we will use our cures upon you immediately after we have seen how you react to each disease.

"What we desire is a bacillus that will take effect when it is breathed in through the lungs. If the disease is of such a nature as to instill fear in the

minds of observers, so much the better; but that is unnecessary. When we discover a microbe of that nature, we will be ready to act.

"By the way, our work has been lessened to a great degree by the fact that you are a bacteriologist. The knowledge we gain from you has enabled us to eliminate at least half of our microbes. All Venerian germs that are duplicated on Earth will be left out of our calculations. Only those unknown to your planet will be tried upon you."

When the Venerian had finished his explanation, each word of which had sounded like a death knell to Parkinson, the bacteriologist lay on the slab in the grip of a nightmare of horror. The cold-blooded brutality of these Venerian beasts, and the thought of lying there helpless with his body the prey of unknown diseases, filled him with a maddening fear and dread.

Mightily he struggled to break the uncanny bonds that held him paralyzed, but it was of no avail. His body retained its helpless rigidity.

Only for a moment was Parkinson left to his fearful musings; then the Venerians begin their work. A tall table on wheels was brought from somewhere, and drawn to the side of the slab. Upon this various instruments were placed, side by side with numerous flat vessels containing germ cultures. Parkinson saw none of this, but from the sounds that came to his ears he could infer what was taking place.

Finally, everything seemed to be in readiness. The Venerian leader bent over Parkinson for a moment: and the latter felt a sharp pain in his side. Then the Venerian withdrew.

Slowly, interminably, the time dragged by while the microbes that had been introduced into his body were at their work. How long he lay there with the Venerians watching, he could not tell, but it seemed to be hours. During that time he felt himself gripped by an increasingly violent fever. Unbearable heat flooded his body. And because of his helplessness, he could do nothing to relieve his pain and discomfort. It was maddening!

When he thought he had reached the limit of his endurance, and felt that he would go insane in another moment, the Venerian leader injected something into his side. He became aware of an immediate sense of relief; in an unbelievably short time the fever had left him and he was himself again.

There followed for Parkinson hours of nightmare agony, while the Venerians experimented with his living body. Time after time he was inoculated with strange bacilli that wracked him with tortures indescribable. Hideous diseases covered him with festering sores; twisted his flesh into a repellent mass of scars; left him weakened and deformed. Had it not been for the incredible curative powers of the Venerians, he would have died then; but always, when the end seemed at hand, they brought him back to life, only to subject him to other horrors.

After what seemed countless ages, the Venerians left him alone. Under the powerful effects of their cures, Parkinson began to recover. Hope welled up in his heart; perhaps the terrible experiments were ended.

When he was almost certain that the torture was over, his hopes were suddenly destroyed. The three Venerians approached again, each bearing a number of vessels containing germ cultures. These they placed on the table at Parkinson's side; then two of them withdrew, leaving the leader to continue his work. Uttering a few words in the Venerian tongue, he occupied himself with something on the table, and a moment later turned toward the bacteriologist, a long needle in his hands.

Parkinson felt a great burning pain in his left arm, as though a searing, hot needle had been thrust into his flesh. In a moment this vanished. Then a feeling of irresistible lassitude overwhelmed him; an unbearable weariness filled him with longing for rest, peace—death. This, too, was of short duration.

With the passing of the weariness, Parkinson became aware of a sharp throbbing in his arm. Rapidly this increased in violence, until suddenly an unbearable, excruciating agony seized him. Far greater was this than any pain he had suffered before. For a moment he struggled to scream, to move, to do anything to

relieve his agony. There seemed to be a sudden snap—a cry of anguish burst from his lips—and his senses left him. Just as the bonds of paralysis had broken, he had lost consciousness.

Life returned to Parkinson very slowly. In a daze he stared around, uncomprehending. Then suddenly he realized that he was no longer paralyzed: nor was he in the operating room. The bed on which he lay was soft, comfortable; the room, unfamiliar. But not for long did his mind dwell upon this; in a few moments his eyelids closed, and he slept the sleep of complete mental and physical exhaustion.

During the weeks that followed, Parkinson did little other than sleep. Occasionally he arose, either to stretch himself, or to secure food, but for the greater part of the time he remained in bed. His body was a mere shadow of its former self as the result of his terrible experience on the white slab: his incessant sleeping, necessary because of his weakened condition, served to bring him back to his former health. The Venerians seemed glad to have it thus: asleep, he did not disturb their activities.

When he had awakened from his first period of natural slumber, he had received a terrible shock. His left arm was gone, amputated at the shoulder. Strangely, the wound had healed while he slept, probably the result of the Venerian doctoring, so there was no pain: but the shock had been terrible.

After he had recovered from the effects of that shock, he had resolved to make the Venerians pay for what they had done. And then he had realized that the inhuman brutes must be destroyed for a greater reason: unless he interfered, he believed that they would carry out their intention of destroying all human life.

As the weeks passed by, while strength was returning to Parkinson, he learned in a general way what the invaders were doing. They were engaged in developing vast quantities of microbes to be spread over Earth. When these were ready, a great amount of fine dust that the Venerians had brought with them, was impregnated with the bacilli. This was then taken up into the tower, where, as Parkinson learned later, it was blown out through the four tubes that spun

around the tower's top, to drift through the air—to enter human bodies—to destroy life.

The Venerians worked with the cultures and impregnated dust without protection of any sort: evidently they were immune to the disease. Later Parkinson learned that he was likewise immune; they had rendered him so after trying the germs upon him.

Gradually the bacteriologist's health returned—so gradually that his captors seemed not to notice it. He was glad of this, for their vigilance had relaxed, and he did not want it renewed. Even when he was as strong and well as ever, he spent much time in bed, shamming illness. And when he could do so without danger of detection, he kept a close watch upon the three, waiting for a time when he would be entirely alone.

At last his opportunity came. The three Venerians rose to the surface together, leaving him in his room, to all outward appearances, asleep. But sleep was far from him at that moment; he had been watching.

Shortly after the sphere had vanished up the shaft, Parkinson emerged from his room. For a moment he surveyed the circle of doors: then he shrugged his shoulders. They all looked alike to him. Quickly he crossed the room, and pressed a button that mechanically opened a door. It was his purpose, first of all, to secure a weapon; one room would do as well as another for a beginning.

At first glance Parkinson was struck by the strange familiarity of this chamber: then, after a moment, he recognized it. A tall, high-backed metal chair in its center was its mark of identification. This was the chamber wherein the Venerians had transferred a record of his knowledge to their minds.

Carefully he looked around in search of a weapon, but the room held nothing but the chair and the thought transference device. In a moment he withdrew, closing the door behind him.

In the next room he entered, he was fortunate. This chamber was filled with strange devices of various kinds. While curiously inspecting the intricate

machines, he saw something that brought a smile of satisfaction to his lips.

Against one wall stood a tall, glass case, one of the shelves of which held several metal devices that Parkinson immediately recognized as being the Venerians' weapons. Poignantly he remembered how a similar device had destroyed a ship.

Leaving the door slightly ajar, he crossed to the case and secured one of the weapons. For a moment he studied it. There was nothing complex about the mechanism; a cursory examination sufficed to reveal how it was operated. Pressure on a little knob at the back of the handle released the devastating ray.

He was about to slip the device into his pocket when he stiffened involuntarily. There was a sound of movement outside the room—he heard a step on the metal floor—then he whirled.

One of the Venerians stood in the doorway, a menacing frown on his face. He was crouching, ready to spring upon Parkinson.

Quick as thought, the bacteriologist leveled his newly-acquired weapon, and pressed on the knob. There was a sudden spurt of flame from the Venerian's body; then it crumpled, sagging, shrinking together.

Hastily Parkinson released the pressure on the little knob, aghast at the destructive power of his little weapon. Then, as he remembered the torture he had endured at their hands, he directed the ray upon the ashes, until they, too, were consumed, leaving naught but a dark patch on the floor.

For several minutes Parkinson stood there in deep thought. There was no immediate danger from the two remaining Venerians, for they were up in the tower, while the sphere was in the meteor; so he could think with utmost safety. Deep thought and careful planning were necessary now, for he had taken the step that must mean either his death or the death of the Venerians.

Suddenly he leaped into action; he had decided upon his next move. Crossing to the case he secured another weapon. He wasn't sure that they could be

effectively discharged without re-loading; handicapped as he was with one arm gone, he had to be certain of the reliability of his means of defense. Then he left the room, and crossed to the huge thoque sphere.

It was the work of a moment to enter this, and prepare to ascend. This done, he turned his attention to the numerous knobs on the wall. He had not seen them for quite a while; it was with difficulty that he recalled which knobs controlled the car's ascent. At last, hesitantly, but correctly, he pressed on the knobs, and the sphere rose slowly toward the surface.

At the proper moment, Parkinson, brought the vehicle to a halt, and slid back the door. Furtively he peered around. The Venerians were on the other side of the tower. Quickly he lowered the ladder and descended.

As he stepped to the floor, a sudden cry of dismay fell upon his ears. One of the Venerians, coming around the car, had discovered him. Without a moment's hesitation, Parkinson aimed his little weapon, and pressed upon the knob. Like his fellow, the Venerian

fell to the floor, a heap of charred ashes.

With the second Venerian destroyed, Parkinson dashed around the sphere, metal cylinder held in readiness. The leader of the Venerians was stealing stealthily around the other side of the car, his hand fumbling beneath his garment.

"Stop!" Parkinson cried. "Raise your hands above your head—empty!" A cylinder clattered to the metal floor as the Venerian's hands moved skyward.

"Keep your back turned!" Parkinson snapped as the invader began about. "I won't hesitate to press on this little knob, at your first hostile move! I'd thoroughly enjoy burning you to a crisp, so be very careful."

While talking, Parkinson had moved slowly toward the man from Venus; now, almost upon him, he quickly dropped his weapon into a pocket, and swung a terrible blow at the base of his skull. The Venerian fell to the floor without a groan, unconscious.

Parkinson stared at the recumbent figure rather

dubiously for a moment. If only he had his other arm! But it was gone; with an impatient shake of his head he stooped and raised the senseless invader.

It was anything but an easy task for the bacteriologist to carry his seven-foot burden up the ladder and into the sphere, but finally, he succeeded in doing so. Then, without delay, he lowered the car into the meteor again.

As he bore the Venerian from the vehicle, he tried to decide upon his next move. Obviously, he had to secure the one surviving invader, so that he would not be a menace to Parkinson when he revived. And then the logical thing to do would be, in some way, to secure information from him as to how to cure the disease that was spreading over the world.

The logical thing to do, yes—but how? With only one arm, the simple task of binding the Venerian presented considerable difficulty. How much more difficult would it be to force anything from him?

Then the solution of the first problem presented itself

to Parkinson. What was to prevent his strapping this being into the high-backed chair to which he had been secured some time before? Quickly he crossed the circular room to the door he had first passed through while searching for a weapon.

Ten minutes later, when the Venerian regained his senses, he was fastened securely to the tall, metal chair.

"Well," Parkinson addressed him, "conditions seem to be reversed now, and you're the underdog. I've nipped your invasion in the bud. All your elaborate preparations are wasted."

Something resembling a sneer wreathed the Venerian's thin lips; a mocking gleam lit his cold, blue eyes.

"So our efforts have been wasted, have they? I'm afraid I can't agree with you. Already, enough bacteria have been released to destroy all life, though it will take longer than we desire. Even though you kill me, our goal will still be reached. The human race

will die!"

A cloud of gloom fell upon Parkinson. He had expected this; but he had been hoping that he was wrong.

"Then there's only one thing for me to do, and that is: I'll have to force you to tell me how to undo the damage you've done."

The Venerian smiled mirthlessly. "You have absolutely no chance of accomplishing that," he said. "We've done our work too well to allow any interference now.

"You do not know this, but we have released upon your world the worst malady ever known to Venus. There is only one remedy; and I'm the only one who knows it, or who has the means wherewith to accomplish it. And I certainly won't tell!"

The worried expression on Parkinson's face increased in intensity. There was something in the Venerian's voice that convinced him that he meant what he said.

Then suddenly his countenance cleared, and a happy smile replaced his frown.

"Perhaps you won't tell, but I think you will. There are more ways than one of forcing you."

Parkinson had hit upon a solution to his problem. The Venerians had reproduced his knowledge in their brains; why wouldn't it be possible for him to reverse the operation?

In a moment he secured the thought-transference apparatus from a case in the rear of the room, and bore it to the chair, and in spite of the Venerian leader's struggles, placed it upon his head. He put the head-phones over his own ears, and began fumbling with the controls.

Suddenly he seemed to strike the right combination. There was a faint, humming drone in his ears; after a moment this was replaced by a loud crackling—and the knowledge of the man from Venus was becoming his own.

Somewhat dazed, Parkinson shut off the current. His mind was in a turmoil. He was in possession of knowledge of such an amazing character that, for the moment he had lost his mental equilibrium. Indeed, so strange was his new-found knowledge, that he could not grasp the significance of even half of the facts in his mind.

But already, he knew how, with animal electricity, they had paralyzed him; knew what had happened to him on the operating table; knew the nature of the dread disease that destroyed his arm; the Gray Plague—and knew the cure!

A sudden thought arrested this review of his new knowledge. The Gray Plague! At that very moment incalculable quantities of the deadly bacilli were being cast into the air. And he was doing nothing about it!

He glanced at the Venerian. He was still unconscious, and would remain so for some minutes to come. And even if he did recover his senses, he was securely fastened to the chair; Parkinson dashed out of the

room, crossed to the sphere, and passed through the open doorway.

Without hesitation he manipulated the controls, directed by his Venerian knowledge. Rapidly the sphere rose to the surface.

As it came to rest on the floor of the tower, Parkinson sprang from the car, and headed toward a mass of intricate machinery that filled fully a quarter of the great building.

Even this caused him no great concern; he was as familiar with it as he would have been had he constructed it. For some moments he was busy with numerous dials and levers; then the release of the germs was stopped.

Parkinson spent several minutes in examining the contents of the tower, his Earthly mind lost in wonder at the strange things his Venerian knowledge revealed to him. Then he entered the sphere again, and sank into the meteor.

As he moved toward the room that held the Venerian, his mind was busy with conjectures as to what he would do with his prisoner. It was necessary for the bacteriologist to reach the mainland as quickly as possible, and make use of his knowledge of the cure for the Gray Plague. He didn't want to kill the man; he couldn't free him; yet if he left him strapped to the chair, he'd surely die of starvation.

Still undecided, he thrust open the door. With a startled gasp he stopped short. Somehow the Venerian had freed himself; at that moment he leaped toward Parkinson.

Instinctively the bacteriologist flung up his hand in a defensive attitude. The onrushing Venerian caught Parkinson's out-thrust fist in the pit of his stomach, and doubled up in pain. While he was thus defenseless, Parkinson placed a well-directed blow on the side of the Venerian's jaw, a blow carrying every ounce of his strength.

So great was the force of the punch, that it lifted the man from Venus and cast him headlong upon the

floor. His head landed with a sickening thud. Unmoving, he lay where he had fallen.

Parkinson knelt over him for a moment, then arose. Without question, the man was dead. The Venerian had solved the bacteriologist's last problem; he was free to return to the United States with his means of saving mankind.

Drawing the little metal cylinder from his pocket, he burned the body of the Venerian leader to a heap of ashes, ridding the world of the last invader. Then he turned and entered the glass-lined operating room.

Following the dictates of his Venerian knowledge, he crossed to one of the walls, and drew therefrom a flat, glass vessel, somewhat like a petri dish. This contained bacteria that were harmless in themselves, and were hostile to those of the Gray Plague. These germs, brought from Venus, were the only cure for the terrible disease.

The work of the English bacteriologist Twort, in 1915, and the Frenchman, d'Herelle, in 1917, brought to the

attention of the scientific world the fact that many bacteria are subject to attack and destruction by some unknown active agent with which they are associated in infected material. This agent, whatever its character, changed growing germ cultures to a dead, glassy substance.

Twort advanced the thought that the agent might be a living, filtered virus, although he favored the theory that it was an enzyme derived from the bacteria themselves.

D'Herelle, on the contrary, believed that this phenomenon was due to a living, multiplying, ultra-microscopic microbe that destroyed certain bacteria.

Evidence favoring both theories has come to light, with the result that, at present, controversy is rife. Up to date, the contention of neither side has been proved.

Parkinson's adventure was almost at an end. He had not emerged unscathed, but he had won!

The details of his further actions need not be recorded. Suffice it to say that he entered the sphere, carrying his precious, curative germs, arose to the top of the tower, and passed through a round opening in its side. His borrowed knowledge revealed that the car possessed abilities that he had not suspected; with amazing speed he caused it to flash across the Atlantic Ocean to the United States.

There he saw the frightful carnage that the Plague had caused, saw the deserted cities—and was filled with self-reproach because he had not acted sooner.

Across the miles and miles of deserted country he sped, following the fleeing hordes, finally passing over the stragglers and landing in the heart of the congested areas. After making a few inquiries, he returned to the sphere, and continued on toward the West. He landed, finally, outside the city of San Francisco.

A short time later, twisted, deformed, yet triumphant, he was ushered into the presence of the United States government as—the man who had saved the human

race.

Chapter 4

The terrible days of the Gray Plague ended in mystery. Much that had puzzled the world, Parkinson, with his Venerian knowledge, explained; but there was one thing, the final, enigmatical act in the strange drama, that was as much of a mystery to him as it was to the rest of the world.

Enigma! Of what significance, of what portent—who could tell?

When the great vessel from the United States, equipped to destroy the meteor of the Venetians, neared the great thoque sphere, they came upon a scene quite different from what they had expected. Parkinson, who was on the ship, was more surprised than the rest, for he had definite knowledge of what, in the natural course of events, they should see. For the others there was nothing so very strange in what they saw; Parkinson had lied, that was all.

When the bacteriologist had left the meteor, there had been a high, bronze-colored tower, a burnished

lighthouse, covering its entire top. It had been there—but now it was gone! Only the jagged, arched surface of the meteor remained.

They lowered boats and rowed to the strange island. There they saw something that filled them—Parkinson especially—with a very definite uneasiness. The entire top of the meteor was a twisted, fire-blasted mass of bronze-like metal. Where the tower had been, where the shaft had led into the remarkable interplanetary vehicle, there was now a broken expanse of thoque that flashed fire under the rays of the sun.

Something seemed to have melted, to have fused the tower, until it had crumpled, and had run, filling the entrance of the meteor. There was irrefutable evidence to that effect; no one thought otherwise.

But what agency had done this strange thing?

Someone suggested that it might have been the work of some prearranged mechanism. Parkinson shook his head. Had such been the case, his Venerian knowledge would have told him so.

Obviously, nothing of Earth had done it, nothing of Earth—then something of Venus! Inconclusive conjecture, perhaps, but no other explanation offered itself. Something had sealed the contents of the meteor from the sight of man, something with a purpose. From Venus? The thought was logical, to say the least.

Not for long did they remain there beside the Venerian vehicle; there was naught for them to do, so they turned about and headed toward the United States. They bore tidings that were vaguely disturbing, tidings that none were glad to hear. For, according to all indications, something alien to Earth was still within her confines.

Behind it all—the meteors, the Plague, the sealing of the Venerian vehicle—is one fact of great significance. No longer is man alone in the universe; no longer is he in isolation! Out of space came a menace, an intelligence striving to wrest from him his right to rule over Earth. No longer can man in his smug complacency think of himself as being secure in his strength. He has been shown the utter folly of such

thinking.

The menace—the invaders from Venus—came, and were destroyed, their purposes defeated. Yet—in the vast reaches of space, in worlds of other dimensions, in the cosmic crucible of life that embodies all creation, there may be other forms of life, other menaces, hovering clouds of death, preparing to sweep down upon Earth to snuff out her life. Who can tell?

And who may say that man is free from the Venerian danger? The strange sealing of the meteor implies that the menace is still present. Who knows but what those inhuman Venerian brutes may even now be planning some new invasion, may be preparing to renew their attack upon Earth?

Time alone will tell.

#59 Vagabonds Of Space, By Harold Vincent Schoepflin:

From the depths of the Sargasso Sea of space came the thought-warning, "Turn back!" but Carr and his Martian friend found it was too late!

Aproximate word count:

Bigotry:

Warnings:

went mad with fury

Chapter 1: The Nomad

Gathered around a long table in a luxuriously furnished director's room, a group of men listened in astonishment to the rapid and forceful speech of one of their number.

From the depths of the Sargasso Sea of Space came the thought-warning, "Turn back!" But Carr and his Martian friend found it was too late!

"I tell you I'm through, gentlemen," averred the speaker. "I'm fed up with the job, that's all. Since 2317 you've had me sitting at the helm of International Airways and I've worked my fool head off for you. Now—get someone else!"

"Made plenty of money yourself, didn't you, Carr?" asked one of the directors, a corpulent man with a self-satisfied countenance.

"Sure I did. That's not the point. I've done all the work. There's not another executive[245] in the outfit

whose job is more than a title, and you know it. I want a change and a rest. Going to take it, too. So, go ahead with your election of officers and leave me out."

"Your stock?" Courtney Davis, chairman of the board, sensed that Carr Parker meant what he said.

"I'll hold it. The rest of you can vote it as you choose: divide the proxies pro rata, based on your individual holdings. But I reserve the right to dump it all on the market at the first sign of shady dealings. That suit you?"

The recalcitrant young President of International Airways had risen from the table. The chairman attempted to restrain him.

"Come on now, Carr, let's reason this out. Perhaps if you just took a leave of absence—"

"Call it anything you want. I'm done right now."

Carr Parker stalked from the room, leaving eleven

perspiring capitalists to argue over his action.

He rushed to the corridor and nervously pressed the call button of the elevators. A minute later he emerged upon the roof of the Airways building, one of the tallest of New York's mid-town sky-scrapers. The air here, fifteen hundred feet above the hot street, was cool and fresh. He walked across the great flat surface of the landing stage to inspect a tiny helicopter which had just settled to a landing. Angered as he was, he still could not resist the attraction these trim little craft had always held for him. The feeling was in his blood.

His interest, however, was short lived and he strolled to the observation aisle along the edge of the landing stage. He stared moodily into the heavens where thousands of aircraft of all descriptions sped hither and yon. A huge liner of the Martian route was dropping from the skies and drifting toward her cradle on Long Island. He looked out over the city to the north: fifty miles of it he knew stretched along the east shore of the Hudson. Greatest of the cities of the world, it housed a fifth of the population of the United

States of North America; a third of the wealth.

Cities! The entire world lived in them! Civilization was too highly developed nowadays. Adventure was a thing of the past. Of course there were the other planets, Mars and Venus, but they were as bad. At least he had found them so on his every business trip. He wished he had lived a couple of centuries ago, when the first space-ships ventured forth from the earth. Those were days of excitement and daring enterprise. Then a man could find ways of getting away from things—next to nature—out into the forests; hunting; fishing. But the forests were gone, the streams enslaved by the power monopolies. There were only the cities—and barren plains. Everything in life was made by man, artificial.

Something drew his eyes upward and he spotted an unusual object in the heavens, a mere speck as yet but drawing swiftly in from the upper air lanes. But this ship, small though it appeared, stood out from amongst its fellows for some reason. Carr rubbed his eyes to clear his vision. Was it? Yes—it was—surrounded by a luminous haze. Notwithstanding the

brilliance of the afternoon sun, this haze was clearly visible. A silver shimmering that was not like anything he had seen on Earth. The ship swung in toward the city and was losing altitude rapidly. Its silvery aura deserted it and the vessel was revealed as a sleek, tapered cylinder with no wings, rudders or helicopter screws. Like the giant liners of the Interplanetary Service it displayed no visible means of support or propulsion. This was no ordinary vessel.

Carr watched in extreme interest as it circled the city in a huge spiral, settling lower at each turn. It seemed that the pilot was searching for a definite landing stage. Then suddenly it swooped with a rush. Straight for the stage of the Airways building! The strange aura reappeared and the little vessel halted in mid-air, poised a moment, then dropped gracefully and lightly as a feather to the level surface not a hundred feet from where he stood. He hurried to the spot to examine the strange craft.

"Mado!" he exclaimed in surprise as a husky, bronzed Martian squeezed through the quickly opened manhole and clambered heavily to the platform. Mado

of Canax—an old friend!

"Devils of Terra!" gasped the Martian, his knees giving way, "—your murderous gravity! Here, help me. I've forgotten the energizing switch."

Carr laughed as he fumbled with a mechanism that was strapped to the Martian's back. Mado, who tipped the scales at over two hundred pounds on his own planet, weighed nearly six hundred here. His legs simply couldn't carry the load!

"There you are, old man." Parker had located the switch and a musical purr came from the black box between the Martian's broad shoulders. "Now stand up and tell me what you're doing here. And what's the idea of the private ship? Come all the way from home in it?"

His friend struggled to his feet with an effort, for the field emanating from the black box required a few seconds to reach the intensity necessary to counteract two-thirds of the earth's gravity.

"Thanks Carr," he grinned. "Yes, I came all the way in that bus. Alone, too—and she's mine! What do you think of her?"

"A peach, from what I can see. But how come? Not using a private space-flier on your business trips, are you?"

"Not on your life! I've retired. Going to play around for a few years. That's why I bought the Nomad."

"Retired! Why Mado, I just did the same thing."

"Great stuff! They've worked you to death. What are you figuring on doing with yourself?"

Carr shrugged his shoulders resignedly. "Usual thing, I suppose. Travel aimlessly, and bore myself into old age. Nothing else to do. No kick out of life these days at all, Mado, even in chasing around from planet to planet. They're all the same."

The Martian looked keenly at his friend. "Oh, is that so?" he said. "No kick, eh? Well, let me tell you, Carr

Parker, you come with me and we'll find something you'll get a kick out of. Ever seen the Sargasso Sea of the solar system? Ever been on one of the asteroids? Ever seen the other side of the Moon—Uranus—Neptune—Planet 9, the farthest out from the sun?"

"No-o." Carr's eyes brightened somewhat.

"Then you haven't seen anything or been anywhere. Trouble with you is you've been in the rut too long. Thinking there's nothing left in the universe but the commonplace. Right, too, if you stick to the regular routes of travel. But the *Nomad's* different. I'm just a rover when I'm at her controls, a vagabond in space—free as the ether that surrounds her air-tight hull. And, take it from me, there's something to see and do out there in space. Off the usual lanes, perhaps, but it's there."

"You've been out—how long?" Carr hesitated.

"Eighty Martian days. Seen plenty too." He waved his arm in a gesture that seemed to take in the entire universe.

"Why come here, with so much to be seen out there?"

"Came to visit you, old stick-in-the-mud," grinned Mado, "and to try and persuade you to join me. I find you footloose already. You're itching for adventure; excitement. Will you come?"

Carr listened spellbound. "Right now?" he asked.

"This very minute. Come on."

"My bag," objected Carr, "it must be packed. I'll need funds too."

"Bag! What for? Plenty of duds on the *Nomad*—for any old climate. And money—don't make me laugh! Vagabonds need money?" He backed toward the open manhole of the *Nomad*, still grinning.

Carr hesitated, resisting the impulse to take Mado at his word. He looked around. The landing stage had been deserted, but people now were approaching. People not to be tolerated at the moment. He saw Courtney Davis, grim and determined. There'd be

more arguments, useless but aggravating. Well, why not go? He'd decided to break away. What better chance? Suddenly he dived for the[248] manhole of Mado's vessel; wriggled his way to the padded interior of the air-lock. He heard the clang of the circular cover. Mado was clamping it to its gasketed seat.

"Let's go!" he shouted.

Chapter 2: Into the Heavens

The directors of International Airways stared foolishly when they saw Carr Parker and the giant Martian enter the mysterious ship which was a trespasser on their landing stage. They gazed incredulously as the gleaming torpedo-shaped vessel arose majestically from its position. There was no evidence of motive power other than a sudden radiation from its hull plates of faintly crackling streamers of silvery light. They fell back in alarm as it pointed its nose skyward and accelerated with incredible rapidity, the silver energy bathing them in its blinding luminescence. They burst forth in excited recrimination when it vanished into the blue. Courtney Davis shook his fist after the departing vessel and swore mightily.

Carr Parker forgot them entirely when he clambered into the bucket seat beside Mado, who sat at the Nomad's controls. He was free at last: free to probe the mysteries of outer space, to roam the skies with this Martian he had admired since boyhood.

"Glad you came?" Mado asked his Terrestrial friend.

"You bet. But tell me about yourself. How you've been and how come you've rebelled, too? I haven't seen you for a long time, you know. Why, it's been years!"

"Oh, I'm all right. Guess I got fed up with things about the same way you did. Knew last time I saw you that you were feeling as I did. That's why I came after you."

"But this vessel, the *Nomad*. I didn't know such a thing was in existence. How does it operate? It seems quite different from the usual ether-liners."

"It's a mystery ship. Invented and built by Thrygis, a discredited scientist of my country. Spent a fortune on it and then went broke and killed himself. I bought it from the executors for a song. They thought it was a pile of junk. But the plans and notes of the inventor were there and I studied 'em well. The ship is a marvel, Carr. Utilizes gravitational attraction and reversal as a propelling force and can go like the Old Boy himself. I've hit two thousand miles a second with her."

"A second! Why, that's ten times as fast as the regular liners! Must use a whale of a lot of fuel. And where do you keep it? The fuel, I mean."

"Make it right on board. I'm telling you Carr, the *Nomad* has no equal. She's a corker."

"I'll say she is. But what do you mean—make the fuel?"

"Cosmic rays. Everywhere in space you know. Seems they are the result of violent concentrations of energy that cause the birth of atoms. Thrygis doped out a collector of these rays that takes 'em from their paths and concentrates 'em in a retort where there's a spongy metal catalyst that never deteriorates. Here there is a reaction to the original action out in space and new atoms are born, simple ones of hydrogen. But what could be sweeter for use in one of our regular atomic motors? The energy of disintegration is used to drive the generators of the artificial gravity field, and there you are. Sounds complicated, but really isn't. And nothing to get out of whack either."

"Beats the rocket motors and bulky fuel of the regular liners a mile, doesn't it? But since when are you a navigator, Mado?"

"Don't need to be a navigator with the *Nomad*. She's automatic, once the controls are set. Say we wish to visit Venus. The telescope is sighted on that body and the gravity forces adjusted so we'll be attracted in that[249] direction and repelled in the opposite direction. Then we can go to bed and forget it. The movement of the body in its orbit makes no difference because the force follows wherever it goes. See? The speed increases until the opposing forces are equal, when deceleration commences and we gradually slow down until within ten thousand miles of the body, when the *Nomad* automatically stops. Doesn't move either, until we awaken to take the controls. How's that for simple?"

"Good enough. But suppose a wandering meteor or a tiny asteroid gets in the way? At our speed it wouldn't have to be as big as your fist to go through us like a shot."

"All taken care of, my dear Carr. I told you Thrygis was a wiz. Such a happenstance would disturb the delicate balance of the energy compensators and the course of the *Nomad* would instantly alter to dodge the foreign object. Once passed by, the course would again be resumed."

"Some ship, the *Nomad*!" Carr was delighted with the explanations. "I'm sold on her and on the trip. Where are we now and where bound?"

Mado glanced at the instrument board. "Nearly a million miles out and headed for that Sargasso Sea I told you about," he said. "It isn't visible in the telescope, but I've got it marked by the stars. Out between the orbits of Mars and Jupiter, a quarter of a billion miles away. But we'll average better than a thousand miles a second. Be there in three days of your time."

"How can there be a sea out there in space?"

"Oh, that's just my name for it. Most peculiar thing, though. There's a vast, billowy sort of a cloud. Twists

and weaves around as if alive. Looks like seaweed or something; and Carr, I swear there are things floating around in it. Wrecks. Something damn peculiar, anyway. I vow I saw a signal. People marooned there or something. Sorta scared me and I didn't stay around for long as there was an awful pull from the mass. Had to use full reversal of the gravity force to get away."

"Now why didn't you tell me that before? That's something to think about. Like the ancient days of ocean-going ships on Earth."

"Tell you? How could I tell you? You've been questioning me ever since I first saw you and I've been busy every minute answering you."

Carr laughed and slid from his seat to the floor. He felt curiously light and loose-jointed. A single step carried him to one of the stanchions of the control cabin and he clung to it for a moment to regain his equilibrium.

"What's wrong?" he demanded. "No internal gravity

mechanism on the *Nomad*?"

"Sure is. But it's adjusted for Martian gravity. You'll get along, but it wouldn't be so easy for me with Earth gravity. I'd have to wear the portable G-ray all the time, and that's not so comfortable. All right with you?"

"Oh, certainly. I didn't understand."

Carr saw that his friend had unstrapped the black box from his shoulders. He didn't blame him. Glad he wasn't a Martian. It was mighty inconvenient for them on Venus or Terra. Their bodies, large and of double the specific gravity, were not easily handled where gravity was nearly three times their own. The Venusians and Terrestrials were more fortunate when on Mars, for they could become accustomed to the altered conditions. Only had to be careful they didn't overdo. He remembered vividly a quick move he had made on his first visit to Mars. Carried him twenty feet to slam against a granite pedestal. Bad cut that gave him, and the exertion in the rarefied atmosphere had him gasping painfully.

He walked to one of the ports and peered through its thick window. Mado was fussing with the controls. The velvety blackness of the heavens;[250] the myriad diamond points of clear brilliance. Cold, too, it looked out there, and awesomely vast. The sun and Earth had been left behind and could not be seen. But Carr didn't care. The heavens were marvelous when viewed without the obstruction of an atmosphere. But he'd seen them often enough on his many business trips to Mars and Venus.

"Ready for bed?" Mado startled him with a tap on the shoulder.

"Why—if you say so. But you haven't shown me through the *Nomad* yet."

"All the time in the universe for that. Man, don't you realize you're free? Come, let's grab some sleep. Need it out here. The ship'll be here when we wake up. She's flying herself right now. Fast, too."

Carr looked at the velocity indicator. Seven hundred miles a second and still accelerating! He felt suddenly

tired and when Mado opened the door of a sleeping cabin its spotless bunk looked very inviting. He turned in without protest.

Chapter 3: A Message

The days passed quickly, whether measured by the Martian chronometer aboard the *Nomad* or by Carr's watch, which he was regulating to match the slightly longer day of the red planet. He was becoming proficient in the operation of all mechanisms of the ship and had developed a fondness for its every appointment.

Behind them the sun was losing much of its blinding magnificence as it receded into the ebon background of the firmament. The Earth was but one of the countless worlds visible through the stern ports, distinguishable by its slightly greenish tinge. They had reached the vicinity of the phenomenon of space Mado had previously discovered. Carr found himself seething with excitement as the *Nomad* was brought to a drifting speed.

Mado, who had disclaimed all knowledge of navigation, was busy in the turret with a sextant. He made rapid calculations based on its indications and hurried to the controls.

"Find it?" Carr asked.

"Yep. Be there in a half hour."

The nose of the vessel swung around and Mado adjusted the gravity energy carefully. Carr glued his eye to the telescope.

"See anything?" inquired Mado.

"About a million stars, that's all."

"Funny. Should be close by."

Then: "Yes! Yes! I see it!" Carr exulted. "A milky cloud. Transparent almost. To the right a little more!"

The mysterious cloud rushed to meet them and soon was visible to the naked eye through the forward port. Their speed increased alarmingly and Mado cut off the energy.

"What's that?" Mado stared white-faced at his friend.

"A voice! You hear it too?"

"Yes. Listen!"

Amazed, they gazed at each other. It was a voice; yet not a sound came to their ears. The voice was in their own consciousness. A mental message! Yet each heard and understood. There were no words, but clear mental images.

"Beware!" it seemed to warn. "Come not closer, travelers from afar. There is danger in the milky fleece before you!"

Mado pulled frantically at the energy reverse control. The force was now fully repelling. Still the billowing whiteness drew nearer. It boiled and bubbled with the ferocity of one of the hot lava cauldrons of Mercury. Changing shape rapidly, it threw out long streamers that writhed and twisted like the arms of an octopus. Reaching. Searching for victims!

"God!" whispered Carr. "What is it?"

"Take warning," continued the voice that was not a voice. "A great ship, a royal ship from a world

unknown to you, now is caught in the grip of this[251] mighty monster. We can not escape, and death draws quickly near. But we can warn others and ask that our fate be reported to our home body."

A sudden upheaval of the monstrous mass spewed forth an object that bounced a moment on the rippling surface and then was lost to view. A sphere, glinting golden against the white of its awful captor.

"The space-ship!" gasped Mado. "It's vanished again!"

They hurtled madly in the direction of this monster of the heavens, their reverse energy useless.

"We're lost, Mado." Carr was calm now. This was excitement with a vengeance. He'd wished for it and here it was. But he'd much rather have a chance to fight for his life. Fine ending to his dreams!

"Imps of the canals! The thing's alive!" Mado hurled himself at the controls as a huge blob of the horrible whiteness broke loose from the main body and wobbled uncertainly toward them. A long feeler

reached forth and grasped the errant portion, returning it with a vicious jerk.

"Turn back! Turn back!" came the eery warning from the golden sphere. "All is over for us. Our hull is crushed. The air is pouring from our last compartment. Already we find breathing difficult. Turn back! The third satellite of the fifth planet is our home. Visit it, we beseech you, and report the manner of our going. This vile creature of space has power to draw you to its breast, to crush you as we are crushed."

The *Nomad* lurched and shuddered, drawn ever closer to the horrid mass of the thing. A gigantic jellyfish, that's what it was, a hundred miles across! Carr shivered in disgust as it throbbed anew, sending out those grasping streamers of its mysterious material. As the *Nomad* plunged to its doom with increasing speed, Mado tried to locate some spot in the universe where an extreme effect could be obtained from the full force of the attracting or repulsive energies. They darted this way and that but always found themselves closer to the milky billows

that now were pulsating in seeming eagerness to engulf the new victim.

Once more came the telepathic warning, "Delay no longer. It is high time you turned back. You must escape to warn our people and yours. Even now the awful creature has us in its vitals, its tentacles reaching through our shattered walls, creeping and twining through the passages of our vessel. Crushing floors and walls, its demoniac energies heating our compartment beyond belief. We can hold out no longer. Go! Go quickly. Remember—the third satellite of the fifth planet—to the city of golden domes. Tell of our fate. Our people will understand. You—"

The voice was stilled. Mado groaned as if in pain and Carr saw in that instant that each knob and lever on the control panel glowed with an unearthly brush discharge. Not violet as of high frequency electricity, but red. Cherry red as of heated metal. The emanations of the cosmic monster were at work on the *Nomad*. A glance through the forward port showed they had but a few miles to go. They'd be in the clutches of the horror in minutes, seconds, at the

rate they were traveling. Mado slumped in his seat, his proud head rolling grotesquely on his breast. He slid to the floor, helpless.

Carr went mad with fury. It couldn't be! This thing of doom was a creature of his imagination! But no—there it was, looming close in his vision. By God, he'd leave the mark of the *Nomad* on the vicious thing! He remembered the ray with which the vessel was armed. He was in the pilot's seat, fingering controls that blistered his hands and cramped his arms with an unnameable force. He'd fight the brute! Full energy—head on—that[252] was the way to meet it. Why bother with the reversal? It was no use.

A blood-red veil obscured his vision. He felt for the release of the ray; pulled the gravity energy control to full power forward. In a daze, groping blindly for support, he waited for the shock of impact. The mass of that monstrosity must be terrific, else why had it such a power of attraction for other bodies? Or was it that the thing radiated energies unknown to science? Whatever it was, the thing would know the sting of the *Nomad's* ray. Whatever its nature, animate or

inanimate, it was matter. The ray destroyed matter. Obliterated it utterly. Tore the atoms asunder, whirling their electrons from their orbits with terrific velocity. There'd be some effect, that was certain! No great use perhaps. But a crater would mark the last resting place of the *Nomad*; a huge crater. Perhaps the misty whiteness would close in over them later. But there'd be less of the creature's bulk to menace other travelers in space.

His head ached miserably; his body was shot through and through with cramping agonies. The very blood in his veins was liquid fire, searing his veins and arteries with pulsing awfulness. He staggered from the control cabin; threw himself on his bunk. The covers were electrified and clung to him like tissue to rubbed amber. The wall of the sleeping cabin vibrated with a screeching note. The floors trembled. Madness! That's all it was! He'd awaken in a moment. Find himself in his own bed at home. He'd dreamed of adventures before now. But never of such as this! It just couldn't happen! A nightmare—fantasy of an over-tired brain—it was.

There came a violent wrench that must have torn the hull plates from their bracings. The ship seemed to close in on him and crush him. A terrific concussion flattened him to the bunk. Then all was still. Carr Parker's thoughts broke short abruptly. He had slipped into unconsciousness.

Chapter 4: Europa

When Carr opened his eyes it was to the normal lighting of his own sleeping cabin. The *Nomad* was intact, though an odor of scorched varnish permeated the air. They were unharmed—as yet. He turned on his side and saw that Mado was moving about at the side of his couch. Good old Mado! With a basin of water in his hand and a cloth. He'd been bathing his face. Brought him to. He sat up just as Mado turned to apply the cloth anew.

"Good boy, Carr! All right?" smiled the Martian.

"Little dizzy. But I'm okay." Carr sprang to his feet where he wobbled uncertainly for a moment. "But the *Nomad*?" he asked. "Is she—are we safe?"

"Never safer. What in the name of Saturn did you do?"

Carr passed his hand across his eyes, trying to remember. "The D-ray," he said. "I turned it on and dived into the thing with full attraction. Then—I forget. Where is it—the thing, I mean?"

"Look!" Mado drew him to the stern compartment.

Far behind them there shone a misty wreath, a ring of drifting matter that writhed and twisted as if in mortal agony.

"Is that it?"

"What's left of it. You shot your way through it; through and out of its influence. D-ray must have devitalized the thing as it bored through. Killed its energies—for the time, at least."

Already, the thing was closing in. Soon there would be a solid mass as before. But the *Nomad* was saved.

"How about yourself?" asked Carr anxiously. "Last time I saw you you were flat on the floor."

"Nothing wrong with me now. A bit stiff and sore, that's all. When I came to I put all the controls in neutral and came looking for you. I was scared,[253] but the thing's all over now, so let's go."

"Where?"

"Europa."

"Where's that?"

"Don't you remember? The third satellite of the fifth planet. That's Europa, third in distance from Jupiter, the fifth planet. It is about the size of Terra's satellite—your Moon. We'll find the city of the golden domes."

Carr's eyes renewed their sparkle. "Right!" he exclaimed. "I forgot the mental message. Poor devils! All over for them now. But we'll carry their message. How far is it?"

"Don't know yet till I determine our position and the position of Jupiter. But it's quite a way. Jupiter's 483 million miles from the Sun, you know."

"We're more than half way, then."

"Not necessarily. Perhaps we're on the opposite side of the sun from Jupiter's present position. Then we'd

have a real trip."

"Let's figure it out." Carr was anxious to be off.

Luck was with them, as they found after some observations from the turret. Jupiter lay off their original course by not more than fifteen degrees. It was but four days' journey.

Again they were on their way and the two men, Martian and Terrestrial, made good use of the time in renewing their old friendship and in the study of astronomy as they had done during the first leg of their journey. Though of widely differing build and nature, the two found a close bond in their similar inclinations. The library of the *Nomad* was an excellent one. Thrygis had seen to that, all of the voice-vision reels being recorded in Cos, the interplanetary language, with its standardized units of weight and measurement.

The supplies on board the *Nomad* were ample. Synthetic foods there were for at least a hundred Martian days. The supply of oxygen and water was

inexhaustible, these essential items being produced in automatic retorts where disassembled electrons from their cosmic-ray hydrogen were reassembled in the proper structure to produce atoms of any desired element. Their supply of synthetic food could be replenished in like manner when necessity arose. Thrygis had forgotten nothing.

"How do you suppose we'll make ourselves understood to the people of Europa?" asked Carr, when they had swung around the great orb of Jupiter and were headed toward the satellite.

"Shouldn't have any trouble, Carr. Believe me, to a people who have progressed to the point of sending mental messages over five hundred miles of space, it'll be a cinch, understanding our simple mental processes. Bet they'll read our every thought."

"That's right. But the language. Proper names and all that. Can't get those over with thought waves."

"No, but I'll bet they'll have some way of solving that too. You wait and see."

Carr lighted a cigar and inhaled deeply as he gazed from one of the ports. He'd never felt better in his life. Always had liked Martian tobacco, too. Wondered what they'd do when the supply ran out. One thing they couldn't produce synthetically. The disc of the satellite loomed near and it shone with a warmly inviting light. Almost red, like the color of Mars, it was. Sort of golden, rather. Anyway, he wondered what awaited them there. This was a great life, this roaming in space, unhampered by laws or conventions. The *Nomad* was well named.

"Wonder what they'll think of our yarn," he said.

"And me. I wonder, too, what that ungodly thing was back there. The thing that is now the grave of some of their people. And what the golden sphere was doing so far from home. It's a mystery."

They had gone over the same ground a hundred times and had not reached a satisfactory conclusion.[254]
But perhaps they'd learn more in the city of golden domes.

"Another thing," said Carr, "that's puzzled me. Why is it that Europa has not been discovered before this; that it's inhabited, I mean?"

"Rocket ships couldn't carry enough fuel. Besides, our astronomers've always told us that the outer planets were too cold; too far from the sun."

"That is something to think about. Maybe we'll not be able to stand the low temperature; thin atmosphere; low surface gravity."

"We've our insulated suits and the oxygen helmets for the first two objections. The G-rays'll hold us down in any gravity. But we'll see mighty soon. We're here."

They had entered the atmosphere as they talked and the *Nomad* was approaching the surface in a long glide with repulsion full on. It was daytime on the side they neared. Pale daylight, but revealing. The great ball that was Jupiter hung low on the horizon, its misty outline faintly visible against the deep green of the sky.

The surface over which they skimmed was patchworked with farm-lands and crisscrossed by gleaming ribbons. Roadways! It was like the voice-vision records of the ancient days on Mars and Terra before their peoples had taken to the air. Here was a body where a person could get out in the open; next to nature. They crossed a lake of calm green water fringed by golden sands. At its far side a village spread out beneath them and was gone; a village of broad pavements and circular dwellings with flat rooms, each with its square of ground. A golden, mountain range loomed in the background; vanished beneath them. More fields and roads. Everywhere there were yellows and reds and the silver sheen of the roads. No green save that of the darkening sky and the waters of the streams and ponds. It was a most inviting panorama.

Occasionally they passed a vessel of the air—strange flapping-winged craft that soared and darted like huge birds. Once one of them approached so closely they could see its occupants, seemingly a people similar to the Venusians, small of stature and slender.

"How in time are we to find this city of golden domes?" Carr ejaculated.

As if in answer to his question there came a startling command, another of the mental messages.

"Halt!" it conveyed to their mind. "Continue not into our country until we have communed with you."

Obediently Mado brought up the nose of the *Nomad* and slowed her down to a gradual stop. They hovered at an altitude of about four thousand feet, both straining their ears as if listening for actual speech.

"It is well," continued the message. "Your thoughts are good. You come from afar seeking the city of golden domes. Proceed now and a fleet of our vessels will meet you and guide you to our city."

"Now wouldn't that jar you?" whispered Carr. "Just try to get away with anything on this world."

Mado laughed as he started the generators of the propelling energy. "I'd hate to have a wife of Europa,"

he commented. "No sitting-up-with-sick-friend story could get by with her!"

Chapter 5: The City of Golden Domes

With the *Nomad* cruising slowly over the surface of the peaceful satellite, Mado sampled the atmosphere through a tube which was provided for that purpose. The pressure was low, as they had expected; about twenty inches of mercury in the altitude at which they drifted. But the oxygen content was fairly high and the impurities negligible. A strange element was somewhat in evidence, though Mado's analysis showed this to be present in but minute quantity. They opened the ports and drew their first breath of the atmosphere of Europa.[255]

"Good air, Carr." Mado was sniffing at one of the ports. "A bit rare for you, but I think you'll get along with it. Temperature of forty-five degrees. That's not so bad. The strangest thing is the gravity. This body isn't much more than two thousand miles in diameter, yet its gravity is about the same as on Venus—seven eighths of that of Terra. Must have a huge nickel-iron core."

"Yes. It'll be a cinch for me. But you, you big lummox

—it's the G-ray for you as long as we're here."

"Uh-huh. You get all the breaks, don't you?"

Carr laughed. He was becoming anxious to land.

"What sort of a reception do you suppose we'll get?"
he said.

"Not bad, from the tone of that last message. And here they come, Carr. Look—a dozen of them. A royal reception, so far."

Suddenly they were in the midst of a flock of great birds; birds that flapped their golden wings to rise, then soared and circled like the gulls of the terrestrial oceans. And these mechanical birds were fast. Carr and Mado watched in fascination as they strung out in V formation and led the way in the direction of the setting sun. Six, seven hundred miles an hour the *Nomad's* indicator showed, as they swung in behind these ships of Europa.

They crossed a large body of water, a lake of fully five hundred miles in width. More country then, hardly

populated now and with but few of the gleaming roadways. The sun had set, but there was scarcely any diminution of the light for the great ball that was Jupiter reflected a brilliance of far greater intensity than that of the full Moon on a clear Terrestrial night. A marvelous sight the gigantic body presented, with its alternate belts of gray-blue and red and dazzling white. And it hung so low and huge in the heavens that it seemed one had but to stretch forth a hand to touch its bright surface.

Another mountain range loomed close and was gone. On its far side there stretched the desolate wastes of a desert, a barren plain that extended in all directions to the horizon. Wind-swept, it was and menacing beneath them. Europa was not all as they had first seen it.

A glimmer of brightness appeared at the horizon. The fleet was reducing speed and soon they saw that their journey was nearly over. At the far edge of the desert the bright spot resolved itself into the outlines of a city, the city of golden domes. Cones they looked like, rather, with rounded tops and fluted walls. The

mental message had conveyed the most fitting description possible without words or picture.

The landing was over so quickly that they had but confused impressions of their reception. A great square in the heart of the city, crowded with people. Swooping maneuvers of hundreds of the bird-like ships. An open space for their arrival. The platform where a committee awaited them. The king, or at least he seemed to be king. The sea of upturned faces, staring eyes.

Mado fidgeted and opened his mouth to voice a protest but Carr nudged him into silence. The king had risen from his seat in the circle on the platform and was about to address them. There was no repetition of the telepathic means of communication.

"Welcome, travelers from the inner planets," said the king. He spoke Cos perfectly! "Cardos, emperor of the body you call Europa, salutes you. Our scientists have recorded your thoughts with their psycho-ray apparatus and have learned that you have a message for us, a message we fear is not pleasant. Am I

correct?"

Carr stared at the soft-voiced monarch of this remarkable land. It was incredible that he spoke in the universal language of the inner planets!

"Your Highness," he replied, "is correct. We have a message. But it[256] amazes us that you are familiar with our language."

"That we shall explain later. Meanwhile—the message!"

"The message," Carr said, "is not pleasant. A golden sphere out in space. Helpless in the clutches of a nameless monster, a vast creature of jellylike substance but possessed of enormous destructive energy. A mental message to our vessel warning us away and bidding us to come here; to tell you of their fate. We escaped and here we are."

The face of Cardos paled. He reached for an egg-shaped crystal that reposed on the table; spoke rapidly into its shimmering depths. Hidden amplifiers

carried his voice throughout the square in booming tones. It was a strange tongue he spoke, with many gutturals and sibilants. A groan came up from the assembled multitude.

Cardos tossed the crystal to the table with a resigned gesture, then tottered and swayed. Instant confusion reigned in the square and the emperor was assisted from the platform by two of his retainers. They never saw him again.

One of the counsellors, a middle-aged man with graying russet hair and large gray eyes set in a perfectly smooth countenance, stepped from the platform and grasped the two adventurers as the confusion in the square increased to an uproar.

"Come," he whispered, in excellent Cos; "I'll explain all to you in the quiet of my own apartments. I am Detis, a scientist, and my home is close by."

Gently he clung to them as the larger men forced their way between the milling groups of excited Europeans. No one gave them much attention. All

seemed to be overcome with grief. A terrible disaster, this loss of the golden sphere must be!

They were out of the square and in one of the broad streets. The fluted sides of the unpointed cones shone softly golden on all sides. Alike in every respect were these dwellings of the people of Europa, and strangely attractive in the light of the mother planet.

Not a word was spoken when they reached the abode of their guide. They entered an elaborate hall and were whisked upward in an automatic elevator. Detis ushered them into his apartment when they alighted. He smiled gravely at their looks of wonder as they cast eyes on the maze of apparatus before them. It was a laboratory rather than a living room in which they stood.

Detis led them to an adjoining room where he bid them be seated. They exchanged wondering glances as their host paced the floor vigorously before speaking further.

"Friends," he finally blurted, "I hope you'll excuse my

emotion but the news you brought is a terrible blow to me as to all Europa. Carli, our prince, beloved son of Cardos, was commander of the ship you reported lost. We deeply mourn his loss."

Carr and Mado waited in respectful silence while their host made effort to control his feelings.

"Now," he said, after a moment, "I can talk. You have many questions to ask, I know. So have I. But first I must tell you that Carli's was an expedition to your own worlds. A grave danger hangs over them and he was sent to warn them. He has been lost. Our only space-ship capable of making the journey also is lost. Six Martian years were required to build it, so I fear the warning will never reach your people. Already the time draws near."

"A grave danger?" asked Mado. "What sort of a danger?"

"War! Utter destruction! Conquest by the most warlike and ambitious people in the solar system."

"Not the people of Europa?" asked Carr.

"Indeed not. There is another inhabited satellite of Jupiter, next farthest from the mother planet.

Ganymede, you call it. It is from there^[257] that these conquerors are to set forth."

"Many of them?" inquired Mado.

"Two million or so. They're prepared to send an army of more than a tenth of that number on the first expedition."

"A mere handful!" Carr was contemptuous.

"True, but they are armed with the most terrible of weapons. Your people are utterly unprepared and, unless warned, will be driven from their cities and left in the deserts to perish of hunger and exposure. This is a real danger."

"Something in it, Carr, if what he says is true. We've no arms nor warriors. Haven't had for two centuries. You know it as well as I do."

"Bah! Overnight we could have a million armed and ready to fight them off."

Detis raised his hand. "You offend me," he said gravely. "I have told you this in good faith and you reward me with disbelief and boastful talk. Your enemies are more powerful than you think, and your own people utterly defenceless against them."

"I'm sorry," Carr apologized, "and I'll listen to all you have to say. Surely your prince has not given his life in vain." He was ashamed before this scientist of Europa.

A tinkling feminine voice from the next room called something in the European tongue.

Detis raised his head proudly and his frown softened at the sound of dainty footsteps. His voice was a caress as he replied.

A vision of feminine loveliness stood framed in the doorway and the visitors rose hastily from their seats. Carr gazed into eyes of the deepest blue he had ever

seen. Small in stature though this girl of Europa was —not more than five feet tall—she had the form of a goddess and the face of an angel. He was flushing to the roots of his hair. Could feel it spread. What an ass he was anyway! Anyone'd think he'd never seen a woman in all his thirty-five years!

"My daughter, Ora, gentlemen," said Detis.

The girl's eyes had widened as she looked at the huge Martian with the funny black box on his back. They dropped demurely when turned to those of the handsome Terrestrial.

"Oh," she said, in Cos, "I didn't know you had callers."

Chapter 6: Vlor-uridin

The time passed quickly in Pala-dar, city of the golden domes. Detis spent many hours in the laboratory with his two visitors and the fair Ora was usually at his side. She was an efficient helper to her father and a gracious hostess to the guests.

The amazement of the visitors grew apace as the wonders of European science were revealed to them. They sat by the hour at the illuminated screen of the rulden, that remarkable astronomical instrument which brought the surfaces of distant celestial bodies within a few feet of their eyes, and the sounds of the streets and the jungles to their ears. It was no longer a mystery how the language of Cos had become so familiar to these people.

They learned of the origin of the races that inhabited Europa and Ganymede. Ages before, it was necessary for the peoples of the then thickly populated Jupiter to cast about for new homes due to the cooling of the surface of that planet. Life was becoming unbearable. In those days there were two dominant races on the

mother body, a gentle and peaceful people of great scientific accomplishment and a race of savage brutes who, while very clever with their hands, were of lesser mental strength and of a quarrelsome and fighting disposition.

Toward the last the population of both main countries was reduced to but a few survivors, and the intelligent[258] race had discovered a means of traversing space and was prepared to leave the planet for the more livable satellite—Europa. Learning of these plans, the others made a treaty of perpetual peace as a price for their passage to another satellite—Ganymede. The migration began and the two satellites were settled by the separate bands of pioneers and their new lives begun.

The perpetual treaty had not been broken since, but the energies of the warlike descendants of those first settlers of Ganymede were expended in casting about for new fields to conquer. Through the ages they cast increasingly covetous eyes on those inner planets, Mars, Terra and Venus. Not having the advantage of the Rulden, they knew of these bodies only what

could be seen through their own crude optical instruments and what they had learned by word of mouth from certain renegade Europeans they were able to bribe.

While their neighbors of the smaller satellite were engaged in peaceful pursuits, tilling the soil and making excellent homes for themselves, the dwellers on Ganymede were fashioning instruments of warfare and building a fleet of space-ships to carry them to their intended victims. It was a religion with them; they could think of nothing else. An unscrupulous scientist of Europa sold himself to them several generations previously and it was this scientist who had made the plans for their space-fliers and had contrived the deadly weapons with which they were armed. He likewise taught them the language of Cos and it now was spoken universally throughout Ganymede in anticipation of the glorious days of conquest.

"You honestly believe them able to do this?" asked Carr, still skeptical after two days of discussion.

"I know it as a certainty," Detis replied solemnly. "It is only during the past generation we have learned of the completeness and awfulness of their preparations. Your people can not combat their sound-ray. With it they can remain outside the vision of those on the surface and set the tall buildings of your cities in harmonic vibrations that will bring them down in ruins about the ears of the populace."

"There'll be nothing left for them to take if they destroy all our cities: nowhere for them to live. I don't get it."

"Only a few will be destroyed completely, to terrify the rest of the inhabitants of your worlds. Others will be depopulated by means of vibrations that will kill off the citizens without harming the cities themselves—vibrations which are capable of blanketing a large area and raising the body temperature of all living things therein to a point where death will ensue in a very few minutes. Other vibrations will paralyze all electrical equipment on the planet and make it impossible for your ships of the air to set out to give battle, even were they properly armed."

"Looks bad, Carr," said Mado glumly.

"It does that. We've got to go back and carry the warning."

"I fear it is too late," said Detis. "Much time will be needed in which to develop a defense and surely it can not be done within the three isini before they set forth—about four of your days."

"They leave that soon?" Carr was taken aback.

"Yes, with their one hundred and twenty vessels; forty to each of your three planets; seventeen hundred men to a vessel."

Carr jumped to his feet. "By the heat devils of Mercury!" he roared, "we'll go to their lousy little satellite and find a way to prevent it!"

Ora gazed at his flushed face with unconcealed admiration.

"You're crazy!" exploded Mado. "What can we do with

the *Nomad*?"[259]

"Her D-ray can do plenty of damage."

"Yes, but they'd have us down before we could account for five of their vessels. It's no use, I tell you."

But Carr was stubborn. "We'll pay them a call anyway. I'll bet we can dope out some way of putting it over on them. Are you game?"

"Of course I'm game. I'll go anywhere you will. But it's a fool idea just the same."

"Maybe so. Maybe not. Anyway—let's go."

"Just a moment, gentlemen," Detis interposed. "How about me?"

Carr stared at him and saw that his eyes shone with excitement. "Why, I believe you'd like to go with us!" he exclaimed admiringly.

"I would, indeed."

"Come on then. We're off." He was impatient to be gone.

Detis busied himself with a small apparatus that folded into a compact case, explaining that it was one that might prove useful. Ora left the room but quickly returned. She too carried a small case, and she had donned a snug fitting leather garment that covered her from neck to knees.

"What's this?" demanded Carr. "Surely Miss Ora does not intend to come with us?"

"She never leaves my side," said Detis proudly.

"Nothing doing!" Carr stated emphatically. "There'll be plenty of danger on this trip. Well have no woman along—least of all your charming daughter."

Mado was leaving everything to his friend, but he grinned in anticipation when he saw the look of anger on the girl's face.

She stamped her little foot and faced Carr valiantly.

"See here, Mr. Carr Parker!" she stormed. "I'm no weakling. I'm the daughter of my father and where he goes I go. You'll take me or I'll never speak to you again."

Carr flushed. He was accustomed to his own way in most things and entirely unused to the ways of the gentler sex. He could have shaken the little vixen! But now she was standing before him and there was something in those great blue eyes besides anger; something that set his heart pounding madly.

"All right!" he agreed desperately, "have your own way."

He turned on his heel and strode to the door. Giving in to this slip of a girl! What a fool he was! But it would be great at that to have her along in the *Nomad*.

They found the public square deserted, the gilded dwellings hung with somber colors in mourning for Carli. Ora and Detis were very quiet and preoccupied when they entered the *Nomad*. The five isini of

lamentation for the young prince had not yet passed.

The two Europeans were delighted with the appointments and mechanisms of the little vessel from Mars. They investigated every nook and cranny of its interior during the journey and were voluble in their praise of its inventor and builder. Neither had ever set foot in a space-flier and each was seized with a longing to explore space with these two strangers from the inner planets. They would make a couple of good vagabonds along with Mado and himself, Carr thought as they expressed their feelings. But there was more serious business at hand. They were nearing Ganymede.

"Where'll we land, Detis?" Mado called from the control cabin.

"Vlor-uridin. That is their chief city. I'll guide you to the location."

They took up their places at the ports and scanned the surface of the satellite as Mado dropped the ship into its atmosphere. A far different scene was

presented than on Europa. The land was seamed and scarred, the colors of the foliage somber. Grays and browns predominated and the jungles seemed impenetrable. A river swung into view and its waters were black as[260] the deepest night, its flow sluggish. A rank mist hung over the surface.

"The river of Charis!" exclaimed Detis. "Follow it, Mado. No, the other direction. There! It leads directly to Vlor-uridin."

By good chance they had entered the atmosphere at a point not far from their destination. In less than an hour by the *Nomad's* chronometer the towers of Vlor-uridin were sighted.

It was a larger city than Pala-dar and of vastly different appearance. A hollow square of squat buildings enclosed the vast workshops and storage space of the fleet of war vessels. Their huge spherical bulks rose from their cradles in tier after tier that stretched as far as the eye could reach when the *Nomad* had dropped to a level but slightly above the tips of the highest spires. The spires were

everywhere, decorative towers at the corners of the squat buildings. Everything was black, the vessels of the fleet, the squat buildings and the spires of Vlorurdin. Death was in the air. Rank vapor drifted in through the opened ports. There was silence in the city below them and silence in the *Nomad*.

Ora shuddered and drew closer to him. Carr was aware of her nearness and a lump rose in his throat. A horrible fear assailed him. Fear for the safety of the dainty European at his side. He found her hand; covered it protectingly with his own.

Chapter 7: Rapaju

Detis was setting up and adjusting the complicated mechanisms of his little black case. A dozen vacuum tubes lighted, and a murmur of throbbing energy came from a helix of shining metallic ribbon that topped the whole. Flexible cables led to a cap-like contrivance which Detis placed on his head. He frowned in concentration.

"The psycho-ray apparatus." Ora explained. "He's sending a message to the city."

Evidently the influence of the ray was directive. They had no inkling of the thoughts transmitted from the alert brain of the scientist but, from the look of satisfaction on his face, they could see that he was obtaining the desired contact.

"Rapaju," he exclaimed, switching off the power of his instrument, "commander of the fleet of the Llotta. I have advised him of our arrival. Told him that a Martian and a Terrestrial wish to treat with him concerning the proposed invasion of their planets. His

answering thought first was of fiercest rage, then conciliatory in nature. He'll receive you and listen to your arguments, though he promises nothing. Is that satisfactory?"

"Yes." Carr and Mado were agreed. At least it would give them a chance to look over the ground and to make plans, should any occur to them.

The *Nomad* circled over the heart of the city and soon Mado saw a suitable landing space. They settled gracefully in an open area close by the building indicated by Detis as that of the administration officials of the city.

A group of squat, sullen Llotta awaited them and, without speaking a word either of hatred or welcome, led them into the forbidding entrance of the building. Close-set, beady eyes; unbelievably flat features of chalky whiteness; chunky bowed legs, bare and hairy; long arms with huge dangling paws—these were the outstanding characteristics of the Llotta. Mado stared straight before him, refusing to display any great interest in the loathsome creatures, but Carr was

frankly curious and as frankly disapproving.

Rapaju leered maliciously when the four voyagers stood before him. He looked the incarnation of all that was evil and vile, a monster among monsters. Sensing him to be the more aggressive of the two visitors from doomed planets, he addressed his remarks to Carr.

[261]

"You come to plead with Rapaju," he sneered, his Costinged with an outlandish accent, "to beg for the worthless lives of your compatriots; for the wealth of your cities?"

"We come to reason with you," replied Carr haughtily, "if you are capable of reasoning. What is this incredible thing you are planning?"

Mado gasped at the effrontery of his friend. But Carr was oblivious of the warning looks cast in his direction.

"Enough of that!" snapped Rapaju. "I'll do the talking—you the reasoning. I've a proposition to make to

you, and if you know what's best, you'll agree. Otherwise you'll be first of the Terrestrials to die. Is that clear?"

"Clear enough, all right," growled Carr. "What do you mean—a proposition?"

"Ha! I thought you'd listen. My offer is the lives of you and your companion in exchange for your assistance in guiding my fleet to the capital cities of your countries. Not that our plans will be changed if you refuse, but that much time will be saved in this manner and quick victory made certain without undue sacrifice of valuable property."

"You—you—!" Carr stammered in anger. But there was no use in raising a rumpus—now. They'd only kill him. Something might be accomplished if he pretended to accede. "Go on with your story," he finished lamely.

"In addition to sparing your lives I'll place you both in high position after we seize your respective planets. Make you chief officers in the prison lands we intend

to establish for your countrymen. What do you say?"

"Will you give us time to talk it over and think about it?"

"Until the hour of departure, if you wish."

Carr bowed, avoiding Mado's questioning eyes. He looked at Ora where she stood at the side of Detis. She flashed him a guarded smile. He knew that she understood.

Rapaju relaxed. He was confident he could bribe these puerile foreigners to help him in the great venture. And sadly he needed such help. The Llotta were not navigators. Their knowledge of the heavens was sadly incomplete. They had no maps of the surfaces of the planets to be visited. Their simultaneous blows would be far more effective and the campaign much shorter if they could choose the most vital centers for the initial attacks.

"Now," he said, "that we understand one another, let us talk further of the plans. Then you will be able to

consider carefully before making your decision."

Rapaju could be diplomatic when he wished. Carr longed to sink his fingers in the hairy throat. But he smiled hypocritically and found an opportunity to wink meaningly at Mado. This was going to be good! And who knew?—perhaps they might find some way to outwit these mad savages. To think of them in control of the inner planets was revolting.

They retired to a small room with Rapaju and four of his lieutenants, Detis and Ora accompanying them. Ora sat close to Carr at the circular table in Rapaju's council. Carr thought grimly of the board meetings in far away New York.

Rapaju talked. He told of the armament of his vessels, painting vivid pictures of the destruction to be wrought in the cities of Terra, of Mars and Venus. His great hairy paws clutched at imaginary riches when he spoke glowingly of the plundering to follow. He spoke of the women of the inner planets and Carr half rose from his seat when he observed the lecherous glitter in his beady eyes. Ora! Great God, was she safe

here? He stole a glance at the girl and a recurrence of the awful fear surged through him. In her leather garment, close fitting and severe, she looked like a boy. Perhaps they would not know. Besides, there was the perpetual treaty with Europa. It always had been observed, Detis said.[262]

As Rapaju expanded upon the glories to come he told perforce of many of the details of the plans. One thing stood out in Carr's mind: the vessels of the *Llotta* were not equal to the *Nomad* in many respects. They must carry their entire supply of fuel from the starting point and this was calculated as but a small percentage in excess of that required to carry them to their destinations. Their speed was not as great as the *Nomad's* by at least a third. If the *Nomad* led the fleet from Ganymede they might be able to get them off their course; cause them to run out of fuel out in the vacuum and absolute zero of space. He kicked Mado under the table and arose to ask a few leading questions.

Ora was whispering to her father and he nodded his head as if in complete agreement with what she was

saying. These two were not deceived by his apparent traitorous talk, but Mado was aghast. Carr wondered if Rapaju believed him as did his friend.

"We'll do it, Rapaju," he stated finally. "In our ship, the *Nomad*, we'll guide you across the trackless wastes of the heavens. We'll take you to our capital cities; point out to you the richest of the industrial centers. We have no love for our own worlds. Mado and I deserted them for a life of vagabondage amongst the stars. We ask no reward other than that we be permitted to leave once more on our travels, to roam space as we choose."

Mado attempted to voice an objection but Carr's hand was heavy on his shoulder. "Shut up, you fool!" he hissed in his ear. "Can't you trust me?"

Rapaju's eyes seemed to draw closer together as he returned Carr's unflinching stare. He walked around the table and stood at the side of the tall Terrestrial. Suddenly he grasped Ora's jacket, tore it open at the throat. He ran his hairy fingers over the bare shoulder of the shrinking girl and gurgled his delight

at the velvet smoothness of her skin.

With a roar like a wild animal Carr was upon him, bearing him to the floor. His fingers were in that hairy throat, where they had itched to twine.

"Dirty, filthy beast!" he was snarling. "Lay your foul hands on Ora, will you? Say your prayers, if you know any, you swine!"

Then his muscles went limp and he was jerked to his feet by a terrible force, a force that sent him reeling and gasping against the wall. One of Rapaju's lieutenants stood before him with a tiny weapon in his hand, the weapon which had released the paralyzing gas he breathed. He was choking; suffocating. A black mist rose before him. He felt his knees give way. Dimly, as in a dream, he saw that Ora was in Detis' arms. Rapaju was on his feet, fingering his neck and laughing horribly.

"The treaty, Rapaju!" Detis was shouting.

Ora was sobbing. Mado was in the hands of two of the

vile Llotta, struggling wildly to free himself. The Martian's eyes accused him. He shut his own and groaned. Opened them again. But it was no use. Everything in the room was whirling now, crazily. He fought to regain his senses, crawled weakly toward the squat figure of Rapaju where it swayed and twisted and spun around. Then all was darkness. The gas had taken its toll.

Chapter 8: The Expedition

Carr awakened to a sense of wordless disgust. Fool that he was to spill the beans as he had! All set to put one over on the leader of the Llotta, then to come a cropper like this! He knew he had been spared for a purpose. The gas was not intended to kill, only to render him helpless for a time. He opened his eyes to the light of a familiar room. He had awakened before in this bed. It was his own cabin on board the *Nomad*. What had happened? Had he dreamed it all. Europa, Ora, Rapaju—all[263] of it? He sat up and felt of his aching head.

"Oh, are you awake?" a soft voice greeted him.

"Ora!" he exclaimed. It was indeed she, beautiful as ever.

"Sh-h," she warned, placing the tip of a finger to his lips. "They'll hear us."

"Who?" he whispered.

"Rapaju—his two guards. They're in the control cabin with father and Mado."

"What? They've taken the *Nomad*?"

"Yes. We're under way. They've forced Mado to guide them but do not trust him. Rapaju spared you as he believes you more capable. He'll hold you to your word."

"Lord! But what are you doing here?"

Ora dropped her eyes. "He—Rapaju—" she said, "inferred from your action in assaulting him that you were very fond of me. He holds me as a hostage for your good behavior. Father volunteered to come along. He persuaded Rapaju to allow it. Swore allegiance to his cause. Of course he wouldn't leave me."

Carr gazed at her in admiration of her courage. She had been nursing him, too! What a girl she was!

"Ora," he said huskily, "Rapaju was right. I am fond of

you. More than fond: I love you. I never knew I could feel this way."

"Oh Carr, you mustn't!" She drew back as he scrambled to his feet. "They'll find us. We must not show that we care. Rapaju is a beast. He wants me for himself and is delaying the time only until you have brought the fleet safely to the inner planets and to their great cities. He—"

"The skunk! Wants you himself, does he? Why, why didn't I kill him? But Ora, you said—you do care—"

"Ha! I thought so!" Rapaju stood in the doorway, grinning mockingly at the pair. "The impetuous Terrestrial is up and about. Back at his old game!"

"Please, please, for my sake, Carr!" Ora pressed him back as he tensed his muscles for a spring.

"Sorry I was so slow," Carr grated, over her shoulder. "Another five seconds, Rapaju, and I'd have had your windpipe out by the roots."

Rapaju scowled darkly and fingered his throat. "But, my dear Carr, you were too slow," he said, "and I live—and shall live—while you shall die. Meanwhile you'll carry out your agreement. Come, Ora."

The girl hesitated a moment, then with a pleading glance at Carr stepped from the room.

"All right now, Parker," snapped Rapaju. "Into your clothes and into the pilot's seat. You'll stay there, too, till the journey's over. Get busy!"

One of his guards had appeared in the doorway. Carr knew that resistance was useless. Besides, seated at those controls, he might think of something. Rapaju'd never get Ora if he could help it!

Mado's shoulders drooped and his face was haggard and drawn, but he summoned a smile when he saw Carr.

"Hello, Carr," he said. "You all right?"

"Sure. Rapaju says I've got to take the controls."

"Very well." Mado shrugged his broad shoulders and slipped from the pilot's seat. Two ugly Llotta guards were watching, ray-pistols in hand. "The chart is corrected, Carr, and—"

"Never mind the conversation!" Rapaju snarled. "There'll be no talk between you at all. Beat it to your cabin, Mado."

The Martian glowered and made as if to retort hotly.

"But Rapaju," Detis interposed, speaking from his position at one of the ports, "they'll have to consult regarding the course of the vessel. Mado is more familiar than Carr with the navigation of space."

"Shut up!" roared Rapaju. "I know what I am doing. And, what's more,[264] you'll not converse with them, either! I'm running this expedition, and I'm not taking any chances."

Detis subsided and followed Mado through the passage to the sleeping cabins.

The ensuing silence was ominous. Carr could feel the eyes of the Llotta upon him as he examined the adjustments of the controls and peeped through the telescope. A glance at the velocity indicator showed him they were traveling at a rate of eight hundred miles a second. He studied the chart and soon made out their position. Jupiter was a hundred million miles behind them and they were heading almost due sunward. The automatic control mechanism was not functioning. Evidently Mado had kept this a secret—and for a purpose. He wished he could talk with his friend. They'd plan something.

"Like your job?" Rapaju was gloating over this Terrestrial who had dared to lay hands upon him.

"Yes, but not the company." Carr was disdainful.

"You'll like it less before I've finished with you. And get this straight. You think we're dependent on you to guide us to the inner planets, and that we'll not harm any of you until they are reached. Don't fool yourself! I've watched Mado and I've spent much time in the excellent library of the *Nomad*. I've learned plenty

about the navigation of space and can reach those planets as quickly and directly as you. But it pleases me to see you work, so work you shall. I'll check you carefully, and don't think you can deceive me. Don't try to depart from the true course. The sun is my check as it is yours, and I'll keep constant tab on our position. Get it?"

"A rather long speech, Rapaju." Carr grinned into the evil face of the commander.

"Still defiant, eh? Suits me, Carr Parker. We'll have some nice talks here, and then—when it pleases me—you'll suffer. You shall live to see your home city crash in utter ruin; your people slain, starved, beaten. And, above all, there's Ora—"

"Don't defile her name in your ugly mouth, you—!"

Carr bit his tongue to keep back the torrent of invectives that sprang to his lips. This would never do! He'd get himself bumped off before they were well started. And while there was life there was hope. He'd stick to his guns and think; think and plan. If

only he could have a few words with Mado. They must get out of this mess. There must be a way! There must!

Rapaju was laughing in triumph. Thought he had cowed him, did he? Boastful savage! If he could navigate the *Nomad* himself, why didn't he? Liar! He and Mado were godsend to him, and he knew it! His speech at the council table had been the real truth.

Foreign thoughts entered his mind. Detis, good old Detis, was using his thought apparatus in his own cabin! He paid no attention to the words of Rapaju when he left the control room. Detis was on the job! Between them they'd outwit this devil of Ganymede.

"Keep your courage," came the message. "I've read the thoughts of Mado and he bids you examine the chart carefully. He's made some notations in the ancient language of Mars. The automatic control of the *Nomad* can be used when necessary. He has not advised Rapaju of its existence."

Carr was encouraged and he concentrated on a

suitable reply. But, though he did not consciously will it, his thoughts were of Ora.

Instantly there came the reassurance of her father. "Ora is not in immediate danger. Rapaju is saving her for his revenge on you. And I'm watching her constantly. A ray-pistol is concealed in my clothing, its charge ready for the foul creature in case he should lay hands on her. But you must plan[265] an escape, and salvation for your worlds. Examine the chart at once."

He looked from the corner of his eye and saw that one of the Llotta guards was watching intently. He peered into the eye-piece of the telescope; made an inconsequential change in one of the adjustments. The guard stirred but did not arise. He looked at the chart with new interest, scanned its markings carefully. What had Mado marked for his attention? There were hundreds of notations, some in Cos and a few in the ancient Martian, all in Mado's painstaking chirography.

Ah, there it was! A tiny spot almost on their course,

with Mado's minute notation. Sargasso Sea! What did it mean? Did Mado intend to lead the fleet into the embrace of that dreadful monster they had so fortunately escaped? An excellent idea to save the inner planets. But suicide for them! He'd do it though, if it weren't for Ora. She was so sweet and innocent. She must not die; must not suffer. Another way must be found. He groaned aloud as he realized that her predicament was the result of his own bullheadedness. If only he hadn't insisted on the trip to Ganymede. But then there was the problem of preserving the civilization of the inner planets. It had to be met.

There was a commotion behind him; a feminine shriek from the after cabins; loud shoutings from the beast called Rapaju. Carr's heart skipped a beat. He was paralyzed with fear. But only for an instant. With a bellow of rage he whirled around and started for the door, charging the two guards with head down and arms flailing.

Chapter 9: Nemesis

The Llotta did not use their ray-pistols. They were too busy attempting to elude the mad rushes of the powerful Terrestrial. Besides, there were good reasons they should not kill him—yet. Carr drove one of them halfway down the passageway with a well-planted punch. The other was on his back, hairy legs twined around his waist, an arm under his chin, drawing his head back with a steady and terrible pressure. He whirled around, trying to shake off his beastly antagonist.

But these powerful legs and arms held fast. He tore at the hairy ankles where they crossed in the pit of his stomach; wrenched them free. Still the creature clung to him, twisting his head until it seemed his neck must break. He found a waving foot with his right hand; wrenched it mightily. There was a sharp snap and the foot dangled limp in his fingers. He had broken the ankle. With a howl of pain his assailant let go and dropped to the floor to crawl away like a whipped cur.

In a flash Carr saw that the brute was reaching for his ray-pistol where it had dropped during the encounter. He kicked it from the reach of that hairy paw and sprang after it. With one of those little weapons in his hands the odds would change! His fingers closed on its grip just as Ora rushed into the room, closely followed by Rapaju, whose distorted features were terrible to behold. The cabin was full of them now; the guard he had first knocked down; the lust-crazed commander—the one with the broken ankle. All but Detis and Mado. Carr faced them alone.

So close was Rapaju to the girl that he dared not use the pistol, and now the uninjured guard was circling him, trying to get in a position where he could use his ray-pistol without endangering his commander. Carr fumbled for the release of the weapon he held in his hand; found it. The guard threw himself to the floor when he saw it raised; shouted a warning. But it was too late. The deadly ray had sped on its mission of death; struck him full in the middle. The twisted body lay still a moment and then collapsed like a punctured balloon, leaving his scant[266] clothing in a limp heap

—empty. A worthy miniature of the D-ray, this little weapon!

He turned to face Rapaju and saw that he was shielding himself with Ora's body. She had fainted and now hung drooping in the arms of the beast. Where was Mado? Detis? Good God—he'd killed them! Carr thought of that little spot on the chart. Must be very close now. They'd pass so near there'd be no escape. But he could not reach the controls without taking his eyes from Rapaju. That would have to wait.

Rapaju was backing toward the door, still holding the limp figure of the girl before him. The injured guard lay moaning on the floor.

"Drop her, you devil!" Carr shouted desperately as he saw that Rapaju soon would reach the passageway.

Then suddenly he reached for the controls and pushed the energy lever to full speed forward. He braced himself for the shock of acceleration and saw Rapaju and Ora thrown backward into the passageway, the girl's body cushioned by that of her

captor as they were flung violently to the floor. Madly he rushed to the narrow entrance and tore at the hairy arms that encircled the slender waist of the girl. He jerked the snarling commander of the Llotta expedition to his feet and slammed him against the metal wall.

"Now, you damn pig," he grunted, "I'll finish the job. Dirty scum of a rotten world!"

He dragged his victim into the control cabin and threw him to the floor. But Rapaju was like an eel. He wriggled from under him and snatched from the heap of clothing the ray-pistol of the disintegrated guard. With a yelp of triumph he rose to his knees and leveled the weapon.

A well placed kick sent it spinning and Carr was upon him. He snapped back the head with a terrible punch; then lifted the dazed creature to his feet and stepped back.

"Stand up and take it like a man!" he roared.

Rapaju shook his head to clear it and rushed in with a bellow of rage. Just what Carr wanted! Starting almost from the floor, his right came up to meet the vicious jaw with a crack that told of the terrific power behind it. Lifted from his feet and hurled half way across the room by the impact, Rapaju lay motionless where he fell.

Carr was at the telescope. Their speed was close to fifteen hundred miles a second. The monstrous mass of Mado's Sargasso Sea loomed close in his vision. Off their course by a hundred miles or more. They'd miss it all right. He had the situation in hand now on board the *Nomad*. But how about the fleet behind them? He thought fast and furiously. Another two minutes and they'd pass the thing; the inexplicable horror which had accounted for the golden sphere of the Europeans. Could he use it? Suppose the fleet of the enemy—

The idea was full of possibilities.

He rushed to the stern compartment, and scanned the heavens for the massed body of spheres he knew would be the fleet of the Llotta. At this speed they

must have fallen far behind. Yes, there they were. Not so far behind at that. The battle in the control room must have been a shorter one than it had seemed. He returned quickly to the controls and reversed the energy, to give the fleet a chance to catch up to him.

Closer came that mass of whitish jelly. And now it was much larger than before. The terrible creature, for living matter it was, beyond doubt, was growing with the rapidity of a rising flood. Great tentacles of its horrid translucent substance reached in all directions for possible victims. He sickened at the sight. But what a fate for the fleet of the Llotta! If only he could maneuver them into its influence.[267]

He changed his course slightly and headed directly for the monster, again increasing speed. Perhaps—if he calculated the forces correctly—he could dive through it again with the D-ray to clear a path. But no. It was a miracle they had escaped before, and now the vicious thing was more than double its previous size. Once more he altered his course. He'd cross in front of the thing; skim it as close as he dared and shoot from its influence on the far side. The greater

mass of the enemy vessels and their lack of a quick-acting repulsive force would prove their undoing.

Full speed ahead. A rapid mental calculation—an educated guess, rather—and he set the automatic control. Turning around to start for the stern compartment, he saw that Ora had recovered from her swoon and now stood swaying weakly in the passageway.

"Ora!" he exclaimed delightedly. He rushed to her side and supported her in a tender embrace.

"Rapaju?" she questioned with horror in her eyes.

"Won't bother you for a while, dear. But your father—Mado?"

"He gassed them. They'll recover." The brave girl had regained her composure.

"Good! But, come! Time's short." He half carried her to the rear, berating himself the while for his inability to pay her closer attention. With arms still around her

he placed her at one of the stern ports.

"What is it, Carr?" She sensed his excitement.

"The fleet—see! We'll destroy them."

The spherical vessels were close behind, huddled together in mass formation and following the *Nomad* blindly.

"How, Carr?"

"Lead them into it. Wait till you see! There's a—"

The *Nomad* lurched, and changed direction. Cold fear clutched at his throat. That devil of a guard! Why hadn't he killed him? He dashed through the passage, Ora at his heels.

Sure enough, the crippled guard had dragged himself to the controls; was manipulating the energy director as he had seen Mado do. They were heading directly for the terrible monster of the heavens!

No need now to peer through the telescope. The thing was visible to the naked eye. No power could save them! Carr hurled himself at the guard and tore at the hairy paw which gripped the lever. The throbbing of strange energies filled the air of the room, and Carr's brain pulsed with the maddening rhythm. The red discharge appeared at the projections of the control panels. He forgot the fleet of the Llotta, forgot the menace to his own world. Only Ora mattered now, and he had not the power to save her!

As in a daze he knew he was wrenching mightily at the body of the powerful minion of Rapaju. His fingers encountered heated metal—one of the ray-pistols. He felt the intense vibration of the weapon as its charge was released. But he still lived. The beast who held it had missed! Dimly he was conscious of the screams of Ora; of the yielding of the creature who fought him. An animal cry registered on his consciousness and he shook the suddenly limp Llotta from him. He knew somehow that his last enemy was gone.

A quick glance showed him that Ora was still on her feet, braced against the wall. The red veil was before

his eyes. He grasped the controls, and fought desperately to keep his strength and senses. A streamer of horrid whiteness swung across his vision; slithered clammily over the glass of one of the forward ports. They were into the thing! It was the end! He groaned aloud as he fumbled with the mechanisms and strove to formulate a plan of escape.

The fleet, he knew, was just behind. An enormous mass. The repulsive energy astern would be terrific. He turned it full on. The whiteness obscured his vision. Then it was gone once more. A single streamer waved before him and encompassed them. The movement of these members must be inconceivably rapid, else they'd be invisible at the speed the *Nomad* was traveling. Full speed ahead. The repulsion full on in the direction of the center of the mass as well as astern. The framework of the *Nomad* creaked protestingly from the terrific forces that tore at her vitals.

Then suddenly they were released. The *Nomad* was shooting off into space. The resultant of those combined forces had done the trick. Only the edge of

that devil-fish of space, had they touched. Free—they were free of the monster! The red veil lifted. He rushed to Ora's side. She was kneeling at one of the floor ports, breathing heavily but unharmed.

Below them they saw the swiftly receding mass: the fleet of the Llotta diving headlong, drawn inexorably into the rapacious embrace of the vile creature of the heavens. An instant the awful whiteness of the thing closed in greedily about the many spheres of the fleet; swallowed them from sight and contorted madly and with seeming glee over the triumph. Then, in a burst of blinding incandescence, it was gone. The monster, the fleet—everything—blasted into nothingness. The fuel storage compartments of the vessels of Ganymede had exploded! The heavens were rid of the inexplicable growing menace; the inner planets were saved from a terrible invasion. And the *Nomad* was safe. Ora, Detis, Mado—all were safe!

At his side Ora was trembling. Gently he raised her to her feet, and took her into his arms.

Chapter 10: Vagabonds All

Together they cared for Detis and Mado; made them comfortable in their bunks until the time when the effects of the gas would wear off. Lucky it was that Rapaju had used the gas pistol rather than the ray. Perhaps it had been a mistake. Or perhaps he had needed the scientific knowledge of Detis, the familiarity with the inner planets that was Mado's. At any rate, they had no delusions regarding his designs on Ora or his hatred of Carr. By his own passions had the commander of the fleet been led to the error that cost him his life and made possible the destruction of his fleet.

Carr was torn by conflicting emotions. The delectable little European was most disturbing. He'd never had much use for the other sex—on Earth. Too dominating, most of them. And always thrown at his head by designing parents for his money. But Ora was different! Her very nearness set his pulses racing. And he knew that she cared for him as he did for her. Those moments in the control cabin after the explosion! But something had come over him since he

cut loose from the old life. Wanderlust—that was it. He'd never go back. Neither would he be content to settle down to a domestic life in Pala-dar. Wanted to be up and going somewhere.

"Oh, Carr, Carr!" Ora's voice called to him. "Mado is awake. He wants you."

Good old Mado! Why couldn't they just continue on their way as they had started out? Roaming the universe in search of other adventures! But the silvery tinkle of Ora's laughter reached his ears. She was irresistible! He forgot his doubts as he hurried to his friend's cabin.

Mado was staring at the European maiden with a ludicrous expression of astonishment—gawping, Carr called it. And Ora was laughing at him.

"Your friend," she gurgled, "doesn't believe he's alive, or that I am, or you. Tell him we are."

Carr grinned. Mado did look funny at that. "Hello, old sock," he said, "had a bad dream?"[269]

"Did I? Oh boy!" Mado rocked to and fro, his head in his hands. Then he displayed sudden intense interest. "Rapaju?" he asked. "His guards—the fleet—what's happened?"

"Ah ha! Now you know you're alive!" Carr laughed. "But the others are dead and gone. The fleet's gone to smash—and how!"

"But Carr. How did you do it? Tell me!"

Mado threw off his covers and clapped his friend on the back, a resounding thump that brought a gasp from Ora.

"Your Sargasso Sea did it. And it's a thing of the past, too. Wait till I tell you about it!"

Ora tripped from the room as Carr sat on the edge of the bunk to spin his yarn.

"But man alive!" Mado exclaimed when the story was finished. "Don't you know you've done a miraculous thing? I'd never have had the nerve. That damn

creature out there had more than four times its former attracting energy. That's what made it impossible for the fleet to get away. And you—you lucky devil—you just doped it out right. The fleet of the Llotta gave you a tremendous push from astern when you used the repulsive energy. If they hadn't been there with their enormous mass to react against we'd all have been mincemeat now along with the Llotta. You Terrestrials sure can think fast! Me, now—Lord, if it had been me, I'd have thought of it after my spirit had departed to its reward—or punishment. Glory be! It's the greatest thing I ever heard of."

"Rats! You'd have done the same as I did. Probably would have missed it a mile instead of nearly getting caught as I did. A good thing the fleet's gone, though. Mars and Terra—Venus, too—they'll never know how close it was for them. Wouldn't have sense enough to appreciate it, anyway."

"They would if they ever got a taste of what the Llotta planned. But what's wrong with you Carr? You act sore. Want to go home?"

"Me? Don't be like that. No—I'd like to carry on as we planned. There's Saturn, Uranus and Neptune yet; Planet 9; a flock of satellites and asteroids. Oh, dammit!"

Mado looked his amazement. "Well, what's to prevent it?" he demanded. "The *Nomad's* still here, and so are we. I'm just as anxious to keep going as you are. Why not?"

But Carr did not reply. Why not, indeed? He strode from the cabin and into the control room. The *Nomad* was drifting in space, subject only to natural forces that swung it in a vast orbit around the sun. He started the generators and drove the vessel from her temporary orbit with rapid acceleration. Out—out into the jeweled blackness of the heavens. There was Jupiter out there, a bright orb that came suddenly very near when he centered it on the cross-hairs of the telescope.

The excited voices of Ora and Detis came to his ears. The booming speech of Mado. Why couldn't he be sensible and companionable as they were? But a

perverse demon kept him at the controls. They'd think him a grouch. Well, maybe he was! But the vastness of the universe beckoned. New worlds to explore; mysteries to be solved; a life of countless new experiences! Anyone'd think he was the owner of the *Nomad*, the way he planned for the future.

They were in the control cabin now—Mado and Detis and Ora. A moment he hesitated, eyes glued to the telescope. Then, with a petulant gesture, he reached for the automatic control; locked it. Shouldn't be this way. They'd think him an awful cad. And they'd be right! He whirled to face them.

Detis was smiling. Mado gazed owlishly solemn. Ora clung to the arm of her father, and her long lashes hid the blue eyes that had played such havoc[270] with the emotions of the Terrestrial.

"Carr," said Detis, gently, "we must thank you. You saved our lives, you know."

"Aw, forget it. Saved my own, too, didn't I? By a lucky break."

"It wasn't luck, Carr." Detis was gripping his hand now. "It was sheer grit and brains. You had them both. If you hadn't used them we'd all be corpses—or disintegrated—excepting Ora, perhaps. And you know the fate that awaited her. Instead, we are alive and well. The fleet is gone. Rapaju's body and that of his guard drift nameless in space where you disposed of them through the air-lock of the *Nomad*. The inner planets need fear no future invasion, for the resources of Ganymede have been expended in the one huge enterprise that has failed. All through your quick wit and bravery. No, it wasn't luck."

"Nonsense, Detis." Carr returned the pressure of the scientist's hand, smiling sheepishly. He pushed him away after a moment. He didn't want their gratitude or praise. Didn't know what he wanted. Ora still avoided meeting his gaze. "Nonsense," he repeated. "And now, please leave me. You, Detis. Mado, too. I'd like to be alone for a while—with Ora. Mind?"

Mado's owlish look broadened to a knowing grin as he backed into the passageway. Detis collided with the huge Martian in his eagerness to be out of the room.

They were alone and Carr was on his feet. Nothing mattered now—excepting Ora. Suddenly she was in his arms, the fragrance of her hair in his nostrils.

Star gazing, the two of them. It was ridiculous! But the wonders of the universe held a new beauty now for Carr. The distant suns had taken on added brilliance. Still they beckoned.

"Carr," the girl whispered, after a time, "where are we going?"

"To Europa. Your home."

"To—to stay?"

"No." Carr was suddenly confident; determined. "We'll stop there to break the news. Then we'll be wedded, you and I, according to the custom of your people. Our honeymoon—years of it—will be spent in the *Nomad*, roving the universe. Mado'll agree, I know. Wanderers of the heavens we'll be, Ora. But we'll have each other; and when we've—you've—had enough of it, I'll be ready to settle down. Anywhere

you say. Are you game?"

"Oh, Carr! How did you guess? It's just as we'd planned. Father and Mado and I. Didn't think I'd go, did you, you stupid old dear?"

"Why—why Ora." Carr was stammering now. He'd thought he was being masterful—making the plans himself. But she'd beat him to it, the adorable little minx! "I was a bit afraid," he admitted; "and I still can't believe that it's actually true. You're sure you want to?"

"Positive. Why Carr, I've always been a vagabond at heart. And now that I've found you we'll just be vagabonds together. Father and Mado will leave us very much to each other. Their scientific leanings, you know. And—oh—it'll just be wonderful!"

"It's you that'll make it wonderful, sweetheart."

Carr drew her close. The stars shone still more brightly and beckoned anew. Vagabonds, all of them! Like the gypsies of old, but with vastly more territory

to roam. The humdrum routine of his old life seemed very far behind. He wondered what Courtney Davis would say if he could see him now. Wordless happiness had come to him, and he let his thoughts wander out into the limitless expanse of the heavens. Star gazing still—just he and Ora.

December 1930

#60 Slaves Of The Dust, By Sophie Wenzel Ellis:

Fate's retribution was adequate. There emerged a rat with a man's head and face.

It's a poor science that would hide from us the great, deep, sacred infinitude of Nescience, whither we can never penetrate, on which all science swims as mere superficial film.

—*Carlyle.*

It's a poor science that would hide from us the great, deep, sacred infinitude of Nescience, whither we can never penetrate, on which all science swims as mere superficial film.

—*Carlyle.*

The two *batalões* turned from the open waters of the lower Tapajos River into the *igarapé*, the lily-smothered shallows that often mark an Indian settlement in the jungles of Brazil. One of the two half-breed rubber-gatherers suddenly stopped his *batalõe* by thrusting a paddle against a giant clump of lilies. In a corruption of the Tupi dialect, he called over to the white man occupying the other frail craft.

Fate's retribution was adequate. There emerged a rat with a man's head and face.

"We dare go no farther, master. The country of the Ungapuks is bewitched. It is too dangerous."

Fearfully he stared over his shoulder toward a spot in the slimy water where a dim bulk moved, which was only an alligator hunting for his breakfast.

Hale Oakham, as long and lanky and level-eyed as Charles Lindbergh, ran despairing fingers through his damp hair and groaned.

"But how can I find this jungle village without a guide?"

The *caboclo* shrugged. "The village will find you. It is bewitched, master. But you will soon see the path through the *matto*."

"Can't you stay by me until time to land? I don't like the looks of these alligators."

“It is better for a white man to face an alligator than for a *caboclo* to face an Ungapuk. Once they used to kill and eat us for our strength. Now—” Again his shrug was eloquent.

“Now?” Hale prompted impatiently.

“The white god who put a spell on these one-time cannibals will bewitch us and make us wash and rejoice when it is time to die.”

He shuddered and spat at a cayman that was lumbering away from his *batalõe*.

Hale Oakham laughed, a hearty boyish laugh for a rather learned young professor.

“Is that all they do to you?” he asked.

“No. All who enter this magic *matto* die soon, rejoicing. Before the last breath comes, it is said their bodies turn into a handful of silver dust—poof!—like

that.” He snapped his dirty fingers. “Then the life that leaves them goes into rocks that walk.”

Hale sighed resignedly. There wasn’t any use to argue.

“Unload your *batalõe*,” he ordered testily, “and get your filthy carcasses away.”

The half-breeds obeyed readily. As the departing *batalõe* turned from the *igarapé* into the open water of the river, the young man repressed a sudden lifting of his scalp. He was in for it now!

His long body sprawled out in the *batalõe*, he paddled about aimlessly for several minutes until he found an aisle through the jungle—the path that led to the jungle village which he was visiting in the name of science, and for a certain award.

Before plunging into that waiting tangle where life and death carried on a visible, unceasing struggle, he hesitated. Instinctively he shrank from losing himself in that mad green world.

He had first heard of the Ungapuks at the convention of the Nescience Club in New York, that body of scientists, near-scientists and adventurers linked together for the purpose of awarding the yearly Woolman prizes for the most spectacular addition of empiric facts to various branches of science. One of the members of the club, an explorer, had told a wild yarn about a tribe of Brazilian Indians, headed by Sir Basil Addington, an English scientist, who was conducting secret experiments in biochemistry in his jungle laboratory. The explorer had said that the scientist, half-crazed by a powerful narcotic, had seemingly discovered some secret of life which enabled him to produce monsters in his laboratory and to change the physical characteristics of the Ungapuk Indians, who, in five years, had been transformed from cannibals into cultured men and women.

And now Hale Oakham, hoping to win one of the Woolman prizes, was here in the country of the Ungapuks, entering the jungle path that lead to the unknown.

Fifty feet from the *igarapé*, the path curved sharply away from a giant tree. Hale approached the bend with his hand on his gun. Just before he reached it, he stopped suddenly to listen.

A woman's voice had suddenly broken forth in a wild, incredibly sweet song. Hale stood entranced, drinking in the heady sounds that stirred his emotions like *masata*, the 97 jungle intoxicant. The singer approached the bend in the path, while the young man waited eagerly.

The first sight of her made him gasp. He had expected to see an Indian girl. No sane traveler would imagine a white woman in the Amazon jungle, with skin as amazingly pale as the great, fleshy victoria regia lilies in the *igarapé*.

When she saw Hale, she stopped instantly. With a quick, practiced twist, she reached for the bow flung across her shoulders and fitted a barbed arrow to the string.

She was a beautiful barbarian, standing quivering

before him. In the thick dull gold braids hanging over her bare shoulders flamed two enormous scarlet flowers, no redder than her own lips pouted in alarm. There was a savage brevity to her clothing, which consisted only of a short skirt of rough native grass and breastplates of beaten gold, held in place by strings of colored seeds.

The girl held out an imperious hand and, in perfect English, said:

“Go back!”

Hale drew his long body up to its slim height, folded his arms, and gave her his most winning smile. His insolence added to his wholesome good looks.

“Why?” he exclaimed. “I’ve come a couple of thousand miles to call on you.”

He saw that the eyes which held his levelly were pure and limpid, and of an astonishing orchid-blue.

“Who are you?” Her throaty, vibrant voice was a thing

of the flesh, whipping Hale's senses to sudden madness.

"I'm Hale Oakham," he said, a little tremulously, "a lone, would-be scientist knocking about the jungle. Won't you tell me your name?"

She nodded gravely. "I am Aña. I, too, am white." Her rich voice was quietly proud. "Come; I'll see if Aimu will receive you."

With surprising, childlike trust, she held out her little hand to him. The gesture was so delightfully natural that Hale, grinning boyishly, took her hand and held it as they walked down the jungle path.

"Sing for me," he demanded abruptly. "Sing the song you sang just now."

"That?" asked the girl, turning the virgin-blue fire of her eyes on him. "That was my death-song that I practice each day. Perhaps soon I shall be released from this." She passed her hands over her beautiful, half-clothed body.

Hale's warm glance swept over her. "Do you want to die?"

"Yes; don't you? But you do not, or you would not have retreated from my poisoned arrow."

"No, Aña; I want to live."

"To live—and be a slave of *this*?" Again her hand went over her slim body. "A slave of a pile of flesh that you must feed and protect from the agonies that attack it on every side? Bah! But I am hoping that my turn will come next."

"Your turn for what, Aña?"

"To enter the Room of Release. Perhaps, if Aimu approves of you, you, too, may taste of death." Her gentle smile was beatific.

"Do you speak of Sir Basil Addington?"

"He was called that once, before he came to us. Now he has no name. We can find none holy enough for

him; and so we call him Aimu, which means good friend.” Her beautiful face was sweet with reverence.

And now, in the distance, Hale saw that the path led into a large clearing. He slowed his pace, for he wanted to know this lovely girl better before he joined the Ungapuks.

“Who are you, Aña?” he asked suddenly, bending closer to the crinkled, dull-gold hair.

“I am Aña, a white woman.” She looked at him frankly.

298

“But who are your parents, and how did you get among the Ungapuks?”

Aña’s red lips curved into a dewy smile. “I thought all white men were wise, like Aimu. But you are stupid. How do you think a white woman could appear in a tribe of Indians who live in the jungle, many weeks’ journey from what you call civilization?”

Hale looked a little blank and more than a little disconcerted.

“I suppose I am stupid,” he said dryly. “But tell me, Aña, how did you get here?”

“Why,” she exclaimed, “he made me!”

“Made you? Good Lord! What do you mean?”

“Just what I said, Hale Oakham. If he can take a few grains of dust and make a shoot that will grow into a giant tree like yonder monster itauba, don’t you think he can create a small white girl like me?” Her orchid-blue eyes glowed innocently into his.

The eager questions that he would have asked froze upon his lips, for a party of Indians approached.

The six nearly naked red men came close and surveyed him, toying nervously with their primitive, feather-decorated weapons.

A tall, handsome young fellow who possessed

something of the picturesque perfection of the North American plains' Indian stepped forward and, in perfect English, said:

"Good morning, white stranger. What is it you wish of the Ungapuks?"

"I came to see your white *cacique*," said Hale.

"Aimu? What is it you wish of Aimu? He is ours, white stranger."

"Yes, he is yours. I come as a friend, perhaps to help him in his great work."

"Perhaps!" The young Indian folded his bronze, muscular arms over his broad chest and continued his cool survey of Hale. "White men before you have come: spies and thieves. Some we poisoned with curari. Others Aimu took into the Room of Release."

He turned to Aña, who was still standing by Hale, and his expression softened.

“What shall we do with him, Aña?” he asked the question, a fleeting look of hunger swept his fine, flashing eyes.

Aña flushed beautifully, and, moving closer to Hale, with an impulsive, almost childish gesture, slipped her arm through his.

“Let us take him to our village, Unani Assu!” she suggested. “I like him.”

It was Hale’s turn to flush, which he did like a schoolboy.

Unani Assu’s brows drew together in a scowl. The hand holding his blow-pipe jerked convulsively.

“Aña! Come away!” he growled. “You mustn’t touch a stranger!”

Aña’s blue eyes stretched with astonishment. “But I like to touch him, Unani Assu!”

The tall Indian, with a half comical gesture of despair,

said:

“Don’t misunderstand her, stranger. She is young, very young, ah! And she has known only the reborn men of the Ungapuks.”

He stepped firmly over to Aña, and, taking the girl by the arm, drew her away.

“Run ahead,” he commanded, “and tell Aimu that we come.”

Aña, her feathered bamboo anklets clicking together, sped away.

Unani Assu bowed courteously to Hale.

“Come, stranger. If you are an enemy, it is you who must fear.” He motioned for him to proceed down the jungle path.

The path ended at a clearing studded with *moloccas*, the Indian grass huts made of plaited straw.

Altogether the scene was peaceful and sane and far

removed from the strange tales that Hale had heard concerning the Ungapuks.

Hale was conducted to a long, low stone building, where, in the doorway, stood a tall and emaciated white man.

“Aimu!” said the Indians reverently, and bowed themselves.

Over the bare, brown backs, the white man looked at Hale.

“Sir Basil Addington?” asked the young man.

“Yes. You are welcome. Come in.”

Hale entered the building.

He was in a book-filled study, furnished with hand-made chairs and a desk. Sir Basil asked him to be seated. He offered the young man long, brown native

cigarettes and a very good drink made from yucca.

After several minutes of conversation, Sir Basil suddenly changed his manner.

“And now,” he shot out, eyeing the young man through narrowed lids, “will you please state the purpose of this visit?”

Hale looked squarely at his questioner. “Frankly, Sir Basil, I have called on you because I am so intensely interested in your work among the Ungapuks that I wish to offer my services.”

He gave in detail his family history, his education, and his experience as a teacher and a scientist.

Sir Basil tapped his teeth thoughtfully with a pencil.

“But why do you think you can be of assistance to me?”

“That, of course, is for you to decide.”

Hale thought that the scientist looked like a huge, starved crow in his loose-fitting coat. He was so fleshless that, when the light fell strongly on his face as it now did, the bones of his head and hands showed through the skin with horrible clearness.

Hale, under Sir Basil's scrutiny, decided instantly that he did not like him.

"I need a helper," the scientist went on, with the air of talking to himself. "A white assistant who neither loves nor fears me. Unani Assu is good enough in his way, but I need a helper who has had technical training." Suddenly he wheeled on Hale and asked sharply, "How are your nerves, young man?"

Hale started, but managed to answer calmly.

"Excellent. My war record isn't half bad, and that was surely backed with good nerves."

"And you say you have no close relatives, no ties of any sort to interfere with work that is dangerous—and something else?"

“Not a soul would care if I passed out to-day, Sir Basil.”

“Good! And now tell me this: are you one of those scientists whose minds are so mechanical, so mathematically made, as it were, that your entire outlook on science is based on old, established beliefs, or do you belong to that rare but modern type of trained thinker and dreamer who refuse to permit yesterday’s convictions to influence to-day’s visions?”

Hale smiled quietly. “I recently lost my chair in a famous university because of my so-called unscientific teachings regarding ether-drift.”

Expressing himself in purely scientific terms, he went into an elaboration of his revolutionary theory. When he had finished, Sir Basil reached out his clawlike hand to him.

“Good!” he approved. “You have dared to think originally. Now listen to my theory of mind-electrons which has grown into the established fact that I have discovered the secret of life and death.”

The long, thin hands reached into a pocket for a box of pills. He swallowed one greedily, and immediately his emaciated face seemed charged with new virility.

He spoke out suddenly. "Our world, you know, is made up of three powers: matter, energy and what you call life. I might really say that there are but two powers, for matter, in its last analysis, is a form of energy. And what is life? You can't call it a form of energy, for every inorganic atom has 300 energy without having life. Life, Mr. Oakham, is mind or consciousness."

He began pacing the floor restlessly. "Everything that lives has this consciousness, and I say this in defiance of some fixed scientific views. The amoeba in a stagnant pool, a thallophyte on a bit of old bread, any of the myriads of trees and plants that you see in the jungle all have consciousness as well as you. And why?"

He brought his fist down upon the table. "Because they issue from the same source as you and I, the almighty mind, eternal, indestructible, which has permitted itself to be enslaved by matter. You are

Hale Oakham. I am Basil Addington, yet we are one and the same. Let me illustrate.”

He seized a glass and poured it full of *masata*. “Look! Two portions of *masata*. But I pour what is in the glass back into the bottle. The molecules cohere and the two portions become one again. Some day you and I—our individual consciousnesses—will flow back to the Whole. That sounds mystical, but listen.

“We scientists hold that the electron explains nearly all the physical and chemical phenomena. I go further and say that it explains *all*. Matter, electricity, light, heat, magnetism—all can be reduced to the ultimate unit. So, Mr. Oakham, I am going to make clear to you how life itself is electronic.”

His long finger touched Hale’s arm. “You, I, yonder mosquito on your sleeve, even one of the germs that is causing my malaria, all being individual living things, are the ultimate units of what I shall personify as the Mind. When I say *you* I do not speak of that mound of flesh in which you exist, and which can be reduced to the same familiar basic elements and

compounds as make up inorganic structures; I speak of your mind, your consciousness—for that is the real you. Are you following me?”

“Perfectly, Sir Basil.” Hale reached for another drink. “But do you mean to say that you and I are no more than a mosquito, a malaria protozoan, or even one of those trees in the jungle?”

Sir Basil’s dry skin slipped back into a long smile. “Startling, isn’t it? You, I, and all other living organisms are nothing but matter, energy and consciousness. You and I have a larger share of consciousness, because our organic structure permits the mind-electrons greater freedom over the matter than composes our bodies. We are more acutely aware of the universe about us, have a greater facility for enjoyment and suffering, a more intricate brain and nervous system. Yet when our bodies die and our consciousness is released, the mind-electrons enslaved by our atoms go back to the elemental Whole. This holds good for the protozoan, the tree, the man—for all things that live.”

Hale was drinking again. "You mean, Sir Basil, that there is a sort of war waged against what you personify as the Mind by matter; that matter is constantly seeking to enslave mind-electrons, so that it may become an organism which, for awhile, may enjoy what we call life?"

Sir Basil pushed back his tufted hair and looked happy. "Yes! And it's Nature's supreme blunder! In the end, the Mind always conquers and gains its release, yet the eternal chain of enslavement goes on and on, and will continue to go on as long as there is a living organism in the world to bind mind to matter."

Hale was excited now, as much from the fiery intoxicant as from the scientist's weird revelation. "I get you," he said, rather inelegantly for a professor. "You mean that if every living thing in the world should pass out, every man, every plant, every animal, even down to microscopic infusoria, the Mind would collect all its electrons, and through some more jealous law of, er, cohesion hold these electrons inviolate from matter and energy?"

“Right! And again, as in the beginning, the Mind would rule supreme. By what I have proved, you and I and all other creatures that now have life may, as separate unfleshed electrons, enjoy eternal consciousness as a part of the Mind.” A new passion leaped to his dark eyes. “When I have finished my mission, no more need we be slaves of the dust, subject to all the frightful sufferings of this dunghill of flesh.”

He brought his fist down upon his skinny leg with a resounding blow.

“But you cannot reduce your theory to fact, Sir Basil!”

“No?” Again came that frightful grin to his cadaverous face. “Can you withstand shock?”

“If you mean shock to the eye, let me remind you that I served two years in the big fight.”

“Then come to my laboratory. Better take another drink.”

While Hale helped himself again from the *masata* bottle, Sir Basil swallowed another pellet.

Then the two went into the adjoining apartment.

Sir Basil, his hand over the doorknob, paused.

“Before we go in,” he said, “I want you to remember that we call natural that which is characteristic of the physical world. Everything alive in this laboratory was produced by nature. I merely made available the materials, or, rather, I made the conditions under which matter was able to enslave mind-electrons.”

He opened the door, slipped his body through, and, with his ugly, teeth-revealing grin, gestured for Hale to follow him.

Hale steeled himself and looked around half fearfully. The first glance took in a large and well-equipped laboratory, somewhat fetid with animal odors. The second lingered here and there on cages, aquariums,

incubators, and other containers where creatures moved.

Suddenly, as something scuttled across the floor and disappeared into a hole in the wall, Hale cried out and covered his eyes with a hand.

Sir Basil laughed aloud. “Why didn’t you examine it closer?”

Hale looked nauseated. “My God, Sir Basil! A rat with a man’s head and face!”

Sir Basil’s voice was sharp, decisive. “Before you leave this laboratory, you’re going to come out of your foolish belief that man is a creature apart from other living organisms. You—the conscious you—is no greater, no more important in the final balance than the spark of consciousness in that rat. When your body and the rat’s body give up their atoms to nature’s laboratory, the little enslaved mind-electron that is you and the one that is the rat will be identical.”

Again Hale shivered and turned away from that cold, too-thin face.

The scientist was speaking. "Step around to all those cages and pens. I want you to see all my slaves of the dust."

But long before Hale had encircled the room, he was so disturbed at what he saw that he could scarcely complete his frightful inspection. In every enclosure he viewed a monstrosity that in some way resembled a human. Every reptile, every insect, every queer, misshapen animal not only looked human in some shocking manner, but also seemed to possess human characteristics. It seemed as though some demented creator with a perverted sense of humor had attempted to mock man by calling forth monsters in his image.

At last the young man cried out: "How did you breed these freaks?"

"They are not freaks, and I did not breed them. They are nature's parentless products whose basic

elements were brought together in this laboratory, and, by a scientific reproduction of the functions of creation, endowed with the life principle, which is merely 302 mind-electrons." He smoothed his long tuft of hair nervously. "Would you like to see how life springs from a wedding of matter, energy, and consciousness?"

"I suspect I can stand anything now," Hale admitted.

"Then come and peep into a very remarkable group of apparatus I have developed, where you can watch atoms building molecules and molecules building living organisms."

"You say I can see atoms?"

"Not directly, of course. The light waves will forever prevent us from actually seeing the atom. But I have perfected a system of photography which magnifies particles smaller than light waves, and, separating their images from the light waves, renders detail clear in the moving pictures."

He went to a huge machine or series of machines which took up all the center floor space of the laboratory, where he busied himself in an intricate network of wires, mirrors, electrodes, ray projectors, and traveling metal compartments. Presently he called out to Hale.

“Let me remind you, Oakham, that while any scientist can break up any of the various proteid molecules which are the basis of all living cells, animal and vegetable, no scientist before me has been able to compound the atoms and build them into a proteid molecule.”

He bared his teeth in the smile that Hale hated.

“I am proud to tell you that the proteid molecule can be built up only when the third element of nature’s trinity is added—the mind-electron. I have found a means of capturing the mind-electron and of bringing it in contact with proteid elements. And now it is possible to bring forth life in the laboratory. Come closer and watch proteid forming protoplasm, protoplasm forming a cell, and the cell evolving into—

well, what do you want, an animal, plant, or an insect?”

Hale had fallen under the scientist’s spell. He did not feel foolish when he said:

“Let’s have a rat!”

Hale became so absorbed in the wonders of the laboratory that when lunch time came, Sir Basil had food brought to them. While they were eating a very good vegetable stew, farina, and luscious tropical fruits, a sudden, agonized scream rang out, followed by other screams and wails.

Sir Basil opened the door and looked out. Aña came running forward. Her blue eyes were flooded with tears.

“Oh, Aimu!” she moaned. “A tree fell on Unani Assu.”

She buried her beautiful face in her hands and sobbed aloud.

Sir Basil frowned heavily.

“I can’t lose Unani Assu yet,” he declared. “He is a wonderful help around the laboratory. Is he dead?”

“No. We should rejoice if his time of release had come. But his legs, Aimu! No one wants to suffer and be crippled.”

Even in her distress, the girl’s voice was rich and vibrant, and every tone moved Hale curiously.

“Hurry!” cried the scientist. “Have them bring him here before he dies.”

The girl leaped to her feet and sped away.

“Come, Oakham,” continued Sir Basil. “Here is a rare opportunity for you to see how completely I have mastered the laws that govern organic matter. Help me prepare.”

For several minutes, Hale worked under the scientist’s sharply spoken directions. By the time the

injured man was brought to the laboratory, Sir Basil was ready for him.

Unani Assu was still conscious, but his pale face indicated that he had lost much blood. When the improvised stretcher was lowered to the floor, Sir Basil sent all the Indians away.

Unani Assu opened his eyes and called feebly, "Aña!"

303

"Be still!" ordered Sir Basil. "Aña is not here."

"Please!" gasped the dying man. "I want her—my Aña!"

Sir Basil sucked in his breath sharply. "What's this? Have you been making love to Aña again, after my warning to you?"

The sufferer stirred uneasily. "No!" he panted. "But perhaps my hour of release has come, and I want to look at her—once more."

The scientist smiled unpleasantly as he eyed the magnificent body which looked like a broken statue in bronze.

“Some human characteristics are strange,” he muttered. “In spite of everything I do, this fellow continues to love Aña: Aña whom I intend for myself.”

He stepped to the apparatus and swiftly changed one of the adjustments.

“Perhaps,” he resumed, with a gleam in his eyes that chilled Hale, “this will forever cure him.”

In another moment, the still, half-dead body was lifted and gently slipped into a compartment.

Before Hale’s horrified gaze fastened on the eye-piece which revealed moving pictures of every process that went on within, Unani Assu’s body was reduced almost instantly to a fine, silvery dust.

“Good God!” he cried. “You have killed him.”

The scientist's teeth showed in his wide smile. "Think so? Does a woman destroy a dress when she rips it up to make it over?"

"Do you mean me to understand that you can reduce a living body to its basic elements and then rebuild these elements into a remade man?"

"Watch!" warned the scientist.

Hale looked again and saw the silver dust that was once a living body being whirled into a tiny, grublike thing. He saw the grub expand into an embryo, and the embryo develop into a foetus. From now on the development was slower, and he often stopped to talk with Sir Basil.

Once he asked: "If this man had died naturally, could you have brought him back to life?"

Sir Basil shook his head. "No. When once the mind-electron is completely freed from its enslavement by matter, it is forever beyond recall by the body it has just vacated. Like atomic electrons, whose

equilibrium disturbed break away from their planetary system and go dashing off into space, only to be drawn into another planetary system, the mind-electron may be enslaved almost immediately by extraneous matter. Had Unani Assu died, his liberated mind-electron might at once have been captured by a jungle flower going to seed. Immediately a new seed would be started. And now the former Unani Assu would be a seed of a jungle flower, later to find new life as a plant.”

Suddenly the scientist threw up his hand and cried: “You see? The Mind will be eternally enslaved as long as there is life! Oh, for the time of deliverance!” He gazed fanatically into space, as though he dreamed magnificently.

Hale observed him thoughtfully. When that great brain weakened, the consequences would be frightful.

Sir Basil, as though he had made a sudden decision, went over to that part of his machine which he called the molecule-disintegrator.

“Oakham!” he called out. “I have taken you partly into my confidence. Now I want to show you something. Come here.”

Hale obeyed with misgivings. The scientist pointed out the window to a group of Indians, anxious relatives of Unani Assu.

“Watch!” he ordered.

Turning one of the projectors on the machine toward the window, he sighted carefully and pressed a button.

Immediately one of the Indians fell to the ground and struggled. His companions 304 began dancing around him in evident joy. Faintly to the laboratory came a familiar chant, which Hale recognized as Aña’s death song.

Dust to dust
Mind to Mind—
He will shed his body
As the green snake sheds his skin.

As Hale watched, the struggling Indian's body seemed to shrink, and then, instantly, it disappeared.

"Watch them scatter the dust!" said the scientist.

One of the Indians stooped and blew upon the grass.

"What have you done!" Hale gasped. "You've killed this one. Oh, I see now! These poor devils are totally ignorant that you are killing them for practice. They worship you while you turn them to—silver dust!" He turned angrily on the scientist as though he longed to strike him.

"Keep cool, young man!" Sir Basil held up his fleshless hand. "There is no death! Change, yes; but no permanent blotting out of consciousness. Can't you see the horror of it as nature works? When your time for release comes, as it inevitably will, your mind-electron might find new enslavement in a worm!"

Hale's reply came hotly. "If that is true, why do you murder these poor devils deliberately!"

“My dear Oakham, perhaps you are not so brilliant as I had hoped! All that I have done thus far is only child’s play, in preparation for my real work. Haven’t you guessed by now what I am getting ready to do?”

“No; I’m a poor guesser.”

The scientist made a gesture of mock despair. “Then let me tell you. The molecule-disintegrator is active only on organic structures. When I concentrate it so”—he reached out again, sighted the projector on some point beyond the window and pressed a button —“one single living organism passes out. See that jupati tree by the rock disappear?”

Before Hale’s eyes, the tall, slender tree melted into air.

“But,” continued Sir Basil, “if I should *broadcast* my molecule-disintegrator on electron magnetic waves, destruction would pass out in all directions, following the curve of the earth’s surface, penetrating earth, air, water.” He wet his lips carefully. “You understand?”

Hale stiffened suddenly. "I understand. No life could survive these vibrations of destruction? Through every corner of the earth where life lurks, they would reach?"

"Yes!" cried Sir Basil. "There would be not a blade of grass, not a living spore, not a hidden egg! Think of it, Oakham! No more would the clean air and the sweet earth reek with life, and at last the ultimate mind-electron would be released forever."

He was breathing fast, and his emaciated face burned with two red spots.

Hale thought rapidly. He was convinced now that the fate of all life lay within that diabolical network of chemical apparatus.

At last he said: "And what of you and I, Sir Basil? Shall we, too, be caught in this wholesale destruction?"

"Not immediately," replied the scientist. "Of course, I want to remain in the flesh long enough to be sure

that my purpose has been accomplished. I have provided a way for my own safety. If you desire, you may remain with me.” He smiled craftily. “I have planned to keep Aña also, the woman whom I called into life and made as I wished.”

His words pounded against Hale’s tortured ears with almost physical force. With a supreme effort, the young man controlled his rage and despair. Aña needed him too much now for him to risk defeat by showing his emotions.

To Sir Basil he said: “But if all life disappears from the earth, what shall we do for food—you, Aña, and I?”

Sir Basil lifted his brows. “You don’t think I overlooked that, do you? What is food? Various combinations of the basic elements. I who have conquered the atom need never worry about starving to death.”

All this time, the machinery had been humming, and now the humming changed its note to a shrill whistle.

Sir Basil went to the eye-piece and looked into it. Opening a door in the machinery, he disappeared inside. He came out soon, flushed and evidently elated.

“Bring the stretcher, Oakham,” he ordered.

Hale brought the stretcher, placing it close to the machine. Then Sir Basil opened a metal door and gently eased out a human body.

It was Unani Assu, unconscious but alive and breathing. Hale, helping the scientist to get the man on the stretcher, noticed that the crushed legs were perfectly healed. Together they bore him to a long seat. The Indian’s eyes were still closed, but his even breathing indicated that he was only sleeping.

Suddenly Hale pointed a finger and cried out. “My God, Sir Basil, look at his hands and feet!”

Unani Assu, still lying like a recumbent bronze statue sculptured by a master, was perfect from shoulder to wrist, from thigh to ankle. But, somewhere in that

diabolical machine through which he had passed, his hands and feet had undergone a hideous metamorphosis which had transformed them from the well-formed extremities of a splendid young Indian into the hairy paws of a giant rat!

Hale turned away his head, sick with disgust.

Sir Basil cut the silence triumphantly:

“Now he’ll never again face Aña with love in his eyes!”

“What!” broke in Hale. “Did you plan this monstrous thing?”

“Of course! I told you I should forever cure him of his mad infatuation.”

“But why didn’t you kill him, as you killed the others? It would have been the most merciful way.”

Sir Basil showed his teeth in his ugly smile. “A creator is never merciful.”

A quiver passed through the Indian's body and presently, he sighed deeply and opened his eyes. He seemed dazed, puzzled. He looked from Hale to the scientist, and turned seeking eyes to other parts of the laboratory.

"Aña!" he called weakly. "Where is Aña?"

He pulled himself a little unsteadily to his feet—to the spatulated, hairy *rodent* feet that had come out of the life-machine. Staggering, he would have fallen, had he not thrown out his arm to steady himself. Instinctively he tried to grasp something for support, and then, for the first time, he discovered his deformity.

Hale was never to forget that expression of horror and disgust that swept over the Indian's face as he spread open his revolting extremities and stared at them.

A sudden, wild roar of despair rang through the room. "Aimu! My hands!"

The scientist smiled with evident amusement. "You are a grotesque sight, Unani Assu. Do you want to see Aña now?"

The fright and horror faded from the Indian's face, for now he glared with hate into the mad, mocking eyes.

"You did it!" the Indian ground out. "You've made me into a thing from which Aña will run screaming."

Through the quiet rage of the perfectly spoken English ran a thread of sorrow. "Aimu, whom we considered too holy to name!"

Choking, he hobbled away to the door, which he unbolted. As he passed out into the open, Sir Basil went over to the machine and began sighting the projector which cast forth the ray of destruction.

"No!" cried Hale. "You've done enough murder for to-day."

The scientist paused. "I was trying to be merciful. And then, I wonder if it is safe to let him go, hating me?"

Oh, well!" He shrugged his narrow shoulders. "I seldom leave the laboratory, and certainly nothing can harm me here." He touched the death-projector significantly.

Hale made a mental decision. "I must find out how the damned thing works and put it out of commission."

With this determination uppermost in his mind, he assumed a more intense interest in the strange laboratory. For the next two days, he assisted Sir Basil so assiduously that he learned much about the operation of the life-machine. And gradually he stopped being horrified as the fascination of producing life in the laboratory grew upon him.

After he had assisted the scientist in building living organisms from basic elements, he ceased to cringe when he remembered that perhaps it was true that Aña was created in the mysterious life-machine.

Once the scientist declared, "She is untainted with

inheritance. She is the perfect mate that I called into life so that before I pass from the flesh I may taste that one human emotion I've never experienced—love.”

That very night Hale kept a secret tryst with Aña after the village slept. Sweet, virginal Aña, who knew less of the world than a civilized child of twelve—what a sensation she would create in New York with her beauty, her culture, her natural fascination! With her in his arms and an orange tropical moon hanging low in the hot, black sky, he ceased to care that she had no ancestors, for now his one passionate desire was to save her from Sir Basil and to hold her forever for himself.

He might have been content to go on like this for months, tampering with creation in the day time, courting Aña in secret at night, had not Unani Assu come back for revenge.

On the fourth night after Unani Assu had disappeared into the jungle, Hale went to the *igarapé* to meet Aña. He had gone only half the distance when he

encountered her, running frantically up the path toward him.

“Hale!” she gasped, falling into his opened arms, where she lay panting and exhausted.

Hale gently patted the long braids, shimmering in silver tangles under the moonlight, and, crushing the soft little trembling body close, he murmured:

“What’s the matter, darling?”

She dug her face deeper into the bend of his arm.

“Oh, Hale! I saw Unani Assu a few minutes ago.” For several moments she was unable to go on, for sudden sobs cut off her breath. “It’s terrible, Hale, what Aimu did to his hands and feet, but what Unani’s going to do to Aimu is still more terrible.”

Hale placed his hand gently under her chin and tilted up her small, pale, tear-drenched face.

“Be calm, Aña, and tell me plainly.”

Still clinging to him, she went on. "He told me that Aimu is a devil, Hale. He showed me his hands and asked me if I could ever get used to them and be—his squaw." The round gold breastplates and the necklace of painted seeds clinked together over her panting bosom. "I told him about you, Hale. And then he seemed to go mad. He said he'd kill Aimu to-night."

"But, Aña! Why did he let you go, knowing that you would give the alarm?"

"He didn't let me go." Her petaled lips parted in a faint smile. "I escaped. Unani Assu tied me to a tree by the *igarapé*. Because he doesn't ... hate me, he could not bear to tie me too tightly."

"Then he must be close to the laboratory now. If he breaks in upon Aimu—oh, my God!"

Hale remembered the death-projector. If Sir Basil were in danger of attack, he would not hesitate to touch the 307 waiting button that would broadcast death throughout the world.

He seized Aña's little hand and cried out: "Run, Aña! The only safe place now is Aimu's laboratory. Run!"

As they dashed on madly, Hale opened wide his nostrils to scent the heavy, flower-laden air of the jungle. Any moment all this sweet, rich life might vanish instantly. He had a horrible vision of a world devoid of life, a world of bare rocks, dry sand, odorless, dead waters. For it was life that greened the landscape, roughened the stones with moss and lichen, thickened the ocean with ooze, and turned the dry sand into loam—life that swarmed underfoot, overhead, all around!

And now, just as they reached the laboratory door, panting and frantic, a hoarse shriek broke forth. Dragging Aña after him, Hale dashed forward, conscious of two masculine voices raised in passion.

The door to the room where the life-machine performed its vile work was locked. Hale pounded against it and called out to Sir Basil, but only curses and the sound of tumbling bodies came from beyond the door. Although originally the door had been thick

and strong, the destructive forces of the tropics had pitted and rotted the wood. A few blows of Hale's shoulder broke it down.

Under the brilliant electric light, Sir Basil and Unani Assu were fighting upon the blood-spattered floor. The struggle was uneven: the scientist's emaciated body was no match for the splendid strength of the young Indian.

"Help Aimu!" cried Aña, pushing Hale forward.

Aimu was being choked to death.

Hale acted fantastically but efficiently. Catching up a bottle of ammonia, he moistened a handkerchief and clapped it against Unani Assu's nose. Instantly the Indian choked, released Sir Basil, and fell back, gasping for breath.

Hale thrust the handkerchief into his pocket.

"Get out!" he ordered Unani Assu. "Quick!" He threatened him with the ammonia bottle.

But Unani Assu was not looking at the bottle. “Aimu!” he screamed, pointing.

When Hale saw and understood, he leaped across the room to plant his body in front of Aña; for Sir Basil was behind the life-machine, reaching for the controls of the ray projector.

Suddenly, from behind Hale, a silver streak shot across the room. Sir Basil groaned and sank to the floor of the laboratory.

A keen-bladed dissecting knife, thrown by Aña, stuck out from his left breast.

Aña ran forward, sobbing wildly. “Oh, Aimu! I’m sorry! I didn’t mean for it to strike you there. Only your hand, Aimu! I didn’t want Hale to die, Aimu. I didn’t—oh!”

She was on her knees by the scientist’s side, his head held in her slender arms.

“He’s breathing!” she rejoiced. “Some *masata*, Hale,

quick!”

Hale found a bottle of good brandy which he had contributed from his own supplies. Soon Sir Basil gasped and opened his eyes. He stared about him wildly, then gasped:

“I’m dying, Hale Oakham! Quick, the life-machine, before my mind-electron escapes.”

He tried to pull his body up, but fell back, weak and panting.

Hale hesitated, looking doubtfully at Aña.

“For God’s sake, quick!” screamed Sir Basil. “I’m dying, I say! I must have—rebirth. Lift me to the disintegrator. Hurry!...” His voice trailed off faintly.

“He is dying,” snapped Hale. “We might as well try it.” He jerked open the door to the disintegrator. “Here, Unani Assu! Lend a hand!”

Instantly the Indian came forward, a peculiar, pleased

expression on his handsome face. In a moment, Sir Basil's body was inside, and the machine began its weird humming, the humming that indicated the transformation of a human body into dust.

"Now!" cried Unani Assu exultingly, going behind the machine. "I have helped him enough to understand that if one changes this—and this—and this"—he made some rapid adjustments on the machine—"something that is not pleasant will happen."

"Stop!" cried Hale. "What did you change?"

The Indian laughed mockingly. "Wouldn't you like to know? But, yet, you should not worry. You have no cause to love him, have you?"

"I can't be a traitor, Unani Assu! Arrange the machine as it was originally, and I give you my word of honor that when Sir Basil comes out, I'll wreck the damned thing beyond repair. See, Unani Assu? You and I together will smash it."

The Indian folded his arms so that the repulsive

things that should have been hands were hidden.

“It’s too late now,” he admitted, shaking his head.

“Yet I’ve done no more to him than he did to me.”

Hale went to the eye-piece in the machine and started to look inside. Unani Assu stepped forward, tapped him on the shoulder, and, fingering significantly the dissecting knife which he had picked up, said:

“I am operating the machine. Will you sit over there by Aña and wait? It won’t be long. And, white stranger, remember this: I am your friend. I am turned against none but our common enemy.” He pointed significantly to the machine.

Two hours passed, long, silent hours for the watchers in the laboratory. Aña fell asleep, in a sweet, childish bundle upon the piled cushions, her golden hair, still decorated with the red flowers which she always wore, crushed and withered now. Several times Hale caught Unani Assu gazing at her sadly, and his own look saddened when it rested on the Indian’s strong, outraged body.

The humming of the machine changed to a whistle. Placing his fingers on his lips in a signal of quiet, Unani Assu whispered:

“Let Aña sleep. She mustn’t see this.”

Opening a door in the machine, his handsome face lighted with a grim smile, he whispered exultingly:

“Watch!”

A scuttling sound issued forth and then, half drunkenly, an enormous rat tumbled out—one of those horrible rats with the hairless, humanlike faces that had so frequently come from the life-machine.

Hale could not crush back the cry that issued from his throat.

“Where is Sir Basil?” he gasped.

“There!” cried the Indian, pointing to the kicking rat, which was fast gaining strength.

Hale staggered back. “No! You don’t mean it, do you?”

Unani Assu turned the rat over with a contemptuous toe. “Yes, I mean it. Behold Aimu, the man who thought himself creator and destroyer—the man who said that a human being was no higher than a rat! Perhaps he was right, for see this thing that was once a man!”

Hale buried his face in his hands. “Kill it, Unani Assu! Kill it!”

Unani Assu’s low laugh was metallic. “You kill it.”

Hale uncovered his face. “Open the disintegrator.” Gingerly he reached for the rat’s tail.

But his hand never touched the animal. The hairless face turned for a second, and the little, beady eyes blinked up at Hale with an expression that his fevered imagination thought almost human. Then, like a dark shadow, the rat dashed away. Once around the room it scampered, hunting for an exit. Hale started in

pursuit. He was almost upon the animal again, when, leaping up from his grasp, it landed on a low shelf where chemicals were stored. Several bottles fell, filling the room with fumes.

Another bottle fell, and, suddenly, amid a thunderous roar, the ceiling and walls began falling. Some highly explosive chemical had been stored in one of the bottles.

Hale was thrown violently against the couch. His hand touched Aña's body. One last shred of consciousness enabled him to pick her up and drag her out. In the open, he fell, aware, before blackness descended, that flames leaped high over the laboratory building and that Unani Assu lay dead within.

Hale and Aña, leaning over the deck-rail of a small steam launch, gazed into the dark waters of the Amazon.

"We ought to reach Para by morning," said Hale, "and then, dearest, we're off for New York!"

Aña, wearing one of the first civilized dresses she had ever donned, and looking as smart as any débutante, slipped her little hand into her husband's.

"Isn't it a shame, Hale," she moaned, "that the fire burned all the animals and insects, the machinery, and even your notes?" Her beautiful face saddened. "Just one or two specimens might have been proof enough for your What-You-Call-It Club!"

"The Nescience Club, darling. No, I can't expect to win the Woolman prize, but I've won a prize worth far more." He squeezed her little hand and looked devotedly into her blue eyes. "And, Aña, I've reasoned out something concerning mind-electrons which even Sir Basil overlooked."

"What is it, Hale?"

"He maintained that matter seeks always to enslave mind-electrons, but I am convinced that mind-electrons seek to enslave matter.

Understand? It's creation, Aña! Had Sir Basil succeeded in broadcasting death throughout the

world, the freed mind-electrons, as in the beginning, would have started again to vitalize inorganic atoms. And, in a few million years, which is no time to the Mind, the world would be humming with a new civilization. Large thought, eh, sweetheart?"

#61 The Sea Terror, By Sterner St. Paul Meek:

The trail of mystery gold leads Carnes and Dr. Bird to a tremendous monster of the deep.

Aproximate word count: 11,200

Bigotry:

Warnings:

hung over the ship

- - -

“I beg your pardon, sir. I’m looking for Dr. Bird.”

The famous Bureau of Standards scientist appraised the speaker rapidly. Keen blue eyes stared questioningly at him from a mahogany brown face, criss-crossed with a thousand tiny wrinkles. The tattooed anchor on his hand and the ill-fitting blue serge suit smacked of the sea while the squareness of his shoulders and the direct gaze of his eye spoke

eloquently of authority.

“I’m Dr. Bird, Captain. What can I do for you?”

“Thank you, Doctor, but I’m not a captain. My name is Mitchell and I am, or was, the first mate of the *Arethusa*.”

“The *Arethusa*!” Operative Carnes of the United States Secret Service sprang to his feet. “You said the *Arethusa*? There *were* no survivors!”

“I believe that I am the only one.”

“Where have you been hiding and why haven’t you reported the fact of your rescue to the proper authorities? Tell the truth; I’m a federal officer!”

Carnes flashed the gold badge of the Secret Service and an expression of anger crossed Mitchell’s face.

“If I had wished to talk to an officer I could have found plenty in New York,” he said shortly. “I came to Washington in order to tell my story to Dr. Bird.”

The seaman and the detective glared at one another for a moment and then Dr. Bird intervened.

“Pipe down, Carnes,” he said softly. “Mr. Mitchell undoubtedly has reasons, excellent reasons, for his actions. Sit down, Mr. Mitchell, and have a cigar.”

Mitchell accepted the cigar which the doctor proffered and took a chair. He lighted the weed and after another glance of hostility toward the detective he pointedly ignored him and addressed his remarks to Dr. Bird.

“I have no objection to telling you why I haven’t spoken earlier, Doctor,” he said. “When the *Arethusa* sank, I must have hit my head on something, for the next thing I knew, I was in the Marine Hospital in New York. I had been picked up unconscious by a fishing boat and brought in, and I lay there a week before I knew anything. When I knew what I was doing I heard about the loss of my ship and was told that there were no survivors, and I didn’t know what to do. The story I had to tell was so weird and improbable that I hesitated to speak to anyone about

it. I was not sure at first that it was not a trick of a disordered brain, but since my head has cleared I am convinced of the truth of it ... and yet I know that it *can't* be so. I have read about you and some of the things you have done, and so as soon as I was able to travel I came here to tell you about it. You will be better able to judge than I, whether what I tell you really happened or was only a vision."

Dr. Bird leaned back in his chair and put the tips of his fingers together. Long, tapering fingers they were, sensitive and well shaped, though sadly marred by acid stains. It was in his hands alone that Dr. Bird showed the genius in his make-up, the artistry which inspired him to produce those miracles of experimentation which had made his name a household word in the realm of science. Aside from those hands he more resembled a pugilist than a scientist. A heavy shock of unruly black hair surmounted a face with beetling black brows and a prognathous jaw. His enormous head, with a breadth and height of forehead which were amazing, rose from a pillar-like neck which sprang from a pair of

massive shoulders and the arching chest of the trained athlete. Dr. Bird stood six feet two inches in his socks, and weighed over two hundred stripped. As he leaned back a curious glitter, which Carnes had learned to associate with keen interest, showed for an instant in his eyes.

“I will be glad to hear your story, Mr. Mitchell,” he said softly. “Tell it in your own way and try not to omit any detail, no matter how trivial it may be.”

The seaman nodded and sat silent for a moment as though marshaling his thoughts.

“The story really starts the afternoon of May 12th,” he said, “although I didn’t realize the importance of the first incident at the time. We were steaming along at good speed, hoping to make New York before too late for quarantine, when a hail came from the forward lookout. I was on watch and I went forward to see what was the matter. The lookout was Louis Green, an able bodied seaman and a good one, but a confirmed drunkard. I asked him what the trouble was and he turned toward me a face that was

haggard with terror.

“‘I’ve seen a sea serpent, Mr. Mitchell,’ he said.

“‘Nonsense!’ I replied sharply. ‘You’ve been drinking again.’

“He swore that he hadn’t and I asked him to describe what he had seen. His teeth were chattering so that he could hardly speak, but he gasped out a story about seeing a monstrous head, a half mile across, he said, with a long snake body stretching out over the sea until the end of it was lost on the horizon. I turned my glass in the direction he pointed and of course there was nothing to be seen. The man’s condition was such as to make him worse than useless as a lookout, so I relieved him and ordered him below. I took it for a touch of delirium tremens.

“We were bucking a head wind, although not a very stiff one, and we didn’t make port until after dark, so we anchored at quarantine, just off Staten Island, in forty fathoms of water, and Captain Murphy radioed for a Coast Guard boat to come out and lay by us for

the night. As you have probably heard, we were carrying four millions in bar gold consigned to the Federal Reserve Bank of New York from the Bank of England.”

Dr. Bird and Carnes nodded. The inexplicable loss of the *Arethusa* had occupied much space in the papers ten days earlier.

“The cutter came out, signalled, and dropped anchor about three hundred yards away. So far, everything was exactly as it should be. I walked to the stern of the boat and looked out across the Atlantic and then I realized that Green wasn’t the only one who could see things. The wind had fallen and it was getting pretty dark, but not too dark to see things a pretty good distance away. As I looked I saw, or thought I saw, a huge black leathery mass come to the surface a mile or so away. There were two things on it that looked like eyes, and I had a feeling as though some malignant thing was staring at me. I rubbed my eyes and looked again, but the vision persisted, and I went forward to get a glass. When I came back the thing, whatever it was, had disappeared, but the water

where it had been was boiling as though there were a great spring or something of the sort under the surface.

“I trained my glass on the disturbed area, and I will take my oath that I saw a huge body like a snake emerge from the water. It lay in long undulations on the waves, and moved with them as though it were floating. It was quite a bit nearer than the first thing had been and I could see it plainly with the glass. I would judge it to be fifteen or twenty feet thick, and it actually seemed to disappear in the distance as Green had described it. The sight of the thing sent shivers up and down my spine, and I gave a hoarse shout. The lookout hurried to my side and asked me what the trouble was. I pointed and handed him the glass. He looked through it and handed it back to me with a curious expression.

“‘I can’t see nothing, sir,’ he said.

“I took the glass from him and tried to level it but my hands were trembling so that I was forced to rest it on the rail. The lookout was right. There was

absolutely nothing to be seen and the peculiar appearance of the sea had subsided to normal. The lookout was staring at me rather curiously and I knew that he was thinking the same thing about me as I had thought about Green in the afternoon. I made some kind of an excuse and went below to pull myself together. I caught a glimpse of myself in the glass. I was as white as a sheet, and the sweat was running off my face in drops.

“I shook myself together after a fashion and managed to persuade myself that the whole thing was just a trick of my mind, inspired by Green’s vivid description of his delirious vision of the afternoon. Eight bells struck, and when Mr. Fulton, the junior officer, relieved me, I laid down and tried to quiet myself. I didn’t have much luck. Just before I took the deck again at midnight I slipped down to the forecastle to see how Green was coming along. He was lying in his bunk, wide awake, with staring eyes.

“‘How are you feeling now, Green?’ I asked.

“He looked up at me with an expression of a man who

has looked death in the face.

“‘Ain’t there no chance of dockin’ to-night, Mr. Mitchell?’ he asked.

“‘Of course not,’ I said rather sharply. ‘What’s the matter with you? Are you afraid your sea serpent will get us?’

“‘He’ll get us if we stay out here to-night, sir,’ he replied with an air of conviction. ‘I saw the horrible mouth on him, large enough to bite this ship in half; and it had a beak like a bird, like a bloody parrot, sir. I saw its horrible body, too, with great black ulcers on the under side of it where the sharks had been after it. For all the shark takes a man now and then, he’s the seaman’s friend, sir, because he kills off the sea serpents who would take ship and all.’

“‘Nonsense, Green!’ I said sharply. ‘Don’t talk any more such foolishness or I’ll have you ironed. You’ve been drinking so much that you are seeing things, and I won’t have the crew disturbed by your crazy talk.’

“‘You won’t think it’s talk when those big eyes stare into yours to-night, Mr. Mitchell, and that body twists around you and squeezes the life out of you. I don’t care whether you iron me or not; I know that I’m doomed and so is everyone else; but I won’t talk about it, sir. The crew might as well rest easy while they can, for there’s no escape if we have to stay out here to-night.’

“‘Well, be sure you keep a tight mouth then,’ I said, and left rather hurriedly. I was in a cold sweat, for his air of conviction, together with what I had seen, had shaken me pretty badly. I heard the watch changing up above, and knew there would be men in the fore-castle in a minute. I didn’t want to face them right then.

“Mr. Fulton reported everything quiet when I went on deck to relieve him, and although I surveyed the water through a night glass for as far as I could see, there was nothing out of the way. The Coast Guard’s lights were shining less than a quarter of a mile away, and things looked peaceful enough. The wind had gone down with the sun; the sea was almost glassy,

and there was a bright moon.

“After going around the ship, I relieved all of the watch except two men for lookouts, and sent them below to get a good night’s sleep. If I hadn’t done that, some of them might be alive now.

“I paced the deck for an hour trying to quiet my nerves, but really getting more nervous every minute. Three bells struck and I walked forward and leaned on the rail to watch the water. I saw a peculiar swirl as though some large body were coming to the surface from below, and then I saw—it.

“Dr. Bird, I take a drink once in a while when I am on shore, but never at sea and never in excess, and I know it wasn’t a vision of drink delirium. I felt perfectly normal aside from my nervousness, and I don’t think it was fever. Either I saw it or I am insane, for it is as vivid to me as though I were standing on the *Arethusa*’s deck and that monstrous horror was rising once more before my eyes.”

The seaman’s face had become drawn and white as he

talked, and drops of sweat were trickling from his chin. Carnes sat forward absorbed in his narrative while Dr. Bird sat back with a glitter in his black eyes and an expression of great attention on his face.

“Go on, Mr. Mitchell,” the doctor said soothingly. “Tell me just what you saw.”

Mitchell shuddered and glanced quickly around the laboratory as though to assure himself that he was safe within four walls.

“From the surface of the sea,” he went on, “rose a massive body, black, and of the appearance of wet leather. It must have been a couple of hundred yards across, although the size of objects is often magnified by moonlight and my terror may have added to its size. In the midst of it were two great discs, thirty feet across, which glowed red with the reflected moonlight. It stared for a moment and then rose higher until it towered above the ship; and then I saw, or thought I saw, a huge gaping beak like a parrot’s. It was as Green had described it, large enough to bite the *Arethusa* in half, and she was a ship of three

thousand tons.

“I was frozen with horror and couldn’t move or cry out. As I watched, I saw the long snake-like body emerge from the water, and the estimate I had made of the size in the afternoon seemed pitifully inadequate. Presently a second and a third snake arose from the water, and then more, until the whole sea and the air above it seemed a writhing mass of huge snakes. I remember wondering why the watch of the Coast Guard cutter didn’t sound an alarm, and then I realized that the thing had arisen on our port side and the cutter was on the starboard.

“The mass of snakes writhed backward and forward, and then two of them rose in the air and hung over the ship. I could see the under side and I saw what Green had called the scars where the sharks had attacked. They were great cup-shaped depressions with vile white edges, and they did resemble huge sores or ulcers. They wavered over the ship for an instant, and then both of them dropped down on the deck.

“I found my voice and I think that I gave a yell, but even as I opened my mouth, I realized the futility of it. The *Arethusa* was sucked down into the sea as though it had been a tiny chip. I saw the water rising to the rail, and I think I cried out again. The ship tilted and I felt myself falling. The next thing I knew was when I was in the hospital and was told that I had been raving for a week. I was afraid to tell my story for fear I would be put in an asylum, so I kept a tight tongue in my head until I was discharged.”

Dr. Bird mused for a moment as the seaman's voice stopped.

“You cried out all right, Mr. Mitchell,” he said. “You gave two distinct shouts, both of which were heard by the watch on the *Wren*, the Coast Guard cutter. They reported that at 1:30, the *Arethusa* sank without warning. As soon as he heard your shouts, the watch gave the alarm and the crew piled on deck. The *Arethusa* was gone completely and the *Wren* was tossing about like ‘a chip in a whirlpool’ as they graphically described it. The *Wren* had steam up and they fought the waves and steamed over your

anchoring ground looking for survivors, but they found none. The sea gradually subsided and they did the only thing they could do—dropped a buoy, to guide the salvage people, and radioed for assistance. The *Robin* came out and joined them, and both cutters stood by until daylight, but nothing unusual was seen. The insurance people are trying to salvage the wreck now, but so far they have made little headway.”

“That brings me to the rest of the story, the part that made me decide to come to you, Doctor,” said the seaman. “Did you see what happened to the divers yesterday?”

Dr. Bird nodded.

“I saw a brief account of it,” he said. “It seems that two of them were lost through their lines getting fouled and their air connections severed in some way. I don’t believe the bodies have been recovered yet.”

“They never will be recovered, Doctor. I was discharged from the hospital yesterday and the

papers were just out with an account of it. I went down to the dock where the *John MacLean*, the salvage ship, ties up, and I talked to Captain Starley who commands it. I have known him casually for some years, although not intimately, and he gave me a few more details than the press got. He didn't connect me up at first with the Mitchell who was reported lost on the *Arethusa*.

"The first man to go down from the *MacLean* was Charley Melrose, an expert diver. He went down in a pressure outfit to the bottom and started to work. Everything was going along fine until the telephone suddenly rang and the man who answered it heard him say, 'Raise me, for God's sake! Hurry!' The signal for raising was given, but they hadn't got him more than thirty feet from the bottom before there came a tug on the line and he was gone! The air line, the lifting cable and the telephone cord floated free and were reeled in. Melrose had been plucked off the end of that line as you or I would pluck off a grape."

Dr. Bird leaned forward with the curious glitter again in his eye.

“Go on,” he said tersely.

“Blake, the other diver, donned a suit and insisted on being lowered at once. Starley tried to dissuade him but he insisted on going down. They lowered him over the side with a twelve-foot steel-shod pike in his hand. He never got to the bottom. He had not been lowered more than a hundred feet when a scream came over the telephone, and again there was a jerk on the lines which threatened to wreck the reel—and the line came aboard with no diver on the end of it. At the same time, Starley told me, the sea boiled and churned as though the whole bottom were coming up, and his ship was tossed about as though it were in a violent storm, although it was calm enough for forty fathom salvage work and that is pretty quiet, you know. Half the time his screws were out of water and he had a hard time to keep from being capsized. He fought his way out of the disturbed area, and as soon as he did, it started to quiet down, and in ten minutes it was calm again.

“Starley was pretty badly shaken and besides he had lost both of his divers, so he came in and I saw him at

the dock. When I heard his yarn, I took him into my confidence and told him what I had seen and that I proposed coming to you and asking your advice. I was afraid until I heard his story that it was merely a vision that I had had, but it certainly was no vision that plucked those two divers off their lines.”

“Has Captain Starley told that story to anyone else yet?”

“No, Doctor, he hasn’t. He promised not to talk until after I had seen you. I’ll vouch for him; he’ll keep his word through anything; and he is keeping his whole crew on board until he hears from me.”

Dr. Bird sprang to his feet.

“Mr. Mitchell,” he said energetically, “you have shown excellent judgment. Wire Captain Starley that you have seen me and that he is to hold his crew on board and to talk to no one until I get there. Carnes, telephone the Chief of Naval Operations and ask him

to receive me in conference at once. Have him get the Secretary of the Navy in, too, if he is available. When you have finished that, telephone Bolton that you will be away from Washington indefinitely.”

“I’ll telephone Admiral Buck for you, Doctor, but I don’t dare telephone any such message to Bolton; he’d take my head off. He has been running the whole service ragged lately, and this is my first afternoon off duty in a fortnight.”

“What’s the trouble, a flood of new counterfeits?”

“No, the counterfeit division is getting along all right. In point of fact, they have lent us a dozen men. The trouble is a sudden big increase in Communist activity throughout the country, with the Young Labor party behind it. Bolton has been pretty jumpy since that Stokowski affair last August and he is afraid of another attempt of some sort on the President.”

“The Young Labor party? I thought that gang was bankrupt and out of business, since the Coast Guard broke up their alien smuggling scheme.”

“They were down and out for a while, but they are in funds again—and how! They must have three or four millions at least.”

“Where did they get it?”

“That’s what we have been trying to find out. The leaders have presented bars of gold to a dozen banks throughout the country and demanded specie. The banks shipped the gold to the mint and it was good gold, nine hundred and twenty-five fine. What we are trying to find out is how that gold got into the United States.”

“A shipment of that size should be easy to trace.”

“It would seem so, but it hasn’t been. We have accounted for every pound of every shipment that has come in through a port of entry, and we have checked almost that close on the output of every mine in the United States. If the gold came from Russia, it would have had to cross Europe, and we can’t get any trace of it from abroad. It looks as though they were *making* it.”

Dr. Bird rubbed his head thoughtfully.

“Possible, but hardly probable,” he said. “How much did you say they had?”

“Over three millions in thirty-pound bars. Each bar shows signs of having a mint mark chiselled off, but that don’t help much for they have done too good a job. It has us pretty well bluffed.”

Again Dr. Bird rubbed his head.

“Telephone Admiral Buck, and then phone Bolton and tell him exactly what I told you to: that you will be away indefinitely. When he gets through exploding, tell him that you are going with me and that possibly, just barely possibly, we might be on the trail of that gold shipment.”

“On the trail of the gold!” gasped Carnes. “Surely, Doctor, you don’t think—”

“Once in a while, old dear,” replied the Doctor with a chuckle, “which is more than anyone in the Secret

Service does. You might tell Bolton that I said that, but hang up quickly if you do. I don't want the wires of my telephone melted off. No, Carnesy, I have no miraculous inspiration as to where that gold is coming from; I just have a plain old-fashioned hunch, and that hunch is that we are going to have lots of fun and more than our share of danger before we see Washington again. After you get through bearding Bolton in his den, you might call the Chief of the Air Corps and ask him to have a bomber held at Langley Field subject to my orders. If he squawks any, I'll talk to him."

He turned to a telephone which stood on his desk and lifted the receiver.

"Get Mr. Lambertson on the wire," he said. "He is the chief technician of the Pyrex Glass Works at Corning, New Jersey."

The *U.S.S. Minneconsin* steamed out of New York harbor and headed down toward the lower bay. On her forward deck rested a huge globe. The bottom quarter of the sphere was made of some dark opaque

substance but the upper portion was transparent as crystal. Through the walls could be seen a quantity of apparatus resting on the opaque bottom portion. Two mechanics from the Bureau of Standards were making final adjustments of one of the pieces of apparatus, which resembled a tank fitted with a piston geared to an electric motor. From the tank, tubes ran to four hollow pipes, an inch and a half in diameter, which ran through the skin and extended thirty inches from the outer skin of the twenty-foot sphere. Dr. Bird stood near talking with the executive officer of the ship and from time to time giving a brief word of direction to the mechanics.

“It’s safer than you might think, Commander,” he said. “In the first place, that globe is not made of ordinary glass; it is made of vitrilene, a new semi-malleable glass which was developed at the Bureau and which is being made on an experimental scale for us by the Pyrex people. It is much stronger than ordinary glass, and is not sensitive to shock. It is also perfectly transparent to ultra-violet light, being superior even to rock crystal or fused quartz in that

respect. The walls, as you have noticed, are four inches thick, and I have calculated that the ball will stand a uniform external pressure of thirty-five hundred atmospheres, the pressure which would be encountered at a depth of about twenty miles. I believe that it will stand a squeeze of six thousand tons without buckling, and it is impossible to fracture it by shock. It could be dropped from the top of the Woolworth Building, and it would just bounce.”

“It seems incredible that it could stand such a pressure as you have named.”

“My figures are conservative ones. Lambertson calculated them even higher, but we allowed for the fact that this is the first large mass of the material to be cast, and lowered them.”

“But suppose your lifting cable should break?” objected the naval officer. “The outfit weighs a good many tons.”

“You notice that the lower quarter is made of lead. The specific gravity of the entire globe when sealed

up tight with two men in it is only a little more than unity. In the water its weight is so little that a three-inch manilla hawser would raise it, let alone a steel cable. I have another safety device. Granted that the cable should snap, I can detach the lead from it and it would shoot to the surface like a rocket.”

“How long can you remain under water in it?”

“A week, if necessary. I have an oxygen tank and a carbon dioxide removing apparatus which will keep the air in good condition. The globe is electrically lighted, and can be heated if necessary. Should my telephone line become fouled and broken, I have a radio set which will enable me to communicate with you. I can’t see that it is especially dangerous; not nearly as much so as a submarine.”

“What is your object in going down, if I may ask?”

“To take pictures and to explore the wreck if we can. The globe is equipped with huge floodlights and excellent cameras. The salvage people are having a little trouble and we are trying to help them out.”

“You mentioned exploring. Can you leave the globe while it is under water?”

“Yes. There is a locking device for doing so. A man in a diving suit can enter the lock and fill it with water. Once the external pressure is released he can open the outer door and step out. Coming back, he seals the outer door and the man inside blows out the lock and compressed air and then the inner door can be opened. It is the same principle as a torpedo tube.”

A jangle of bells interrupted them and the *Minneconsin* slowed down. Commander Lawrence stepped to the rail and gave a sharp order to the navigating officer on the bridge. The bells jangled again and the ship’s engines stopped.

“We are almost over the buoy, Doctor,” he said.

Dr. Bird nodded and spoke to the two mechanics. With a few final touches to the apparatus they emerged from the globe and Dr. Bird entered.

“Come on, Carnes,” he called. “No backing out at the

last minute.”

Carnes stepped forward with a sickly smile and joined the Doctor in the huge sphere.

“All right, boys; close her up.”

The mechanics swung the outer door into place with a crane. Both the edge of the door and the surface against which it fitted had been ground flat and were in addition faced with soft rubber. Bolts were fastened in the door which passed through holes in the main sphere, and Dr. Bird spun nuts onto them and tightened them with a heavy wrench. He and Carnes lifted the smaller inner door into place and bolted it tight. Dr. Bird stepped to the telephone.

“Lower away,” he directed.

From a boom attached to the *Minneconsin*’s forward fighting top, a huge steel cable swung down, and the latch at the end of the cable was closed over a vitrilene ring which was fastened to the top of the sphere. The cable tightened and the globe with the

two men in it was lifted over the side of the battleship and lowered gently into the water. Carnes involuntarily ducked and threw up his hand as the waters closed over them. Dr. Bird laughed.

“Look up, Carnes,” he said.

Carnes gasped as he looked up and saw the surface of the water above him. Dr. Bird laughed again and turned to the telephone.

“Lower away,” he said. “Everything is tight.”

The globe descended into the depths of the sea. Darker and darker it grew until only a faint twilight glow filled the sphere. A dark bulk loomed before them. Dr. Bird snapped on one of his huge floodlights and pointed.

“The *Arethusa*,” he said.

The ill-fated vessel lay on her side with a huge jagged hole torn in her fabric amidships.

“That’s where her boilers burst,” explained the Doctor. “Luckily we have a hard bottom to deal with. Let’s see if we can locate any of Mitchell’s sea serpents.”

He turned on other flood lights and swept the bottom of the sea with them. The huge beams bored out into the water for a quarter of a mile, but nothing unusual was to be seen. Dr. Bird turned his attention again to the wreck.

“Things look normal from this side,” he said after a prolonged scrutiny. “I’ll have the *Minneconsin* steam around it while we look it over.”

In response to his telephone orders the ship above them swung around the wreck in a circle, and Carnes and the Doctor viewed each side in turn. But nothing of a suspicious nature made its appearance. The sphere stopped opposite the hole in the side and Dr. Bird turned to Carnes.

“I’m going to put on a diving suit and explore that wreck,” he said. “If there ever was any danger, it isn’t

apparent now; and I can't find out anything until I get inside."

"Don't do it, Doctor!" cried Carnes. "Remember what happened to the other divers!"

"We don't know what happened to them, Carnes. No matter what it was, there is no danger apparent right now, and I've got to get into that ship before I can get any real information. We could have lowered an under-sea camera and learned as much as we have so far."

"Let me go instead of you, Doctor."

"I'm sorry to refuse you, old dear, but frankly, I wouldn't trust your judgment as to what you had seen if you went alone; and we can't both go."

"Why not?"

"If we both went, who would work the air to let us

back in? No, this is a one-man job and I'm the one to do it. While I am gone, keep a sharp lookout, and if you see anything unusual call me at once."

"How can I call you?"

"On this small radio phone. A pair of receivers tuned to the right wave-length are in my diving helmet, and I will be able to hear you although I can't reply. I won't be gone long: I have only a small air tank, large enough to keep me going for thirty minutes. Now help me into my suit and keep a sharp watch. A timely warning may save my life if anything happens."

With Carnes' assistance, Dr. Bird donned a deep-sea diving outfit and screwed down the helmet. He crawled through the inner door into the lock and lifted the inner door into place. Carnes fastened the door with nuts and the Doctor opened a pair of valves in the outer door and filled the lock with water. He removed the outer door; and, taking in one hand a steel-shod twelve-foot pike with a hook on the end, and in the other a waterproof flashlight, he sallied forth. As he left the shell he paused for a moment,

and then returned and picked up the heavy wrench with which he had removed the nuts holding the outer door into place. He fastened the tool to the belt of his suit. Then, with a wave of his hand toward the detective, he approached the hulk.

The hole in the side was too high for him to reach, but he hooked the end of his pike in one of the joints of the *Arethusa's* plates and climbed slowly and painfully up the side of the vessel. As he disappeared into the hull, Carnes realized with a sudden start that he had been watching his friend and neglecting the duty imposed on him of keeping a sharp watch. He turned quickly to the floodlights and searched the sea bottom.

Nothing appeared, and the minutes moved as slowly as hours should. Carnes felt that he had been submerged alone for weeks, and his nerves grew so tense that he felt that he would scream in another instant. A sudden thought sobered him like a dash of cold water. If he screamed, Dr. Bird would take it for an alarm signal and possibly be afraid to emerge from the vessel. His watch showed him that the Doctor had

been gone for twenty-five minutes and he moved slowly to the radio transmitter.

“Dr. Bird,” he said slowly and distinctly, “you have been gone nearly thirty minutes. Nothing alarming has appeared but I will feel better when I see you coming back.”

He glued his eyes on the opening in the ship’s side and waited. Five minutes passed, and then ten, with no signs of the Doctor. Carnes moved again to the receiver.

“It has been over half an hour. Doctor,” he cried in a pleading voice. “If you are all right, for God’s sake show yourself. I am frantic with worry.”

Another five minutes passed, and the sweat dripped in a steady stream from the detective’s chin. Suddenly he gave a sob of relief and sank back against the side of the globe. A bulky figure showed at the edge of the hole, and Dr. Bird climbed slowly and heavily out of the hold and dropped to the sea bottom. He lay prone for a moment before he rose and made his way with

evident effort toward the sphere. He entered the compartment and with a heroic effort lifted the outer door into place, and feebly and with fumbling fingers placed nuts on the bolts. His hands wandered uncertainly toward the valves and closed the upper one. He waved his hand toward Carnes and sank in a heap on the floor of the lock.

With trembling hands Carnes connected the air and opened the valve. Air flowed into the lock and the water was gradually forced out. When the lock was empty, he waited for Dr. Bird to close the outer valve but the Doctor did not move. Carnes tore at the bolts which held the inner door and threw his weight against it. It held against his assault, and he thought frantically. An inspiration came to him, and he disconnected the air valve. With a whistling rush, the air from the lock rushed into the sphere and he forced open the inner door. A stream of sea water drove against his feet through the open valve, and he reached for the valve to close it. The force of the water held it open for a moment, but he threw every ounce of his strength into the effort. The valve slowly

closed.

It was beyond his strength to haul the heavy Doctor with his pressure diving suit through the restricted confines of the inner door, so Carnes wormed his way into the lock and with trembling fingers unscrewed the helmet of the Doctor's diving suit. The helmet clanged to the floor and Carnes scooped up his hands full of water and dashed it into the Doctor's face. There was no response and he was at his wit's end. He sprang for the radio to order the sphere hauled up when his glance fell on the oxygen tank. It took him only a moment to connect a rubber hose to the tank, and in a few seconds a blast of the life-giving gas was blowing into the scientist's face. Dr. Bird gave a convulsive gasp or two and opened his eyes.

"Shut off the juice, Carnes," he said faintly. "Too much of that's bad."

Carnes shut off the oxygen and Dr. Bird struggled to a sitting position and inhaled deep breaths.

"That was a narrow squeak, old dear," he said faintly.

“Give me a hand and I’ll climb in.”

With the detective’s aid he climbed into the sphere and Carnes fastened the inner door. Slowly the Doctor rid himself of the diving suit and lay prone on the floor, his breath still coming in gasps.

“Thanks for your warning about the time, Carnes,” he said. “I knew that my air supply was running short but I was caught down there and couldn’t readily free myself. I thought for a while that my time had come, but it wasn’t so written. By the looks of things, I freed myself just in time.”

“Did you find out anything?” asked the detective eagerly.

“I did,” replied Dr. Bird grimly. “For one thing, the gold is no longer in the hold of the *Arethusa*.”

“It’s gone?”

“Clean as a whistle, every bar of it. A hole has been cut in the vault around the combination, and the bars

slid back and the door opened. The gold has been stolen.”

“Might it not have been stolen before the vessel sank?”

“The idea occurred to me of course, and I examined things pretty carefully. I know that the theft occurred after the vessel sank.”

“How could you tell?”

“For one thing, the hole was cut with an under-water cutting torch. For the second, look here.”

The Doctor rolled up his trousers and showed the detective his leg. Carnes cried out as he saw huge purple welts on it.

“What caused that?” he cried.

“As I entered the vault, I stepped full into a steel bear trap which was set there for the purpose of catching and holding anyone who entered. Someone has visited

the *Arethusa*, since she sank, and looted her, and also arranged so that any diver who got as far as the vault would never return to the surface to tell of it. Luckily for myself, I carried a heavy wrench and was able to free myself. Most divers don't carry such a thing."

"But who could have done it?"

"That's what we have got to find out, and we aren't going to do it down here. Give the word to have us hauled up; and, Carnes, don't mention anything about the looting of the vessel. Allow it to be understood that I couldn't get into the hold. We'll head back for New York at once. I want to have a few small changes made in this sphere before we use it again. While I am doing that, I want you to get hold of the Coast Guard or the Immigration Service or whoever it is that has the complete records in that case of alien smuggling, by the Young Labor party. When you get the information, report to me and we'll go over it. You might also drop a hint to Captain Starley that will stop all further attempts at salvage operations for a few days. Tell him that I'll arrange to have a Coast Guard cutter guard the locality of the wreck."

“Won’t that be rather risky for the cutter?”

“I think not. The gold is gone and there is no reason to apprehend any further danger in that locality, at least for the present.”

At nine o’clock next morning Carnes and Dr. Bird sat in the office of Lieutenant Commander Minden of the United States Coast Guard, listening intently to the history of the alien smuggling case. Commander Minden was saying:

“Their boats would load up and clear ostensibly for Rio de Janeiro or some other South American port, but once they were in the Atlantic, they would alter their course and head from the Massachusetts coast. Of course, we had no right to interfere with them on the high seas, and they never came closer than fifty miles of our coast line. When they got that close, they would cruise slowly back and forth for a few days and then steam away south to the port they had cleared for. When they got there, of course there were no passengers on board.

“We patrolled the coast carefully while they were around but we never got any indication of any landing of aliens and yet we knew they were being landed in some way. We drew lines so close that a cork couldn’t get by without being seen and we even had the air patrolled, but with no results. Eventually the air patrol was the thing that gave them away.

“They had been operating so successfully that they evidently got careless and started a load off late in the night so they didn’t reach the coast by dawn. A Navy plane was flying along the coast-line about twelve miles off when they spotted a submarine running parallel with the coast, headed north. It didn’t look like an American craft and they went on and radioed Washington and found that we had no under-sea craft in that neighborhood. They returned to their patrol and followed the sub for a matter of thirty or forty miles up the coast, and then it turned in right toward the shore. The shore line there is rocky, and, at the point where the sub was heading, it falls sheer about two hundred fathoms. The sub ran right at the cliff and disappeared from view.”

Lieutenant Commander Minden paused impressively. Carnes and Dr. Bird set forward in their chairs, for it was evident that the crux of the story was at hand.

“When the plane reported what they had seen, we knew how those aliens were being landed. The point where the sub went in gave us a good idea of the location of their base and we threw a cordon of men around and searched. A Navy sub was sent to the scene and they reported that there was a tunnel opening into the rock, about a hundred fathoms under water, running for they had no idea how far under the land. They stayed to guard the hole while we combed the land. It took us a week to locate the place, but we traced some truck loads of food and finally found it. This tunnel ran under the land for a mile and then ended in a large cave underground. The Young Labor party had established a regular receiving depot there, and took the aliens from the sub and kept them for a day or two until they had a chance to load them into trucks and run them into Boston or some other town in the night.

“Once we had the place spotted, we sent a gang in

and captured the whole works without any trouble. The underground cavern had no natural opening to the surface, but one had been made by blasting. We captured the whole lot and then sealed the end of the hole with rock and concrete. That was the end of the affair.”

“Thank you, Commander; you have given us a very graphic description of it. I suppose you could find the entrance which was sealed up?”

“Easily. I led the raiding party. I forgot to mention one blunder we made. Evidently some word of our plans leaked out, for the sub which was guarding the outer end of the tunnel was called away by a radio message supposed to be from the Navy Department. It had gone only a short distance, however, when the commander smelled a rat and made his way back. He was too late. He was just in time to see the sub emerge from the hole and head into the open sea. He gave chase, but the other sub was faster than the Navy boat and it got clear away. The leader of the gang must have been on it, for we didn’t get him.”

“Who was the leader?”

“From some records we captured, his name was Ivan Saranoff. I never saw him.”

“Saranoff?” said Dr. Bird thoughtfully. “The name seems familiar. Where have I—Thunder! I know now. He was at one time a member of the faculty of St. Petersburg. He was one of the leading biologists of his time. Carnes, we’ve found our man.”

“If you are thinking of Saranoff, I am afraid you are mistaken, Doctor,” said Commander Minden. “Neither he nor his submarine have ever been heard of since and it has been generally conceded that they were lost at sea. We had some pretty rough weather just after that affair.”

“Rough weather doesn’t mean much to a sub, Commander. I expect that he’s our man. At any rate, the place we want to go is the end of that tunnel.”

“I’m at your service, Doctor.”

“Carnes, get the location of that tunnel entrance from Commander Minden and order the *Minneconsin* to proceed north along the coast to that vicinity and stand by for radio orders. I am going to telephone Mitchell Field and get a plane. We have no time to lose.”

The plane from Mitchell Field roared down to a landing, and Carnes, Dr. Bird and Commander Minden dismounted from the rear cockpit and looked around. They had landed in a smooth field at the base of a rise almost rugged enough to be called a mountain. A group of three men were standing near them as they got out of the plane. One of the men approached.

“Dr. Bird?” asked the newcomer. “I am Tom Harron, United States Marshal. These two men are deputies. I understand that I am to report to you for orders.”

“I’m glad to know you, Mr. Harron. This is Operative Carnes of the Secret Service and Commander Minden of the Coast Guard. We are going to explore an underground cavern that is located in this vicinity.”

“Do you mean the one where they used to smuggle aliens? That is closed up. I was in charge of that work and we closed it tight as a drum two years ago.”

“Can you find the entrance?”

“Sure. It isn’t over a mile from here.”

“Lead the way, then. We want to take a look at it.”

The marshal led the way toward the eminence and took a path which led up a gully in its side. He paused for a moment to take his bearings and then turned sharply to his left and climbed part way up the side of the ravine.

“Here it is,” he announced. An expression of astonishment crossed his face and he examined the ground closely. “By Golly, Doc,” he went on as he straightened up, “this place has been opened since I left it!”

Dr. Bird hurried forward and joined him. The heavy stone and concrete with which the entrance to the

cavern had been sealed were undisturbed, but in the side of the hill was set a steel door beside the concrete. There was no sign of a keyhole or other means of entering it.

“Was this steel door part of your work?” asked Carnes.

“No, sir, it wasn’t. We sealed it solid. That door has been put there since.”

Dr. Bird closely examined the structure. He tapped it and went around the edges and then straightened up and took a small pocket compass from his pocket and opened the case. The needle swung crazily for a moment and then pointed straight toward the door.

“A magnetic lock,” he exclaimed. “If we could find the power line it would be easy to force, but finding that line might take us a week. At any rate, we have found out what we were after. This is their base from which they are operating. Mr. Harron, I want you to station a guard armed with rifles at this door day and night until I personally relieve you. Remember, until I

relieve you, in person. Verbal or written orders don't go. Capture or kill anyone who tries to enter or leave the cavern through this entrance. Just now we'll find that cavern more vulnerable from the sea end, and that is where I mean to attack. We'll force that door and explore from this end later. Commander Minden, you may stay here with Mr. Harron, if you like, or you may come with Carnes and me. We are going on board the *Minneconsin*."

The Mitchell Field plane roared to a take-off and bore south along the coast. Half an hour of flying brought them in view of the battleship steaming at full speed up the coast. Dr. Bird radioed instructions to the ship, and an hour later a launch picked them up from the beach and took them out. As soon as they were on board they resumed their progress, and in two hours the peak that Dr. Bird had marked as a landmark was opposite.

"Steam in as close to the shore as you can safely," he said, "and then lower us. Once we are down, you will be guided by our telephoned instructions. Come on, Carnes, let's go."

The detective followed him into the sphere as the *Minneconsin* edged up toward the shore. The huge ball was lifted from the deck and lowered gently into two hundred fathoms of water. It was pitch dark at that depth, and Dr. Bird switched on one floodlight and studied the cliff which rose a hundred yards from them.

“We have missed the place, Carnes,” he said. “We’ll have them pull us up a few hundred feet and then steam along the coast.”

He turned to the telephone and the sphere rose while the battleship steamed slowly ahead, the vitrilene ball following in her wake. For a quarter of a mile they continued on their way, and then Dr. Bird halted the ship.

“What depth are we?” he asked. “Eighty fathoms? All right, lower us, please.”

The ball sank until it rested on the sea bottom, and Dr. Bird turned on two additional floodlights and studied the surroundings. The bed of the ocean was

literally covered with lobster and crab shell, with the bones of fish scattered here and there among them. A few bones of land animals were mixed with the debris and Carnes gave a gasp as Dr. Bird pointed out to him a diving helmet.

“We are on the right track,” said the scientist grimly. He stepped to the telephone and ordered the sphere raised to one hundred fathoms. The ship moved forward along the coast until Dr. Bird again stepped to the telephone and halted it. Before them yawned the entrance to the underground tunnel. It was about two hundred feet high and three hundred across, and their most powerful beams would not penetrate to the end of it. A pile of debris could be seen on the floor of the tunnel and Carnes fancied that he could see another diving helmet among the litter. Dr. Bird pointed toward the side of the cavern.

“See those floodlights fastened to the cliff so that their beams will sweep across the mouth of the tunnel when they are lighted?” he said. “Apparently the cave is used as a prison and the light beams are the bars. The creature is not at home just now or the bars

would be up. My God! Look at that, Carnes!”

Carnes stared and echoed the Doctor’s cry of surprise. Clinging to a shelf of rock which extended out from the wall of the cavern and half hidden among the seaweed was a huge marine creature. It looked like a huge black slug with rudimentary eyes and mouth. The thing was fifty feet in length and fully fifteen feet in diameter. It hung there, moving sluggishly as though breathing, and rudimentary tentacles projecting from one end moved in the water.

“What is it, Doctor?” asked Carnes in a voice of awe.

“It is a typical trochosphere of the giant octopus, the devil fish of Indian Ocean legend, multiplied a thousand times,” he replied. “When the octopus lays its eggs, they hatch out into the larval form. The free swimming larva is known as a trochosphere, and I am positive that that is what we see; but look at the size of the thing! Man alive, if that ever developed, I can’t conceive of its dimensions!”

“I have seen pictures of a huge octopus pulling down

a ship,” said Carnes, “but I always fancied they were imaginary.”

“They are. This monstrosity before us is no product of nature. A dozen of them would depopulate the seas in a year. It is a hideous parody of nature conceived in the brain of a madman and produced by some glandular disturbance. Saranoff spent years in glandular experimentation, and no doubt he has managed to stimulate the thyroid of a normal octopus and produce a giant. I fancy that the immediate parent of the thing before us was of normal size, and so, probably, are its brothers and sisters. The phenomenon of giantism of this nature occurs in alternate generations and then only in rare instances. Its grandparent may not be far away, however. I wish it was safe to use a submarine to explore that cavern.”

“Why isn’t it?”

“Any creature powerful enough to pull the *Arethusa* under water would crush a frail submarine without effort. Anyway, a Navy sub isn’t built for under-water

exploration like this ball is. The window space is quite limited and they aren't equipped with powerful floodlights. I would like to be able to reach that thing and destroy it, but it can wait until later. The best thing we can do is to put out our lights and wait."

His hand sought the light switch, and the globe became dark. Only a tiny glimmer of light came down to them from the surface, a hundred fathoms above. In the darkness they stared into the depths of the sea.

For an hour they waited and then Dr. Bird grasped Carnes by the shoulder and pointed. Far in the distance could be seen a tiny point of light. It wavered and winked and at times disappeared, but it was gradually approaching them. Dr. Bird stepped to the telephone and the *Minneconsin* moved a hundred yards further from the shore. The light disappeared again as though hidden by some opaque body. Their eyes had become accustomed to the dim light and they could dimly see a long snake-like body approach the globe and then suddenly withdraw.

The light appeared again only a few hundred yards

away. The water swirled and the sphere swayed drunkenly as some gigantic body moved past it with express train speed and entered the mouth of the cavern. The light turned toward them and they could see the dim outlines of a small submarine on which it was mounted. Another rush of water came as the object which had entered the cave started to leave it, and the light swung around. It bore on a huge black body, and was reflected with a red glow from huge eyes, and the creature backed again into the cave. Back and forth across the mouth of the cavern the light played, and the watchers caught a glimpse of a huge parrot beak which could have engulfed a freight car. From the cavern projected twisting tentacles of gargantuan dimensions, and red eyes, thirty feet in diameter, glared balefully at them. For several minutes the light of the submarine played across the mouth of the cave, and then the floodlights on the cliff sprang into full glow and bathed the ball and the mouth of the tunnel in a flood of light.

Before their horrified gaze was an octopus of a size to make them disbelieve their eyes. The submarine had

moved up to within a few feet of them, and the light from it played full on the ball. The submarine maneuvered in the vicinity, keeping the ball full in the beam of its light, and then drew back. As it did so, the floodlights on the cliff died out and the beam of the submarine's light was directed away from them. Dr. Bird jumped to the telephone.

"Head straight out to sea and full speed ahead!" he shouted. "Don't try to pull us in; tow us!"

The ball swayed as the *Minneconsin's* mighty engines responded to his orders and the cliff wall disappeared.

"As long as they know we're here, we might as well announce our presence in good style," said the doctor grimly as he closed a switch and threw all of the sphere's huge lights into action. He had turned on the lights just in time, for even as he did so a mighty tentacle shot out of the darkness and wrapped itself around the ball. For a moment it clung there and then was withdrawn.

“The thing can’t stand light,” remarked the doctor as he threw off the switch. “That sub was herding it like a cow by the use of a light beam. As long as we are lighted up we are safe from attack.”

“Then for God’s sake turn on the lights!” cried Carnes.

“I want it to attack us,” replied the doctor calmly. “We have no offensive weapons and only by meeting an attack can we harm the thing.”

As he spoke there came a soft whisper of sound from the vitrilene walls and they were thrown from their feet by a sudden jerk. Dr. Bird stumbled to the switch and closed it, and the ball was flooded with light. Two arms were now on them but they were slowly withdrawn as the lights glared forth. The huge outlines of the beast could be seen as it followed them toward the surface. Its great eyes glared at them hungrily. The submarine was visible only as a speck of light in the distance.

The *Minneconsin*’s speed was picking up under the

urge of her huge steam turbines, and the ball was nearing the surface. The sea was light enough now that they could see for quite a distance. The telephone bell jangled and Dr. Bird picked the receiver from its hook.

“Hello,” he said. “What’s that? You can? By all means, fire. Yes, indeed, we’re well out of danger; we must be thirty or forty feet down. Watch the fun now,” he went on to Carnes as he replaced the receiver. “The beast is showing above the surface and they’re going to shell it.”

They watched the surface and suddenly there came a flash of light followed by a dull boom of sound. The huge octopus suddenly sank below them, thrashing its arms about wildly.

“A hit!” shouted Dr. Bird into the telephone. “Get it again if it shows up. I want it to get good and mad.”

He turned off the lights in the ball and the octopus attacked again. The shell had taught it caution and it kept well down, but three huge arms came up from

the depths of the sea and wrapped themselves about the ball. The forward motion stopped for a moment, and then came a jerk that threw them down. The ball started to sink.

“Our cable has parted!” cried the doctor. “Turn on the lights!”

Carnes closed the switch. The ball was so covered with the huge tentacles that they could see nothing, but the light had its usual effect and they were released. The ball sank toward the bottom and they could see the huge cephalopod lying below watching them. Blood was flowing from a wound near one of its eyes where the *Minneconsin's* shell had found its mark.

Toward the huge monster they sank until they lay on the bottom of the ocean and a few yards from it. In an instant the sea became opaque and they could see nothing.

“He has shot his ink!” cried the doctor. “Here comes the real attack. Strap yourself to the wall where you

can reach one of the motor switches.”

Through the darkness huge arms came out and wrapped themselves around the ball. The heavy vitrilene groaned under the enormous pressure which was applied, but it held. The ink was clearing slightly and they could see that the sphere was covered by the arms. The mass moved and the huge maw opened before them. The pipes projecting from the sides of the ball were buried in the creature’s flesh.

“Good Lord, he’s going to swallow us!” gasped the doctor. “Quick, Carnes, the motor switch.”

He closed one of them as he spoke, and the powerful little electric motors began to hum, forcing forward the piston attached to the tank connected to the hollow rods. Steadily the little motors hummed, and the tank emptied through the rods into the body of the giant cephalopod.

“I hope the stuff works fast,” groaned the doctor as they approached closer to the giant maw. “I never tried giving an octopus a hypodermic injection of

prussic acid before, but it ought to do the business. There's enough acid there to kill half New York City."

Carnes blanched as the ball approached the mouth. One by one the arms unwound until only one was holding them and the jaws opened wider. They were almost in them when the motion stopped. They could feel a shudder run through the arm which held them. For a moment the arm alternately expanded and contracted, almost releasing them only to clutch them again. Another arm came from the depths and whipped about the ball, and again the vitrilene groaned at the pressure which was applied. The arms were suddenly withdrawn and the ball started to sink.

"Drop the lead, Carnes!" cried the doctor. With the aid of the detective he operated the electric catches which held the huge mass of lead to the bottom, and the sphere shot up through the water like a rocket. It leaped clear of the water and fell back with a splash. A half mile away the *Minneconsin* was swinging in a wide circle to head back toward them. They turned their gaze toward the shore.

As they looked a giant arm shot a hundred yards up into the air, twisting and writhing frantically. It disappeared, and another, and then half a dozen flashed into the air. The arms dipped below the surface. A huge black body reared its bulk free from the water for a moment, and the sea boiled as though in a violent storm. The body sank and again the arms were thrown up, twisting and turning like a half dozen huge snakes. The whole creature sank below the waves and the ball tossed back and forth, often buried under tons of water and once tossed thirty feet into the air by the huge waves.

A momentary lull came in the waves. Carnes gave a cry of astonishment and pointed toward the shore. With an effort, Dr. Bird twisted himself in his lashing and looked in that direction. The huge body had again come to the surface, and three of the arms were towering into the air. Grasped in them was a long, black, cigar-shaped object. As they watched the object was torn into two parts and the fragments crushed by the enormous power of the octopus. Again the arms writhed in torment, and then they stiffened

out. For a moment they towered in the air and then slowly sank below the surface of the sea.

“The cyanide has worked,” cried the doctor, “and in its last agonies the creature has turned on its creator and destroyed him. It is a shame, for Saranoff was a brilliant although perverted genius, and besides, I would have liked to have learned his method.

However, I may find something when we open the land end and raid the cave; and really, he was too brilliant a man to hang for murder. Once we open the cave and I get any data that is there, my connection with the case will end. Trailing down the gold and recovering it is a routine matter for Bolton, and one in which he won’t need my help.”

“What about that creature we saw in the cave, Doctor? Won’t it hatch into another terror of the sea like the thing that destroyed the ship?”

“The trochosphere? No, I’m not worried there. It won’t try to leave the cave for some days yet, and by that time we’ll have the land end opened and the floodlights turned on. They will keep it there and it

will starve to death. We could send down a sub to feed it a torpedo, but there's no need. Nature will dispose of it. Meanwhile, I hope the *Minneconsin* rigs up a jury tackle pretty soon and takes us on board. I'm getting seasick."

#62 Gray Denim, By Harold Vincent Schoepflin:

The blood of the Van Dorn's ran in Karl's veins. He rode the skies like an avenging god.

Aproximate word count: 9,700

Warnings:

there came a stabbing pencil

- - -

Beneath the huge central arch in Cooper Square a meeting was in progress—a gathering of the gray-clad workers of the lower levels of New York. Less than two hundred of their number were in evidence, and these huddled in dejected groups around the pedestal from which a fiery-tongued orator was addressing them. Lounging negligently at the edge of the small crowd were a dozen of the red police.

“I tell you, comrades,” the speaker was shouting, “the time has come when we must revolt. We must battle to the death with the wearers of the purple. Why work out our lives down here so they can live in the lap of luxury over our heads? Why labor day after day at the oxygen generators to give them the fresh air they breathe?”

The speaker paused uncertainly as a chorus of raucous laughter came to his ears. He glared belligerently at a group of newcomers who stood aloof from his own gathering. Seven or eight of them there were, and they wore the gray with obvious

discomfort. Slummers! Well, they'd hear something they could carry back with them when they returned to their homes!

"Why," he continued in rising tones, "do we sit at the controls of the pneumatic tubes which carry thousands of our fellows to tasks equally irksome, while they of the purple ride their air yachts to the pleasure cities of the sky lanes? Never in the history of mankind have the poor been poorer and the rich richer!"

"Yah!" shouted a disrespectful voice from among the newcomers. "You're full o' bunk! Nothing but bunk!"

An ominous murmur swelled from the crowd and the red police roused from their lethargy. The mounting scream of a siren echoed in the vaulted recesses above and re-echoed from the surrounding columns—the call for reserves.

All was confusion in the Square. The little group of newcomers immediately became the center of a mêlée of dangerous proportions. Some of the more timid of

the wearers of the gray struggled to get out of the crowd and away. Others, not in sympathy with the speaker, rushed to the support of the besieged visitors. The police were, for the moment, overwhelmed.

The orator, mad with resentment and injured pride, hurled himself into the group. A knife flashed in his hand; rose and fell. A scream of agony shrilled piercingly above the din of the fighting.

Then came the reserves, and the wielder of the knife turned to escape. He broke away from the milling combatants and made speedily for the shadows that lay beyond the great pillars of the Square. But he never reached them, for one of the red guards raised his riot pistol and fired. There was a dull *plop*, and a rubbery something struck the fleeing man and wrapped powerful tentacles around his body, binding him hand and foot in their swift embrace. He fell crashing to the pavement.

A lieutenant of the red police was shouting his orders and the din in the Square was deafening. With their

numbers greatly augmented, the guards were now in control of the situation and their maces struck left and right. Groans and curses came from the gray-clad workers, who now fought desperately to escape.

Then, with startling suddenness, the artificial sunlight of the cavernous Square was gone, leaving the battle to continue in utter darkness.

Cooper Square, in the year 2108, was the one gathering place in New York City where the wearers of the gray denim were permitted to assemble and discuss their grievances publicly. Deep in the maze of lower-level ways seldom visited by wearers of the purple, the grottolike enclosure bore the name of a philanthropist of the late nineteenth century and still carried a musty air of certain of the traditions of that period.

In Astor Way, on the lowest level of all, there was a tiny book shop. Nestled between two of the great columns that provided foundation support for the eighty levels above, it was safely hidden from the gaze of curious passersby in the Square. Slumming

parties from afar, their purple temporarily discarded for the gray, occasionally passed within a stone's throw of the little shop, never suspecting the existence of such a retreat amidst the dark shadows of the pillars. But to the initiated few amongst the wearers of the gray, and to certain of the red police, it was well known.

Rudolph Krassin, proprietor of the establishment, was a bent and withered ancient. His jacket of gray denim hung loosely from his spare frame and his hollow cough bespoke a deep-seated ailment. Looking out from behind thick lenses set in his square-rimmed spectacles, the watery eyes seemed vacant; uncomprehending. But old Rudolph was a scholar—keen-witted—and a gentleman besides. To his many friends of the gray-clad multitude he was an anomaly; they could not understand his devotion to his well-thumbed volumes. But they listened to his words of wisdom and, more frequently than they could afford, parted with precious labor tickets in exchange for reading matter that was usually of the lighter variety.

When the fighting started in the Square, Rudolph was

watching and listening from a point of vantage in the shadows near his shop. This fellow Leontardo, who was the speaker, was an agitator of the worst sort. His arguments always were calculated to arouse the passions of his hearers; to inflame them against the wearers of the purple. He had nothing constructive to offer. Always he spoke of destruction; war; bloodshed. Rudolph marveled at the patience of the red police. To-day, these newcomers, obviously a slumming party of youngsters bent on whatever mischief they could find, were interfering with the speaker. The old man chuckled at the first interruption. But at signs of real trouble he scurried into the shadows and vanished in the blackness of first-level passages known only to himself. He knew where to find the automatic substation of the Power Syndicate.

Returning to the darkness he had created in the Square, he was relieved to find that the sounds of the fighting had subsided. Apparently most of the wearers of the gray had escaped. He skirted the avenue of pillars along Astor Way, feeling his way from one to another as he progressed toward his little shop.

Peering into the blackness of the square he saw the feeble beams of several flash-lamps in the hands of the police. They were searching for survivors of the fracas, maces and riot pistols held ready for use. A sobbing gasp from close by set his pulses throbbing. He crept stealthily in the direction from which the sound had come.

“Steady now,” came a whispered voice. “My uncle’s shop is close by. He’ll take you in. Here—let me lift you.”

There was a shuffling on the opposite side of the pillar at which Rudolph had halted; another grunt of pain.

“Karl!” hissed the old man. It was his nephew.

“Uncle Rudolph?” came the guarded response.

“Yes. Can I help you?”

“Quick—yes—he’s fainted.”

The old man was around the huge base of the column

in an instant. He groped in the darkness and his hands encountered human bodies.

“Who is it?” he breathed.

“One of the hecklers, Uncle. A young lad; and of the purple I think. He’s been knifed.”

Together they dragged the inert form into the shelter of the long line of pillars. There was a trampling of many men in the square. That would be a second detachment of reserves. A ray of light filtered through and dancing shadows of the giant columns made grotesque outlines against the walls of the Way. A portable searchlight had been brought to the scene. They must hurry.

Impeded by the dead weight of their burden, they made sorry progress and several times found it necessary to halt in the shadow of a pillar while the red police passed by in their search of the Square. It was with a sigh of relief that Rudolph opened the door of his shop and with still greater satisfaction closed and bolted it securely. His nephew shouldered the

limp form of the unconscious youth and carried it to his own bed in one of the rear rooms.

“Ugh!” exclaimed old Rudolph as he ripped open the young man’s shirt, “it’s a nasty cut. Warm water, Karl.”

The gaping wound was washed and bound tightly. Rudolph’s experienced fingers told him the knife had not reached a vital spot. The youth would recover.

“But Karl,” he objected, “he wears the purple. Under the gray. See! It’ll get us in trouble if we keep him.”

He was stripping the young man of his clothing to prepare him for bed. Suddenly there was revealed on the white skin a triangular mark. Bright scarlet it was and just over the right hip. He made a hasty attempt to hide it from the watching eyes of Karl.

“Uncle!” snapped his nephew, “—the mark you call cursed! He has it, too!”

The tall young man in gray was on his knees, tearing

the hands of the old man away. He saw the mark clearly now. There was no further use of attempting to conceal it. Rudolph rose and faced his angered nephew, his watery eyes inscrutable.

“You told me, Rudolph, that it was a brand that cursed me. I have seen it on him, too. You have lied to me.”

The old man’s eyes wavered. He trembled violently.

“Why did you lie?” demanded Karl. “Am I not your nephew? Am I not really cursed as you’ve maintained? Tell me—tell me!”

He had the old man by the shoulders, shaking him cruelly.

“Karl—Karl,” begged the helpless ancient, “it was for your good. I swear it. You were born to the purple. That’s what that mark means—not that you’re degraded to the gray, as I said. But there’s a reason. Let me explain.”

“Bah! A reason! You’ve kept me in this misery and squalor for a reason! Who’s my father?”

He flung Rudolph to the floor, where the old man crouched in apprehensive misery.

“Please Karl—don’t! I can explain. Just give me time. It’s a long story.”

“Time! Time! For twenty-odd years you’ve lied to me; cheated me. My birthright—where is it?”

He menaced his supposed uncle; was about to strike him. Then suddenly he was ashamed. He turned on his heel.

“I’m leaving,” he said shortly.

“Karl—my boy,” begged Rudolph Krassin, struggling to his feet. “You can’t! That lad in there—he—”

But Karl was too angry to reason.

“To hell with him!” he raged, “and to hell with you!”

I'm through!"

He stamped from the room and out into the eery shadows of the Way. Karl was done with his old life. He'd go to the upper levels and claim his rights. Some day, too, he'd punish the man who'd stolen them away. God! Born to the purple! To think he'd missed it all! Probably was kidnaped by the old rascal he'd been calling uncle. But he'd find out. Rudolph didn't have to explain. Fingerprint records would clear his name; establish his rightful station in life. He dived into a passage that would lead him to one of the express lifts. He'd soon be overhead.

A sergeant of the red police looked up startled from his desk as a tall youth in the gray denim of forty levels below appeared before him.

"Well?" he growled. The stalwart young worker had stared belligerently and insolently, he thought.

"I want to check my fingerprint record, Sergeant."

"Hm. Pretty cocky, aren't you? The records for such

as you are down below, where you belong.”

“Not mine, I think.”

“So? And who the devil are you?”

“That’s what I’m here to find out. I’ve got a triangle branded on my right hip.”

“A what?”

“Triangle. Here—look!”

The amazing youngster had raised his jacket and was pulling at his shirt. The sergeant stared at what was revealed, his eyes bulging as he looked.

“Lord!” he gasped, “a Van Dorn—in the gray!”

Quickly he turned to the radiovision and made rapid connection with several persons in turn—important ones, by the appearance of the features of each in the brilliant disc of the instrument.

Karl was confused by the sudden turn of things. The

sergeant talked so rapidly he could not catch the sense of his words. And that name, Van Dorn, eluded him. He knew he had heard it before, in the little shop down there in Astor Way. But he could not place it. He wished fervently that he had paid more attention to the desires of old Rudolph; had studied more and read the books the old man had begged him to read. His new surroundings confused him, too, and he knew that he was the center of some great new excitement.

Then they were in the room; two individuals, one in the red uniform of a captain of police, the other a pompous, whiskered man in purple. Others followed and it seemed to Karl that the room was filled with them, strangers all, and they stared at him and chattered incessantly. He experienced an overwhelming impulse to run, but mastered it and faced them boldly.

A square of plate glass was placed under his outstretched fingers. It was smeared with something sticky and he watched the whiskered man as he held it up to the light and studied the impressions. Then there was more confusion. Everyone talked at once

and the pompous one in purple made use of the radiovision, holding the square of glass near its disc for observation by the person he had called. The identification number was repeated aloud, a string of figures and letters that were a meaningless jumble to Karl. The room became quiet while the police captain thumbed the pages of a huge book he had taken from among many similar ones that filled a rack behind the desk.

Karl's blood froze in his veins at the rumbling swish of a car speeding through the pneumatic tube beneath their feet. His nerves were on edge. Then the captain of police looked up from the book and there was a peculiar glint in his eyes as he spoke.

"Peter Van Dorn. Missing since 2085. Wanted by Continental Government. Ha!"

The words came to Karl's ears through a growing sensation of unreality. It seemed that the speaker was miles away and that his voice and features were those of a radiovision likeness. Wanted by the great power across the Atlantic! It was unthinkable. Why, he had

been but an infant in 2085! What possible crime could he have committed? But the red police captain was speaking again, this time in a chill voice. And the room of the police, thick with the smoke of a dozen cigars, became suddenly stifling.

“Where have you been these twenty-three years, Peter Van Dorn?” asked the captain. “Who have you lived with, I mean?”

Something warned him to protect old Rudolph. And somehow he wished he had not treated the old fellow as he did when he left. His self-possession returned. A wave of hot resentment swept over him.

“That’s my affair,” he said defiantly.

The captain shrugged his shoulders. “Oh, well,” he said, “you needn’t answer—now. We’ll find out when it’s necessary. In the meanwhile we’ll have to turn you over to the Continental Ambassador.”

Two of the red police advanced toward him and the rest drew back.

“You mean I’m under arrest?” asked Karl incredulously.

“Certainly. Of course you’re not to be harmed.”

One of the guards had him by the arm and he saw the glint of handcuffs. They couldn’t do this! If it had been for rioting in the Square it would be different. But this! It meant he was a prisoner of a foreign government, for what reason he could not guess. He lost his head completely.

The captain cried out in amazement as one of his huskiest guards went sprawling under a well-planted punch. This youngster must be as crazy as was his father before him. But he was a whirlwind. Before he could be stopped he had tackled the other guard and with a mighty heave flung him halfway across the room where he fell with a thud that left him dazed and gasping. The pompous little man in the purple crawled under the desk as the sergeant leveled a slender tube at the young giant in gray.

Karl ducked instinctively at sight of the weapon, but

the spiteful crackle of its mechanism was too quick for him. A faintly luminous ray struck him full in the breast and stopped him in his tracks. A thrill of intense cold chased up his spine and a thunderbolt crashed in his brain. The captain caught his stiffened body as he fell.

Karl—refusing to think of himself as Peter Van Dorn—came to his senses as from a troubled sleep. His head ached miserably and he turned it slowly to view his surroundings. Then, in a flash, he remembered. The paralyzing ray of the red police! They never used it in the lower levels; but overhead—why, the swine! He sat suddenly erect and glared into a pair of green eyes that regarded him curiously.

A quick glance showed him that he was in a small padded compartment like that of the pneumatic tube cars. At one end there was an amazing array of machinery with glittering levers and handwheels—a control board on which numberless tiny lights blinked and flickered in rapid succession. At these controls squatted the twisted figure of a dwarf. A second of the creatures sat at his side and stared with those

horrible green eyes.

“Lord!” he muttered. “Am I still asleep?”

“No,” smiled the dwarf, “you’re awake, Peter Van Dorn.” The misshapen creature did not seem unfriendly.

“Then where am I, and who are you?”

“You’re in one of the Zar’s rocket cars, speeding toward Dorn. We are but two of the Zar’s servants—Moon men.”

“Rocket car? Moon men?” Karl was aghast. He wanted to pinch himself. But a hollow roar to the rear told him he was in a rapidly moving vessel of some sort. Certainly, too, these dwarfs were not figments of his imagination.

“You’ve been kept completely ignorant?” asked the dwarf.

“It—it seems so.” Karl was bewildered. “You mean we

are out in the open—traveling in space—to the Moon perhaps?”

The dwarf laughed. “No, I wish we were,” he replied. “But we are about halfway to the capital of the Continental Empire, greatest of world powers. We’ll be there in an hour.”

“But I don’t understand.”

“Stupid. Didn’t you ever hear of the rocket ships that cross the ocean like a projectile, mounting a thousand miles from the surface and making the trip in two hours?”

“No!” Karl was aghast. “Are we really in such a contraption?” he faltered.

“Say! Are you kidding me?” The dwarf was incredulous. “Do you mean to tell me you know so little of your world as that? Have you never read anything? The news broadcasts, the thought exchangers—don’t you follow them at all?”

Karl shook his head in growing wonder. Truly Rudolph had kept him in ignorance. Or was it his own fault? He had refused to dig into the volumes old Krassin had begged him to read. The broadcasts and the thought machines—well, only those of the purple had access to those.

“Hey, Laro!” called the dwarf to his companion, “this mole is as dumb as can be. Doesn’t know he’s alive hardly. And a Van Dorn!”

The two laughed uproariously and Karl raged inwardly. Mole! So that’s what they called wearers of the gray! He clenched his fists and rose unsteadily to his feet.

“Sorry,” apologized his tormentor. “Mustn’t get sore now. It seems so funny to us though. And listen, kid, you’ll never have another chance to hear it all. So, if you’ll sit down and calm yourself a bit I’ll give you an earful.”

Mollified, Karl listened. A marvelous tale it was, of a disgruntled scientist of the Eastern Hemisphere who

had conquered that portion of the world with the aid of the inhabitants he had found on the outer side of the Moon; of the scientist who still ruled the East—Zar of the Continental Empire. A horrible war—in 2085, the year of his own birth—depopulated the countries of Asia, Europe and Africa and reduced them to subjection. There was no combatting the destructive rays and chemical warfare of the Moon men. The United Americas, still weakened from a civil war of their own, remained aloof and, for some strange reason, the Zar left them in peace, contenting himself with his conquest of practically all of the rest of the world. Now, it seemed, the two major powers were as separate as if on different planets, there being no traffic between them save by governmental sanction; and that was rarely given.

It grew uncomfortably warm in the compartment as the rocket car entered the lower atmosphere but Karl listened spellbound to the astounding revelations of the Moon man. There came a pause in the discourse of the dwarf as a number of relays clicked furiously on the control board and the vessel slackened its

speed perceptibly.

“But,” said Karl, thinking aloud rather than meaning to interrupt, “what has all this to do with me? Why does the government of this Zar want me?”

The dwarf bent close and eyed him cautiously. “Poor kid!” he whispered, “it doesn’t seem right that you should suffer for something that happened when you were born; something you know nothing about. But the Zar knows best. You—”

There came a stabbing pencil of light from over Karl’s shoulder and the green eyes of the dwarf went wide with horrified surprise. He clutched at his breast where the flame had contacted, then slowly collapsed in a pitiful, distorted heap. Karl recoiled from the odor of putrefaction that immediately filled the compartment. He whirled to face the new danger but saw nothing but the padded walls.

Then they were in darkness save for the blinking lights of the control board. He was thrown forward violently and the piercing screech of compressed air

rushing past the vessel told him they had entered the receiving tube at their destination and were being retarded in speed for the landing. This much he had gathered from the explanations of the now silenced dwarf.

Laro, the other Moon man, remained mute at the controls. His companion evidently had talked too much.

The vessel had stopped and a section of the padded rear wall of the compartment moved back to reveal a second chamber. There were three other occupants of the ship and Karl knew now at whose hands the talkative Moon man had met his death. One of the three—all wearers of the purple—still held the generator of the dazzling ray in his hands. He decided wisely that resistance was useless and followed meekly when he was led from the ship.

Endlessly they rode upward in a high-speed lift, dismounting finally at a pneumatic tube entrance. A special car whisked them roaring into the blackness. Then they were shot forth into the open and Karl saw

the light of the sun for the first time in many years. They were on the upper surface of a great city, Dorn, the capital of the Continental Empire.

The air was filled with darting ships of all sorts and sizes, most of them being pleasure craft of the wearers of the purple. To Karl it was the sudden realization of his dreams. He was one of them. He, too, should be wearing the purple. Then his heart sank as one of his guards prodded him into action. His dream already was shattered for they stood at the entrance to a great crystal pyramid that rose from the flat expanse of the roofs of Dorn. It was the palace of the Zar.

It seemed then that fairyland had opened its gates to the young man in gray denim. He immediately fell under its influence when they traversed a long lane between rows of brightly colored growing things which filled the air with sweet odors. Feathered creatures fluttered about and twittered and caroled in the sheer joy of being alive. It was sweeter music than he had ever believed possible or even imagined as existing. Again he forgot the menace of the imperial

edict which had brought him from the other side of the world.

Then rudely, he was brought back to earth. He was in the presence of the mighty Zar and his three escorts were bowing themselves from the huge room in which the wizened monarch sat enthroned. They had finished their duties.

A shriveled face; beady eyes; trembling hands with abnormally large knuckles; a cruel and determined mouth—these were the features that most impressed Karl as he stared wordlessly at this Zar of the Eastern Hemisphere. The magnificence of the royal robe was lost on the young wearer of the gray.

“Well, well, so this is Peter Van Dorn, my beloved nephew.” The Zar was speaking and the chilly sarcasm in which the words were uttered belied the friendliness they otherwise might have implied.

“That’s what I’m told,” replied Karl, “though I didn’t know I’m supposed to be the nephew of so great a figure as yourself.”

Not bad that, for an humble wearer of the gray.

“Oh, yes, yes, indeed. Why else should I have sent for you?”

“I have wondered why—and still wonder.”

“Oh, you wonder, eh?” The Zar inspected him carefully and then broke into a cackle of horrible laughter. “A Van Dorn in gray denim!” he chortled. “A mole of the Americas! And to think that even the Zar has been unable to find him in all these years!”

“Stop!” bellowed Karl. “I’ll not have your ridicule. Come to the point now and have it over with. Kill me if you will, but tell me the story!” He had seen the slender tube in the Zar’s hand.

An expression of surprise, almost of admiration, flickered in the beady eyes of the Zar and was gone. He spoke coldly.

“Very well, I shall explain. You, Peter, are actually my nephew. Your father, Derek Van Dorn, was my

brother; he a king of Belravia and I a poor but experienced scientist. He scorned me and he paid, for I learned of the ancient race of the other side of the Moon, the side we can not see from the earth. I went to them and enlisted their aid in warring upon my brother. When we returned to carry on this war I learned that I had a son. So, too, did Derek. But my son was born in obscurity and Derek's son—you, Peter—in the lap of luxury. The war was short and, to me, sweet. Belravia was first to fall, and I had your father removed from this life by the vibrating death."

"You monster!" cried Karl. But the slender rod menaced him.

"A moment, my hot-headed nephew. I vowed I'd have your life, Peter, but your father had a few friends and one of these spirited you away. So temporarily you escaped. But now I have you where I can keep that vow. You, too, shall die. By the vibration. But first—ha! ha!—I'll give you a taste of the purple. Just so the going will be harder."

Karl kept his temper as best he could. He thought,

conscience-stricken, of old Rudolph, that good friend of his father. Then he thought of that youth he had taken from the Square.

“Your son?” he asked gently. “Has he the triangular brand?”

The Zar was taken aback. “He has, yes. Why?” he asked.

“I have seen him in the Americas. He now lies wounded and in peril of his life. What do you think of that?”

Karl was triumphant as the Zar paled.

“You lie, Peter Van Dorn!”

But the beady eyes saw that the young man was truthful. Sudden fury assailed the monarch of the East. A bell pealed its mellow summons and three Moon men entered the Presence.

“Quick, Taru—the radiovision! Our ambassador in the

Americas!” The Zar was on his feet, his hard features terrible in fear and anger. “By God!” he vowed, “I’ll lay waste the Americas if harm has come to my son. And you”—turning to Karl—“I’ll reserve for you an even more terrible fate than the vibrating death!”

The radiovision was wheeled in and in operation. A frightened face appeared in its disc: the Zar’s ambassador across the sea.

“Moreau—my son!” snapped the Zar. “Where is he?”

“Majesty! Have mercy!” gasped Moreau. “Paul has eluded us. He was skylarking—in the lower levels of New York. But our secret agents are combing the passages. We’ll have him in twenty-four hours. I promise!”

The rage of the Zar was terrible to see. Karl expected momentarily that the white flame would lay him low, for the anger of the mad ruler was directed first at Moreau, then at himself. But a quick, evil calm succeeded the storm.

“You, Peter,” he stated, in tones suddenly silky, “shall have that twenty-four hours—no more. If Moreau has not produced my son in that time you shall be dismembered slowly. A finger; an ear; your tongue; a hand—until you reveal the whereabouts of the heir to my throne!”

“Never! You scum!” Karl was on the dais in a single bound. He had the Zar by the throat, his fingers twisting in the flabby flesh. Might as well have it over at once. “Fratricide—murderer of my father, I’ll take you with me!”

But it was not to be. The throne room was filled with retainers of the mad emperor. Strong hands tore him away and he was borne, struggling and fighting, to the floor. A sharp pain in his forearm. A deadening of the muscles. He was powerless, save for the painful ability to crawl to his knees, swaying drunkenly. A delicious languor overcame him. Nothing mattered now. He saw that a tall man in the purple had withdrawn the needle of the hypodermic and was replacing the instrument in its case. Ever so slowly, it seemed.

The Zar was laughing. That horrible cackle. But Karl didn't care. They'd have their sport with him. Let 'em! Then it'd be over. Lord! If only he had been a little quicker. He'd have torn the old Zar's windpipe from its place!

"My word," laughed the Zar. "The sacred word of a Van Dorn. I gave it. He'll wear the purple for a day. Take him from my sight!"

Karl was walking, quite willingly now. The effects of the drug were altering. His muscular strength returned but his mental state underwent a complete change. Always he'd wanted a taste of the purple. For years he'd listened to the orators of the Square, to the conflicting statements of old Krassin. But now he'd see. He'd know the joys of the upper levels; the pleasure cities, perhaps. For one day. But what did it matter? He found himself laughing and joking with his companion, a heavy-set wearer of the purple. They were in a luxurious apartment. Servants! Moon men all of them, but so efficient. They stripped him of his gray denim; discarded it contemptuously. Karl kicked the heap into a corner and laughed delightedly. His

bath was waiting.

Much can happen in a day. Clothed in the purple, Karl—Peter Van Dorn, he was, now—expanded. Turgid emotions surged through his new being. He was a new man. In his rightful place. He was delighted with the companionship of his new friend of the purple, Leon Lemaire. An euphonious name! A fine fellow! Fool that the Zar must be, to leave him in the care of so amiable a man. Why, Leon couldn't hold him! None of them could. He'd escape them all—if he wished. Twenty-four hours, indeed!

They were in the midst of a gay company. Wine flowed freely, and Leon had attached to their party a pair of beautiful damsels, young, and easy to know. There was music and dancing. Lights of marvelous color played over the assemblage in the huge hall, swaying their senses at the will of some expert manipulator. Peter was a different person now. He was exhilarated to the point of intoxication, but not by the wine. Somehow he couldn't bear the taste of the amber fluid the others were imbibing with such gusto. The effects of the drug had left a coppery taste in his

mouth. But no matter! Rhoda, his lovely companion at the table leaned close. Her breath was hot at his throat. He swept her into his arms. Leon and the other girl laughed approvingly.

There were many such places in the upper levels of Dorn and they traveled from one to another. Now their party was larger, it having been augmented by the appearance of other of Leon's friends. Fine companions, these men of the purple, and the women were incomparable. Especially Rhoda. They understood one another perfectly now. It was all as he had pictured it.

Someone proposed that they visit the intermediate levels. It would be such a lark to watch the mechanicals. They made the drop in a lift. A laughing, riotous party. And Peter was one of them! He felt that he had known them for years. Rhoda clung to his arm, and the languorous glances from under her long lashes set the blood racing madly in his veins.

In the levels of the mechanicals they romped boisterously. To them the strange robots—creatures of

steel and glass and copper—were objects of ridicule. Poor, senseless mechanisms that performed the tasks that made the wearers of the purple independent of labor. Here they saw the preparation of their synthetic food, untouched by human hands. In one chamber a group of mechanicals, soulless and brainless, engaged in the delicate chemical compounding of raw materials that went into the making of their clothing. Here was a nursery, where tiny tots born to the purple were reared to adolescence by unfeeling but efficient mechanical nurses. The mothers of the purple could not be bothered with their offspring until they had reached the age of reason. The whirring machinery of a huge power plant provided much amusement for the feminine members of the party. It was all so massive; throbbing with energy. But dirty! Ugh! Lucky the attendants could be mechanicals.

“We have visited the lower levels,” whispered Rhoda in his ear, “but not often. It isn’t pleasant. Ignorant fools in the gray denim—too many of them. I don’t know why we permit their existence. Fools who will

not learn. Education made us as we are, and they won't take it. Sullen looks and evil leers are all that they have for us. Hope nobody suggests going down there now."

"Me, too," said Peter. He had forgotten that once he was Karl Krassin, a wearer of the despised gray.

Someone in the party was becoming restless. They must move on.

"Where to?" asked Peter.

"Sans Dolor, sweet boy. A pleasure city within a hundred kilometers of Dorn. You'll love it, Peter."

A pleasure city! Fondest dream of the wearers of the gray! In the dim past, when he was Karl, he had dreamed it often. Now he was to visit one!

They were atop the city now and the crystal palace of the Zar shimmered in the sunlight off there across the flat upper surface of Dorn. But it seemed so far away that Peter did not give it a second thought. He was

living in the present.

A swift aero took them into the skies and they roared out above the wilderness that was everywhere between the great cities of earth. Funny nobody thought of leaving the cities and exploring the jungles of the outside. But, of course, it wasn't necessary. They had everything they needed within the cities. All of their wants were supplied by the mechanicals and by the few toilers in the gray who still persisted in ignorance and in some perverse ideas that they must work in order to live. Besides, the jungle was dangerous.

Sans Dolor loomed into view, a great island floating in the air a thousand meters above the tossing waters of the ocean. Peter gave not a thought to the forces that kept it suspended. Dimly he recalled certain words of old Rudolph, words regarding the artificial emanations that had been discovered as capable of counteracting the force of gravity. But his mind was intent on the pleasures to come.

They were over the city. Carefully tended foliage lined

its streets and a smooth lagoon glistened in its center. Its towers and spires were decorated with gay colors. The streets were filled with wearers of the purple and the nude bodies of bathers in the lagoon gleamed white in the strong sunlight.

He sensed anew the nearness of Rhoda. Her soft warm hand nestled in his and she responded instantly to his sudden embrace.

There came a shock and the party was stilled in dismay. The aero careened violently and the pilot struggled with controls that were dead. Sans Dolor dropped rapidly away beneath them. They were shooting skyward, drawn by some inexplicable and invisible energy from above.

Rhoda screamed and held him close, trembling violently. All of the women screamed and the men cursed. Leon arose to his feet and stared at Peter. The friendliness was gone from his features and he spat forth an accusation. A glistening mechanism appeared in his hand as if by magic. A ray generator! He had been appointed by the Zar to guard this upstart and,

whatever happened, he'd not let him escape with his life. The girl shuddered at sight of the weapon and extricated herself from his arms. Her affection too had been a pose.

Peter's mind was clearing from the effects of the drug. He had not the slightest idea of what might have caused the quick change in the situation but he resolved he would die fighting, if die he must. Leon fumbled with the catch of the generator. It refused to operate. The force that was drawing them upward had paralyzed all mechanisms aboard the little aero. Flinging it from him in disgust he sprang for Peter.

Their minds befuddled, the rest of the men watched dully. The women huddled together in a corner, whimpering. They were a sorry lot after all, thought Karl. He was no longer Peter Van Dorn, and he thrilled to the joy of battle.

Leon Lemaire was no mean antagonist. His flailing arms were everywhere and a huge fist caught Karl on the side of his head and sent him reeling. But this only served to clear his mind further and to fill him

with a cold rage. He bored in unmercifully and Lemaire soon was on the defensive. A blow to his midsection had him puffing and Karl hammered in rights and lefts to the now sinister face that rocked his opponent to his heels. But the minion of the Zar was crafty. He slid to the floor as if groggy, then with catlike agility, dove for Karl's knees, bringing him down with a crash.

The air whistled by them as the ship was drawn upward with ever-increasing speed. The other passengers cowered in fright as the two men rolled over and over on the floor, banging at each other indiscriminately. Both were hurt. Karl's lip was split, and bleeding profusely. One eye was closing. But now he was on top and he pummeled his opponent to a pulp. Long after he ceased resisting them, the blows continued until the features of Leon Lemaire were unrecognizable. The infuriated Karl did not see that one of the members of the party was creeping up on him from behind. Neither was he aware that the upward motion of the aero had ceased and that they now hung motionless in space. A terrific blow at the

base of his skull sent him sprawling. Must have been struck by a rocket, one of those funny ships that crossed the ocean so quickly. A million lights danced before his aching eyeballs.

Lying prone across the inert body of his foe, dimly conscious and fingers clutching weakly, he knew that the cabin was filled with people. Alien voices bellowed commands. There was the screaming of women; the sound of blows; curses ... then all was silence and darkness.

It was a far cry to the little book shop off Cooper Square, but Karl was calling for Rudolph when he next awoke to the realization that he was still in the land of the living. His head was bandaged and his tongue furry. A terrible hangover. Then he heard voices and they were discussing Peter Van Dorn. He opened one eye as an experiment. The other refused to open. But it might have been worse. At least he was alive; he could see well enough with the one good optic.

“Sh-h!” whispered one of the voices. “He’s

recovering!”

He looked solemnly into the eyes of an old man; a pair of wise and gentle eyes that reminded him somehow of Rudolph's.

“Quiet now, Peter,” said the old man. “You’ll be all right in a few minutes. Banged up a bit, you are, but nothing serious.”

“Don’t call me Peter,” objected Karl. He loathed the sound of the name; loathed himself for his recent thoughts and actions. “I am Karl Krassin,” he continued, “and as such will remain until I die.”

There were others in the room and he saw glances of satisfaction pass between them. This was a strange situation. These men were not of the purple. Neither were they of the gray. Their garments shone with the whiteness of pure silver. And that’s what they were; of finely woven metallic cloth. Was he in another world?

“Very well, Karl.” The kind old man was speaking once more. “I merely want you to know that you are

among friends—your father’s friends.”

Surprised into complete wakefulness, Karl struggled to a seated position and surveyed the group that faced him. They were a fine looking lot, mostly older men, but there was a refreshing wholesomeness about them.

“My father?” he faltered. “He’s not alive.”

“No, my poor boy. Derek Van Dorn left this life at the hands of your uncle, Zar Boris. But we, his friends, are here to avenge him and to restore to you his throne.”

“But—but—I still do not understand.”

“Of course not, because we’ve kept ourselves hidden from the world for more than twenty-two years, waiting for this very moment. There are forty-one of us, including Rudolph, my brother. We have lived in the jungle since Boris conquered the Eastern Hemisphere. But amongst our numbers were several scientists, two greater than was Boris, even in his

heyday. They have done wonderful things and we are now prepared to take back what was taken from Derek—and more. His life we can not restore—Heaven rest him—but his kingdom we can. And to his son it shall be returned.

“You were given into Rudolph’s care when little more than a babe in arms and he has cared for you well. We’ve watched, you know, in the detectoscopes—long range radiovision mechanisms that can penetrate solid walls, the earth itself, to bring to us the images and voices of persons who may be on the other side of the world. We’ve followed your every move, my boy, and the first time we feared for you was yesterday when the drug of the Zar’s physician stole away your sense of right and wrong. But we were in time to save you, and now we are ready to kneel at your feet and proclaim you our king. First there is the Zar to be dealt with and then we shall set up the new regime. Are you with us?”

Karl gazed at the speaker in wonder. He a king? Always to live amongst the wearers of the purple? To be responsible for the welfare of half the world? It

was unthinkable! But Zar Boris, the murderer of his own father—he must be punished, and at the hands of the son!

“I’ll do it,” he said simply. “That is, I’ll do whatever you have planned in the way of exterminating the Zar. Then we’ll talk of the new empire. But how is the Zar to be overcome? I thought he was invincible, with his Moon men and terrible weapons.”

“Ah! That, my boy, is where our scientists have triumphed. True, his rays were terrible. They could not be combatted when he first returned. The strange chemicals and gases of the Moon men defied analysis or duplication. His citadel atop the city of Dorn is proof against them all; proof against explosives and rays of all kinds known to him. The disintegration and decomposition rays have no effect on the crystal of its walls. It is hermetically sealed from the outer air so can not be gassed. The vibration impulses have no effect upon its reinforced structure. But there is a ray, a powerful destructive agent, against which it is not proof. And our scientists have developed this agency. You shall have the privilege of pressing the release of

the energy that destroys the arch-fiend in his lair. His dominance over, the empire will fall. We shall take it—for you.”

A strange exaltation shone from the faces of those in the room, and Karl found that it was contagious. His bosom swelled and he itched to handle the controls of this wonderful ray.

“This ray,” continued the brother of old Rudolph, “carries the longest vibrations ever measured, the vibrations of infra-red, the heat-ray. We have succeeded in concentrating a terrific amount of power in its production, and with it are able to produce temperatures in excess of that of the interior of the earth, where all substances are molten or gaseous. The Zar’s crystal palace cannot withstand it for a second. He cannot escape!”

“How’ll you know he’s there at the time?” Karl was greatly excited, but he was curious too.

“Come with me, my boy. I’ll show you.” The old man led him from the room and the others followed

respectfully.

They stopped at a circular port and Karl saw that they were high above the earth in a vessel that hovered motionless, quivering with what seemed like human eagerness to be off.

“This vessel?” he asked.

“It’s a huge sphere; the base of our operations. To it we drew the aero on which you were fighting. A magnetic force discovered by our scientists and differing only slightly from that used in counteracting gravity. We let the rest of them go; foolishly I think. But it’s done now and we have no fear. From this larger vessel we shall send forth smaller ones, armed with the heat-ray. The flagship of the fleet is to be yours and you’ll lead the attack on Dorn. Here—I’ll show you the Zar.”

They had reached the room of the detectoscopes—a mass of mechanisms that reminded Karl of nothing so much as the vitals of the intermediate levels which he had visited with Leon—and Rhoda. He knew that he

flushed when he thought of her. What a fool he had been!

A disc glowed as one of the silver-robed strangers manipulated the controls. The upper surface of Dorn swung into view. Rapidly the image drew nearer and they were looking at the crystal pyramid that was the Zar's palace. Down, down to its very tip they passed. Karl recoiled from the image as it seemed they were falling to its glistening sides. The sensation passed. They were through, penetrating solid crystal, masonry, steel and duralumin girders. Room after room was opened to their view. It was magic—the magic of the upper levels.

Now they were in the throne room. A group of purple-clad men and women stood before the dais. Leon, Rhoda—all of his wild companions were there, facing the dais. The Zar was raging and the words of his speech came raucously to their ears through the sound-producing mechanism.

“You’ve failed miserably, all of you,” he screamed.

“He’s gotten away and you know the penalty. Taru—

the vibrating ray!”

The Moon man already was fussing with a gleaming machine, a machine with bristling appendages having metallic spheres on their ends, a machine in which dozens of vacuum tubes glowed suddenly.

Rhoda screamed. It was a familiar sound to Karl. He noted with satisfaction that Leon could hardly stand on his feet and that his face was covered with plasters. Then, startled, he saw that Leon was shivering as with the ague. His outline on the screen grew dim and indistinct as the rate of vibration increased. Then the body bloated and became misty. He could see through it. The vibrating death! His father had gone the same way!

Karl groaned at the thought. The whine of the distant machine rose in pitch until it passed the limit of audibility. Tiny pin-points of incandescence glowed here and there from the Zar’s victims as periods of vibration were reached that coincided with the natural periods of certain of the molecules of their structure. They were no longer recognizable as

human beings. Shimmering auras surrounded them. Suddenly they were torches of cold fire, weaving, oscillating with inconceivable rapidity. Then they were gone; vanished utterly.

The Zar laughed—that horrible cackle again.

“Great God!” exclaimed Karl, “let’s go! The fiend must not live a moment longer than necessary. Are you ready?”

Rudolph’s brother smiled. “We’re ready Karl,” he said.

The great vessel hummed with activity. The five torpedo-shaped aeros of the battle fleet were ready to take off from the cavities in the hull. In the flagship Karl was stationed at the control of the heat-ray. His instructions in its operation had been simple. A telescopic sight with crosshairs for the centering of the object to be attacked; a small lever. That was all. He burned with impatience.

Then they were dropping; falling clear of the mother

ship. The pilot pressed a button and the electronic motors started. A burst of roaring energy streamed from the tapered stern of their vessel and the earth lurched violently to meet them. Down, down they dived until the rocking surface of Dorn was just beneath them. Then they flattened out and circled the vast upper surface. From the corner of his eye Karl saw that the other four vessels of his fleet were just behind. There was a flurry among the wasplike clouds of pleasure craft over the city. They scurried for cover. Something was amiss!

“Hurry!” shouted Karl. “The warning is out! There is no time to lose!”

He pressed his face to the eye-piece of his sight, his finger on the release lever of the ray. The crystal pyramid crossed his view and was gone. Again it crossed, more slowly this time. And now his sight was dead on it, the gleaming wall rushing toward him. Pressure on the tiny button. They’d crash into the palace in another second! But no, a brilliant flash obscured his vision, a blinding light that made the sun seem dark by comparison. They roared on and

upward. He took his eye from the telescope and stared ahead, down. The city was dropping away, and, where the crystal palace had stood, there was a spreading blob of molten material from which searing vapors were drifting. The roofs of the city were sagging all around and great streams of the sparkling, sputtering liquid dripped into the openings that suddenly appeared. Derek Van Dorn was avenged.

“Destroy! Destroy!” yelled Karl madly. A microphone hung before him and his words rang through every vessel of his convoy.

The lust of battle was upon him. A fleet of the Zar’s aeros had risen from below; twenty of them at least. These would be manned by Moon creatures, he knew, and would carry all of the dreadful weapons which had originated on that strange body. But he did not know that his own ships were insulated against most of the rays used by the Zar’s forces. He knew only that he must fight; fight and kill; exterminate every last one of the Zar’s adherents or be exterminated in the attempt.

Kill! Kill! The madness was contagious. His pilot was a marvel and drove his ship straight for the massed ships of the foe. The air was vivid with light-streamers. A ray from an enemy vessel struck the thick glass of the port through which he looked and the outer surface was shattered and pock-marked. But a cloud of vapor and a dripping stream of fiery liquid told him his own ray had taken effect on a vessel of the enemy. One! They wheeled about and spiraled, coming up under another of the Zar's aeros. It vanished in a puff of steam and they narrowly missed being covered by the falling remnants of incandescent liquid. Two! Karl's aim was good and he gloated in the fact. Three! They climbed and turned over, dropping again into the fray. Four!

The air grew stifling, for the expended energy of the enemies' rays must needs be absorbed. It could not disintegrate them nor decompose their bodies, but the contacts were many and the liberation of heat enormous. They were suffocating! But Karl would not desist. They drove on, now beneath, now above an enemy ship. He lost count.

One of his own vessels was in trouble. The report came to him from the little speaker at his ear. He looked around in alarm. A glowing object reeled uncertainly over there between two of the aeros of the Zar. The concentration of beams of vibrations was too much for the sturdy craft. It was red hot and its occupants burned alive where they sat. Suddenly it slipped into a spin and went slithering down into the city, leaving a gaping opening where it fell. This sobered him somewhat, but he went into the battle with renewed fury.

How many had they brought down? Fifteen? Sixteen? He tore his purple jacket from his body. The perspiration rolled from his pores. His own ship would be next. But what did it matter? Kill! Kill! He shouted once more into the microphone, then dived into battle. Another and another! In Heaven's name, how many were there? It was maddening. If only he could breathe. His lungs were seared; his eyes smarting from the heat. And then it was over.

Three of the Zar's aeros remained, and these turned tail to run for it. No! They were falling, nose down,

under full power; diving into the city from which they had come. Suicide? Yes. They couldn't face the recriminations that must come to them. And anything was better than facing that burning death from the strange little fighters which had come from out the skies. Dorn was a mass of wreckage.

Karl tore at the fastenings of the ports, searing his fingers on the heated metal. His pilot had collapsed, the little aero heading madly skyward with no guiding hand. Air! They must have air! He loosened the pilot's jacket; slapped frantically at his wrists in the effort to bring him to consciousness. Then he was at the controls of the vessel, tugging on first one, then the other. The aero circled and spun, executing the most dangerous of sideslips and dives. A little voice was speaking to him—the voice of the radio—instructing him. In a daze he followed instructions as best he could. The whirlings of the earth stabilized after a time and he found he was flying the vessel; climbing rapidly.

A sense of power came to him as the little voice of the radio continued to instruct. Here were the controls of

the electronic motor; there the gravity-energy. He was proceeding in the wrong direction. But what did it matter? He learned the meaning of the tiny figures of the altimeter; the difference between the points of the compass. Still he drove on.

“East! Turn East!” begged the little voice from the radio. “You’re heading west. Your speed—a thousand kilometers an hour—it’s too fast. Turn back, Zar Peter!”

He tore the loud speaker of the radio from its fastenings. West! He wanted to go west! On and on he sped, becoming more and more familiar with the workings of the little vessel as he progressed. A cooling breeze whistled from the opened ports, a breeze that smelled of the sea. His heart sang with the wonder of it all. He could fly. And fly he did. Zar Peter? Never! He knew now where he belonged; knew what he wanted. He’d find the coast of North America. Follow it until he located New York. A landing would be easy, for had not the voice instructed him in the use of the gravity-energy? He’d make his way to the lower levels, to the little book

shop of Rudolph Krassin. A suit of gray denim awaited him there and he'd never discard it.

Onward he sped into the night, which was falling fast. He held to his westward course like a veteran of the air lanes. The pilot had ceased to breathe and Karl was sorry. Game little devil, that pilot. Have to shove his body overboard. Too bad.

Rudolph's brother would understand. He'd be watching in the detectoscope. And the others—those who had wished to seat him on a throne—they'd understand, too. They'd have to!

Rudolph would forgive him, he knew. Paul Van Dorn—his own cousin—the secret agents of the Zar would never locate him! Too many friends of Rudolph's were of the red police.

He gave himself over to happy thoughts as the little aero sped on in the darkness. Home! He was going home! Back to the gray denim, where he belonged and where now he would remain content.

#63 The Ape-men Of Xlotli, By David R. Sparks:

A beautiful face in the depths of a geyser—and Kirby plunges into a desperate mid-Earth conflict with the dreadful feathered serpent.

his hiss filled the night

- - -

Chapter 1

Kirby did not know what mountains they were. He did know that the Mannlicher bullets of eleven bad Mexicans were whining over his head and whizzing past the hoofs of his galloping, stolen horse. The shots were mingled with yelps which pretty well curdled his spine. In the circumstances, the unknown range of snow mountains towering blue and white beyond the

arid, windy plateau, offering he could not tell what dangers, seemed a paradise. Looking at them, Kirby laughed harshly to himself.

A beautiful face in the depths of a geyser—and Kirby plunges into a desperate mid-Earth conflict with the dreadful Feathered Serpent.

As he dug the heels of his aviator's boots into the stallion's flanks, the animal galloped even faster than before, and Kirby took hope. Then more bullets and more yelps made him think that his advantage might prove only temporary. Nevertheless, he laughed again, and as he became accustomed to the feel of a stallion under him, he even essayed a few pistol shots back at the pack of frantic, swarthy devils he had fooled.

Three hours ago he had been eating a peaceful breakfast with his friend and commandant, Colonel Miguel de Castanar, in the sunlit patio of the commandant's hacienda. Castanar, chief of the air patrol for the district, had waxed enthusiastic over the suppression of last spring's revolutionists and the

cowed state of up-country bandits. Captain Freddie Kirby, American instructor of flying to Mexican pilots in the making, had agreed with him and asked for one of the Wasps and three days' leave with which to go visiting in Laredo. The simple matter of a broken fuel line, a forced landing two hundred kilometres from nowhere, and the unlucky proximity of the not-so-cowed horsemen, were the things which had changed the day from what it had been to what it was.

The one piece of good fortune which had befallen him since the bandits had surrounded the wrecked Wasp, looted it, and taken its lone pilot prisoner, was the break he was getting now. During the squadron's first halt to feed, he had knocked down his guards and made a bolt for the grazing stallion. So far, the attempt was proving worth while.

On and on the stallion lunged toward the white mountains. Kirby's eyes became red rimmed now from fatigue and the glare of the sun and the dust of the pitilessly bare plateau. A negligible scalp wound under his mop of straw-colored hair, slight as it was, did not add to his comfort. But still he would not give

up, for the horse, as if it sensed what its rider needed most, was making directly for a narrow ravine which debouched on the plateau from the nearest mountain flank.

It was the promise of cover afforded by the jagged rocks and jungle growth of that ravine which kept hope alive in Kirby's throbbing brain.

The stallion was blown and staggering. Foam from the heavily bitten mouth flashed back in great yellow flakes against Kirby's dust-caked aviator's tunic. But just the same, the five mile gallop had carried both horse and rider beyond range of any but the most expert rifle shot. And Kirby knew that if his own splendid mount was almost ready to crash, the horses of his pursuers must be in worse shape still. So for the third time since the fight had begun, he laughed. This time there was no harshness, but only relief, in the sound which came from his dry lips.

Ten minutes later, he flung himself out of his saddle. Like the caress of a vast, soothing hand, the shadowed coolness of the ravine lay upon him. As his

feet struck ground, they splashed in the water overflowing from a spring at the base of an immense rock. At once Kirby dropped the reins on the stallion's neck, giving him his freedom, and as the horse lowered his head to drink, Kirby stooped also.

There was cover everywhere. Kirby's first move after pulling both himself and the horse away from the spring, was to glance up the long, deeply shaded canyon which he had entered—a gash hacked into the breast of the steep mountain as by a titanic ax. Then, reassured as to the possibilities for a defensive retreat, he glanced back toward the dazzling, bare plateau.

It was what he saw taking place amongst the sombreroed bandits out there which made the grin of satisfaction fade from his broad mouth. His last glance backward, before bolting into the canyon mouth, had showed him a ragged squadron of men left far behind, yet galloping after him still. But now—

Presently a puzzled frown made wrinkles in Freddie Kirby's wide sunburned forehead. He relaxed his grip

upon the heavy Luger, which, in his big hands, looked like a cap pistol, and rubbed his eyes.

But he was not mistaken. The horsemen had halted! Out there on the glaring, alkali-arid plateau, they were standing as still as so many statues. Looking toward the canyon mouth which had swallowed their quarry, they certainly were, but they were halted as completely as men struck dead.

“Huh,” Kirby grunted, and scratched behind his ear.

The next second he swung around to look at his horse, uncertain what he was going to do next, but aware of the fact that right now, with a lot of unknown country between himself and Castanar’s sunlit patio, the stallion was going to be a friend in need.

As he turned, however, prepared to take up the loose reins, something else happened. The stallion let out a neigh as shrill as a trumpet blast. As Kirby jumped, grabbed for the bridle, his fingers found empty air. Like a crazy animal the stallion leaped past him,

barely missing him. Out toward the plain the horse jumped, out and away from the shaded canyon mouth, out toward the spot where other horses waited. And despite the animal's blown condition, the speed he put into his retreat left Kirby dazed.

After a helpless, profanity-filled second, Kirby scratched behind his ear again. As certain as the fact that almost his sole hope of getting back to civilization depended upon the stallion, was the fact that the brute did not intend to stop running until he dropped.

"Now what in the hell ever got into his crazy head?" Kirby muttered grimly.

Then he turned around to glance up the shadow-filled slash of a canyon, and sniffed.

"Huh!"

Faintly in the air had risen an odor the like of which he had never encountered in his life. A combination, it was, of the unforgettable stench which hangs over a

battlefield when the dead are long unburied, and of a fragrance more rare, more heady, more poignantly sweet than any essence ever concocted by Parisian perfumer.

With the drifting scent came a sound. Faint, carrying from a distance, the rumble which Kirby heard was almost certainly that of a geyser.

There was no telling what had brought the troop of horsemen to a halt, but after a time Kirby knew that the cause of his horse's sudden departure must have been a whiff of the strange perfume.

For a long time he stood still, watching the crazy stallion dwindle in size, watching the line of unexpectedly timid bandits. Then, when it became apparent that the horsemen were going to stay put either until he came out, or showed that he never was coming out, he shrugged, and swung on his heel so that he faced up the canyon.

The odor was dying away now, and the geyser rumble was gone. In Kirby's heart came a mingled feeling of

tense uneasiness and fascinated curiosity.

Momentarily he was almost glad that his horse *had* bolted, and that his pursuers *were* blocking any lane of retreat except that offered by the canyon. If things had been different, the queer behavior of the Mexicans, the unaccountable actions of his horse and the equally strange growth of his own uneasiness might have made him uncertain whether he would go up the canyon or not. Now it was the only thing to do, and Kirby was glad because, fear or no fear, he wanted to go on.

“I wonder,” he said out loud as he started, “just what the denizens of First Street in Kansas would say to a layout like this!”

Chapter 2

At the end of an hour he was still wondering.

At midday the canyon was chill and dank, lit only by a half light which at times dwindled to a deep dusk as the rock walls beetled together hundreds of feet above his head. Always when he stumbled through one of the darkest passages, he heard and half saw immense gray bats flapping above him. In the half-lit reaches, he hardly took a step without seeing great rats with gray coats, yellow teeth, and evil pink eyes. But rats and bats combined were not as bad as the snakes. They were almost white, and nowhere had he seen rattlers of such size. If his caution relaxed for a second, they struck at him with fangs as long and sharp as needles.

The tortured, twisted cedars, the paloverdi, occatilla, cholla, opunti, through which he edged his laborious way, all offered an almost animate, armed hostility.

Altogether this journey was the least sweet he had taken anywhere. Yet he went on.

Why had eleven Mexican bandits refused to advance even to within decent rifle range of the canyon's mouth? What was there about the putrid yet gorgeous perfume that had made the stallion go off his nut, so to speak?

After a time, Kirby veered away from a fourteen-foot rattler which flashed in a loathsome coil on his left hand. Hungry, weakened by all he had been through since breakfast time, he plodded doggedly on.

But a moment later he stumbled past a twisted cedar, and then stopped, forgetting even the snakes.

At his feet lay the bleached skeleton of a man.

Beside the right hand, in a position which indicated that only the final relaxation of death had loosened his grip upon a precious object, lay a cylinder, carefully carved, of rich, yellow gold.

Of the science of anthropology Kirby knew enough to make him sure that the dolicocephalic skull and characteristically shaped pelvic and thigh bones of

the skeleton had belonged to a white man.

As for the cylinder—But he was not so sure what that was.

Regardless of the dry swish of a rattler's body on the rocks behind him, he lifted the object from the spot in which it had lain for no man knew how long. Of much the size and shape of an old-time cylindrical wax phonograph record, the softly gleaming thing weighed, he judged, almost two pounds.

Two pounds of soft, virgin gold of a quality as fine as any he had seen amongst all the treasures brought out of Mexico, Yucatan, and Peru combined!

But the gold was not the only thing. If Kirby was human enough to think in terms of treasure, he was also enough of an amateur anthropologist to hold his breath over the carvings on the yellow surface.

First he recognized the ancient symbols of Sun and Moon. And then a representation, semi-realistic, semi-conventionalized, of Quetzalcoatl, the Feathered

Serpent, known in all the annals of primitive Mexican religions.

Good enough.

But the mere symbols by no means told the whole story of the cylinder. The workmanship was archaic, older than any Aztec art Kirby knew, older than Toltec, older far, he ventured to guess, than even earliest archaic Mayan carvings.

God, what a find!

For a moment it seemed almost impossible that he, Freddie Kirby, native of Kansas, unromantic aviator, should have been the one to discover this relic of an unknown, lost race. Yet the cylinder of gold was there, in his hand.

After a long minute Kirby looked around him, then listened.

From up the canyon came the provocative rumble of the geyser. It was closer now, and Kirby, glancing at

his watch which had been spared to him in the Wasp's crash, noted that just forty-four minutes had passed since the last eruption. There was nothing to be done about the bleached skeleton. So, tucking the precious cylinder into his tunic, Kirby headed on up the gash of a canyon.

Far away indeed seemed the neat, maple-shaded asphalt street, the rows of parked cars and farm wagons, the telephone office and drug store and bank, of the Kansas town where he had grown up.

Time passed until again he heard the geyser, and again was dizzied by the perfume. As the fragrance—close and powerful now—died away, he flailed with one arm at a two-foot bat which flapped close to his head.

And then he trudged his dogged way around a deeply shadowed bend, and found the chasm not only almost wholly dark, but narrower than it had been at any previous point.

“Holy mackerel,” Kirby groaned. “Phew! If this keeps

up, I—”

He stopped. His jaw dropped.

“Oh, hell!”

The beetling walls narrowed in until the gash was scarcely fifteen feet wide. Further progress was barred by a smooth wall which rose sheer in front of him.

Kirby did not know how many seconds passed before he made out through the gloom that the wall was man-made and carved with the same symbols of Sun, Moon, and Feathered Serpent, which ornamented the cylinder of gold. But when he did realize at last, the shout with which he expressed his feeling was anything but a groan.

It simply meant that the skeleton which once had been a man, had almost surely found the golden cylinder beyond the wall and not in the canyon. And if the dead man had passed that smooth, carved barrier, another man could do it!

Kirby jumped forward, began to search in the darkness for some hidden entrance.

Minute after minute passed. He gave another cry. He saw a long, upright crack in the stone surface, and a quick push of his hands made the stones in front of him give almost an inch.

All at once his shoulder was planted, and behind that square shoulder was straining all the muscle of his two hundred pound body. The result was all that he desired. When he ceased pushing, a slab of rock gaped wide before him, giving entrance to a pitch dark tunnel.

For a moment he held the portal back, then, releasing his pressure, he stepped into the dark passage. By the time a ponderous grating of rocks assured him that the door had swung shut of its own weight, he had produced matches and struck a light.

The puny flame showed him a curving passage hewn smoothly through the heart of bedrock. Before the flare died he walked twenty feet, and as another

match burned to his fingers, he found the right hand curve of the passage giving way to a left hand twist. After that he dared use no more of his precious matches. But just when the darkness was beginning to wear badly on his nerves, he uttered a low cry.

As he increased his rapid walk to a run, the faint light he had suddenly seen ahead of him grew until it became a circular flare of daylight which marked the tunnel's end.

Out of the passage Kirby strode with shoulders square and head up, his cool, level, practical blue eyes wide with wonder. Out of the tunnel he strode into the valley of the perfumed geyser.

“God above!”

The words were vibrant with hoarse reverence. He saw the sunlight of a cliff-surrounded diminutive Garden of Eden. He saw a vale of flowering grass, of palms and live oaks, saw patches of lilies so huge as to transcend belief, and dizzying clumps of tree cactus almost as tall as the palms themselves.

What was more, he saw in the center of this upland, cliff-guarded valley, a gaping black orifice which every faculty of judgment told him was the mouth of the geyser of perfume. And beside it, outstretched on a smooth sheet of rock which glistened as though coated with a layer of clear, sparkling glass, he saw—

Kirby blinked his eyes rapidly, hardly believing what he saw.

On the glistening rock lay the perfectly preserved figure of a Spanish Conquistadore in full armor. Morion and breast-plate were in place, and glistened as though they had been burnished this morning. And the Spaniard's dark, handsome, bearded face! Kirby saw instantly that no decay had touched it, that even the hairs of the beard were perfect. The whole armor-clad corpse gleamed softly with a covering of the same glassy substance which covered the rock.

Kirby glanced at his watch, saw that twelve minutes must elapse before the geyser spouted again. Then his eyes narrowed. He remained standing where he was, hard by the mouth of the tunnel, knowing that a

wise man would conduct cautiously his exploration of this valley of wonders.

Arsenic! Silicon!

The two words stood out sharply in his thought. In Africa existed plenty of springs whose waters contained enough arsenic to bring death to those who drank. Might not the Spaniard's presence here be explained, then, by assuming that the geyser water was charged with a strong arsenic content, and, in addition, with some sort of silicon solution which, left to dry in the air, hardened to glass?

Lord, what a discovery to take back with him to Kansas! Almost it made the discovery of the golden cylinder pale by comparison. Why, the commercial uses to which this silicon water might be put were almost without limit, and the owner of the concession might confidently expect to make millions!

It was while Kirby stood there, breathless and jubilant, waiting for the geyser to spout, that he began to feel that *he was being watched*.

Suddenly, with a start, he shot a sweeping glance over the whole grove. But that did no good. He saw nothing save sunlight and waving green leaves.

Eleven days were to pass before he discovered all that was to be involved in that sensation of being gazed at by unseen eyes.

Chapter 3

At the beginning of the eleventh morning in the valley, Kirby had again posted himself close to the mouth of the black tunnel, and again felt that hidden eyes were observing him.

But this morning differed from the first morning, because now, for the first time, he was ready to do something about the watcher or watchers.

Exploration of the whole valley had not helped.

Therefore, there lay at his feet a considerable coil of rope, the manufacture of which from plaited strands of the tough grass in his Eden had taken him whole days. With what patience he could find, he was waiting for the gigantic spout of milky-colored, perfumed water which would mean that the geyser had gone off and would erupt no more for exactly forty-four minutes.

Eleven days in the valley!

While he waited, Kirby considered them. Who had made the beautiful footprints beside him, when he

had slept at last after his arrival here? Why had so many of the queer, fuzzy topped shrubs with immense yam-shaped roots, which grew here been taken away during that first sleep, and during all his other periods of sleep? Who had taken them? Early in his stay, he had learned that the tuberlike roots were good to eat and would sustain life, and he supposed that the unseen people of the valley took them for food. But who were these people of the valley?

Who had laid beside him during his first sleep the immense lily with perfume like that which came with the milky geyser spray—that spray of death and delight mingled? Why had someone scratched a line in the earth from him directly to the distant orifice of the geyser? Was this, as he believed, a signal to come not only to the edge of the orifice, *but to lower himself down into its depths?* And if the line were intended as a signal, did the persons who came to the valley while he slept, always eluding him, wish him well or mean to do him harm?

Last question of all: had the beautiful girl's face he believed he had seen just once, been real or an

hallucination? It had been while he was kneeling at the very edge of the geyser cone, staring down its many colored throat, that the vision had appeared. Misty white amidst the green gloom, the face had been turned up to him, smiling, its lips forming a kiss, and its great eyes beckoning. Had the face been real or a dream?

Eleven days in the valley! Now, with his braided rope ready at last, he was going to do something which might help to answer his questions.

Kirby reached out and began to run his grass rope, yard by yard, through his hands, searching carefully for any flaw. A canyon wren made the air sweet above him, while the morning sun began to wink and blink against the shadows which still lay against the face of the guardian cliffs. Kirby glanced at his watch and got up.

Crossing beyond the mouth of the geyser, he grinned good morning at his friend the Conquistadore, and marched on into the shade of the live oak which grew nearest the geyser. Here he made one end of his rope

fast to the gnarled trunk, inspected his pistol, patted his tunic to make sure that the cylinder of gold was safe, then stood by to await the geyser.

With the passing of three minutes there came from the still empty orifice a sonorous rumbling. Kirby grinned.

From deep in the earth issued a sound of fizzing and bubbling, and then, to the accompaniment of subterranean thunder, burst loose the milky, upward column which had never ceased to awe the man who watched so eagerly this morning. As the titanic jet leaped skyward now, the slanting rays of the sun caught it, and turned the water, fanning out, into a fire opal, into a sheet of living color.

Kirby, hard headed to the last, drew from the supply in one pocket of his tunic, a strip of one of the tuberlike roots, and munched it.

The thunder ceased. The waters receded.

After that Kirby hesitated not a second. Promptly he

moved forward, flung his coil of line down into the geyser tunnel, and swung on to the line. By the time he had swallowed the last bite of his breakfast, the world he knew had been left behind, and he was climbing down to a new.

It became at once apparent that the gorgeously colored, glassy-smooth throat glowed with tints which were unfamiliar to him. He could perceive these new shades of color, yet had no name for them.

As he stopped after fifty feet to breathe, the color phenomenon made him wonder if the tuber roots he had been eating had affected his vision; then decided they had not. In addition to food value, the roots had some power to stimulate courage and a slight mental exhilaration. But the drug had proved non-habit forming, and Kirby knew that his powers of perception were not now, and never had been, affected.

He swung down further.

Just a moment after he began that progress was when

things began to happen to him. First he heard what seemed to be the low titter of a human voice laughing sweetly. Next came a far off, unutterably lovely strumming of music. And then he realized that, at a depth of about a hundred feet, he was hanging level with a hole which marked the mouth of another tunnel.

This new tunnel sloped down into the earth on his right hand. The floor and walls were glassy smooth, and the angle of descent was steep, but by no means as steep as the drop of the vertical geyser shaft in which he now hung.

Laughter, music, the new tunnel suddenly aroused an excitement which made him quiver.

“When I saw *her*,” he gasped, “she was standing here, in the mouth of this tunnel, looking up at me!”

Violently, Freddie Kirby forgot the maple-shaded street of his Kansas town, forgot everything but desire to reach the mouth of the new tunnel, where the girl of the exquisite face and beckoning lips had

stood. Tightening his grip on the rope, he began to swing himself back and forth like a pendulum.

It seemed probable that when the geyser water shot up past the horizontal tunnel, its force was so great that no water at all entered. He redoubled his efforts to widen his swing.

Then his feet scraped on the floor, and in a second he had alighted there. He still hung stoutly to his line, however, for the tunnel sloped down sharply enough, and was slippery enough, to prohibit the maintenance of footing unaided.

The music which issued from the depths of that stunningly mysterious passage swelled to a crescendo—and stopped. Kirby clung there to his precarious perch, his feet slipping on the glass under them with every move he made, and feelings stirred in his heart which had never been there before.

Then, as silence reigned where the music had been, something prompted him to look up. The next instant he stifled a cry.

With widening eyes he saw the flash of a white arm and the gleam of a knife hovering over the spot where his taut rope passed out of the geyser opening into the sunshine of the outer world. Again he stifled a cry. For crying out would do no good. While the suppressed sound was still on his lips, the knife flickered.

Then Kirby was shooting downward, the severed line whipping out after him. The first plunge flung him off his feet. A long swoop which he took on his back dizzied him. But as the fall continued, he was able to slow it a little by bracing arms and legs against the tunnel walls.

“Holy Jeehosophat!” he gurgled.

But there seemed to be no particular danger. The slide was as smooth as most of the chutes he had ever encountered at summer swimming pools. If ever the confounded spiral passage came to an end, he might find that he was still all right. As seconds passed and he fell and fell, it seemed that he was bound for the center of the earth. It seemed that—

He swished around a multiple bend, and eyes which had been accustomed to darkness were blinded by light.

It was light which radiated in all colors—blue, yellow, browns, purples, reds, pinks, and then all the new colors for which he had no name. Somehow Kirby knew that he had shot out of the tunnel, which emerged high up in the face of a cliff, and that he was dropping through perfumed, brilliant air resonant with the sound of birds and insects and human cries. The funny thing was that the pull of gravity was not right, somehow, and he was dropping fairly slowly. From far below, a body of what looked like water was sweeping up to meet him. Kirby closed his eyes.

When he opened them again, his whole body was stinging with the slap of his impact, and he found that it was water which he had struck. The proof of it lay in the fact that he was swimming, and was approaching a shore.

But such water! It was milky white and perfumed as the geyser flow had been, and it seemed luminous as

with a radium fire. Had he not realized presently that the fluid probably contained enough arsenic to finish a thousand like him, he would have thought of himself as bathing in the waters of Paradise.

But then he began to forget about the poison which might already be at work upon him.

Ahead of him, stretched out in the gorgeous, colored light, ran a beach which was backed by heavy jungle. And on the beach stood the lovely creatures, all clad in shimmering, glistening garments, whose flutelike cries had come to him as he fell.

Kirby looked, and became almost powerless to continue his swim. The beauty of those frail women was like the reputed beauty of bright angels. That paralyzing effect of wonder, however, did not last long.

The girls moved forward to the water's edge, and, laughing amongst themselves, beckoned to him with lovely slender hands whose every motion was a caress.

“Be not afraid,” called one in a curious patois dialect, about five-sixths of which seemed made up of Spanish words, distorted but recognizable.

“The water would kill you,” called another, “as it killed the Spaniard in armor. But we are here to save you. I will give you a draught to drink which will defeat the poison. Come on to us!”

Kirby’s heart was almost literally in his mouth now, because the girl who promised him salvation was she whose lips had formed a kiss at him from the green-gloomy throat of the geyser.

His feet struck a shale bottom. Panting, he stood up and was conscious of the fact that despite his forlornly dripping and dishevelled condition, he was tall and straight and big, and that for some reason all of the girls on the gleaming sand, and one girl in particular, were anxious to receive him here.

The one girl had drawn a small, gleaming flask of gold from the misty bodice of her gown, and was holding it out while she laughed with red lips and great,

dazzling dark eyes.

“Pronto!” she called in pure Spanish, and other girls echoed the word. “Oh,” went on the bright owner of the flask, “we thought you would *never* have done with your work on the rope. It took you so long!”

Kirby left the smooth lake behind him and stood dripping on the sand. The moment the air touched his clothes, he felt that they were stiffening slightly. Yet the sensation brought no terror. He could not feel terror as he faced the girls.

“Give him the flask, Naida!” someone exclaimed.

“Ah, but the Gods *have* been kind to us!” echoed another.

The girl with the flask made a gesture for silence.

“Is it Naida you are called?” Kirby put in quickly, and as he spoke the Spanish words, the roll of them on his

tongue did much to make him know that he was sane and awake, and not dreaming, that this was still the Twentieth Century, and that he was Freddie Kirby.

Answering his question, Naida nodded, and gave him the flask.

“A single draught will act as antidote to the poison,” she said.

“I drink,” said Kirby as he raised the flask, “to the many of you who have been so gracious as to save me!”

A flashing smile, a blush was his answer. And then he had wetted his lips with, and was swallowing, a limpid liquid which tasted of some drug.

“Enough!” Naida ordered in a second.

As she reached for the flask, her companions closed in as though a ceremony of some sort had been completed.

“Is it time to tell him yet, Naida?” piped one of the girls, younger than the rest, whom someone had called Elana.

“Oh, *do* begin, Naida,” chorused two more. “We can’t wait *much* longer to find out if he is going to help us!”

Kirby turned to Naida, while a soothing sensation crept through him from the draught he had taken.

“Pray tell me what it is that I am to be permitted to do for you. I can promise you that the whole of my life and strength, and such intelligence as I possess, is yours to command.”

Excited small cries and a clapping of hands answered him. As for Naida, her face lighted with glowing joy.

“Oh, one who could say that, *must* be the friend and protector of whom we have stood in such bitter need!”

“What,” asked Kirby, “is this need which made one of you cut my rope, so that I should come here?”

A momentary silence was broken only by the hum of insects in the perfumed air, and by the golden thrilling of a bird back in the jungle. Then Kirby beheld Naida bowing to him.

“So be it,” she said in a voice low and flutelike. “I will speak now since you request it. Already you have seen that you are here in our world because we conspired amongst ourselves to bring you here. Our reason—”

She paused, looked deep into his eyes.

“Amigo,” she continued slowly, “we whom you see here are the People of the Temple. For more centuries than even our sages can tell, our progenitors have dwelt here, where you find us, knowing always of your outer world, but remaining always unknown by it. But now the time has come when those of us who are left amongst our race need the help of one from the outer races we have shunned. Dangers of various

orders confront us who have waited here for your coming. When we first discovered you in the Valley of the Geyser, the idea came to me that we must make you understand our troubles, and ask of you—”

But then she stopped.

As Kirby stared at her, the gentleness of her expression was replaced by a swift strength which made her majestic.

The next moment bedlam reigned upon the beach.

“They are after us!” gasped one of the girls in terror.
“Quick, Naida! Quick! Quick!”

Whatever it was that threatened, Naida did not need to be told that the need for action was pressing. She shouted at her companions some order which Kirby did not understand. From a pouch at her side, she snatched out a greyish, spherical vegetable substance which looked almost like a tennis ball. Then she braced herself as if to withstand an assault.

“Stand back!” she cried to Kirby.

He had long ago ceased to wonder at anything that might happen here. Disappointed that Naida’s story had been interrupted, wondering what was wrong, he obeyed Naida’s order to keep clear.

As he fell back and stood motionless, there came from behind a dense screen of shrubs which would have resembled aloe and prickly pear bushes, save that they were as big as oak trees, a ghastly howling. The next second, hopped and hurtled across the beach toward the girls, a group of hair-covered, shaggy creatures which were neither apes nor men. The faces, contorted with lust, were hideously leathery and brown, the foreheads small and beetling, and the mouths enormous, with immense yellow teeth.

Helpless, Kirby realized that Naida and all the others had clapped over their faces curious masks which seemed to be made of some crystalline substance, and that now others had armed themselves with the tennis balls. And that was the last observation he made before the battle opened furiously.

With a cry muffled behind her mask, Naida leaped out in front of her squadron and cut loose her queer vegetable ball with whizzing aim and force.

Full into the snarling face of one of the ape-men the thing smashed, filling the air all about the creature with a yellow, mistlike powder. Kirby was half deafened by the yells of rage and terror which went up from the entire attacking band. The creature who had been hit fell to his knees the while he made agonized tearing movements at his face and uttered shrill, jabbering yelps.

Other balls flashed instantly from Naida's ranks, and each brought about the same ghastly result as the first. But then Kirby saw that the whole jungle seethed with the hairy, awful men.

"Keep back!" Naida shrieked at him through her mask. "We have no mask for you. If the powder from our fungi touches you, it will be the end!"

With gaps in the advancing line filled as soon as each screeching ape went down, the attackers leaped on

until Kirby knew they would be upon the girls in a matter of seconds. A sweat broke out on his neck.

But then an idea gripped him, and suddenly, without even a last glance at Naida, he leaped away even as she had commanded.

A great boulder lay on the shore fifty yards away. Toward it Kirby streaked as though he had become coward. But he had not turned coward.

By the time he reached the shelter which would protect him from the fungus mist, a turning point had come in the battle. The ape-men had closed in on the girls, were swarming about them, and the mist balls had almost ceased to fly. But the thing which gave Kirby hope was that the apes were not attempting to harm the girls. They seemed victors, but they were not committing atrocities.

It was the sharp intuition that something like this might happen which had sent Kirby fleeing from the fight. He believed he might yet prove useful.

The thickest group of attackers were jostling about Naida. As the screams and sobs of the girls quivered out, mingled with the guttural roaring of the men, Naida was shut off by a solid wall of aggressors.

Then Kirby saw her again. But now two of the most powerful of the ape-men had caught her up and was carrying her. Her kicking and writhing and biting accomplished nothing. The apes were headed directly back to the jungle.

Now, however, most of the yellow mist had disappeared, and that was all Kirby had been waiting for. With a growling shout, he tore out from behind his boulder, his Luger ready. Naida's captors were in full retreat, and other pairs of men were snatching up other girls and hopping after them. Toward Naida Kirby ran madly but not blindly.

"Naida! Naida!" he bellowed.

He got in two strides for every one the apes made.

"Naida!" he shouted, and at last saw her look at him.

Her face was pallid with loathing and terror. As her glimmering dark eyes met his, they flashed a plea which made his heart thrash against his lungs.

With a final roar of encouragement Kirby closed in on the hair-covered men, and fired instantly a shot which caught one full in the heart. The creature wavered on its legs, looked at the unexpected enemy with dismayed, swinish little red eyes, and relaxing his hold upon Naida, dropped without making a sound.

After that—

But suddenly Kirby found himself unable to comprehend fully the other terrific results of his intervention. Before the echoes of his shot died, there came to him the rumble of what seemed to be tons of falling rock. In the bright air a slight mist was precipitated. To all of which was added the effect upon the ape-men of fear of a weapon and a type of fighter utterly new to them.

Kirby had fired believing that he would have to fight other ape-men when the first fell. But not so. Instead

of that—

He blinked rapidly as he took in the scene.

Naida had been released. Lying on the sand beside the dead ape-man, she was looking up at him in stupefied wonder. And her other captor, instead of remaining to fight, had clapped shaggy hands over his ears, and was leaping headlong for the protection of the jungle!

Moreover, the soprano cries of the girls and the deep howls of the men were rising everywhere, and everywhere the ape-men were dropping their captives and plunging away after their leader.

“Huh,” Kirby muttered aloud, and wondered what the citizens of Kansas would have to say about *this*.

Naida looked at the dead and bleeding ape-man and shuddered, and then at the score or so of others brought down by the puff balls. Then she looked up at Kirby, raised her arms for his support, and smiled up into his brown face.

Kirby forgot Kansas, lifted her, warm and alive, radiantly beautiful, in his arms.

“Our friends the enemies,” she whispered as she remained for a second in his embrace and then drew away, “will attack no more this day—thanks to you.”

There was no possible need for another shot, Kirby saw. In terrified silence, the first of the apes had already floundered behind the prickly pear and aloe bushes, and the last stragglers were using all the power in their legs to catch up. On the beach, Naida’s followers were picking themselves up, and already a few of them had burst into ringing laughter.

“Come on, all of you,” Naida said to them, and, including Kirby in her glance, added, “We may as well go to the caciques now, and have it over with.”

Chapter 4

It was with Naida at his side and the other girls grouped about them, that they started their journey to the “caciques,” whoever they might be, “to have it over with,” whatever that might mean. As they strode along in silence, Kirby did what he could to straighten out in his mind the many curious things which had happened since he sat testing his rope in the upper world this morning.

In final analysis, it seemed to him that, extraordinary as his experience had been, there was nothing so much out of the way about it, after all. The only unusual thing was the existence of this inhabited pocket in the earth. For the rest, the strange colors to which he could not put a name, were simply some manifestation of infra-reds and ultra-violets. And then the startling effect of his single shot at the ape-men—that was simply the old story of savage creatures running from a new weapon and a new enemy; naturally the shot had sounded loud in this enclosed cavern. Lastly, the pull of gravity down here seemed upset somehow. But why should it not seem so, at this

distance within the earth? The American was no scientist; the conclusions he reached seemed very reasonable to him.

All told, the last thing Kirby found he needed to do was pinch himself to see if he was awake.

A place of indefinite extent, the cavern seemed to be exactly what he had already judged it—a giant pocket within the earth. The ceiling, or the sky, was of some kind of natural glass—no doubt the same kind which was crackling on his clothes now—and from it emanated the brilliant, many colored glow which lighted the cavern. Radium? Perhaps it was that. Perhaps the rays were cast off from some other element even less understood than mysterious radium. As for the plant and animal life with which the cavern teemed, it was amazing.

But Kirby did not give himself up to silent observation any longer.

“Will you finish telling me,” he asked of Naida, “about the task I am to perform for you here?”

Naida, walking with lithe strides along a path jungle-hemmed on both sides, smiled at him.

“You are to be our leader.”

“Yes?”

Now both Naida and the other girls became sober.

“You will lead us in a revolt.”

“Ah!” Kirby whistled softly.

“In a revolt against the caciques—the wise men—whose kind have governed the People of the Temple since the beginning.”

Her statement was received with acclaim by the whole troop, who crowded close around, the while they smiled at Kirby.

“You mean I am to lead a revolt,” he asked, “against these same caciques whom we are going now to face?”

Naida nodded emphatically.

“Yes, if revolt proves necessary. And it probably will.”

“Hum.” Kirby scratched behind his ear. “You’d better tell me what you can about it.”

Then, as they hurried on, Naida spoke rapidly.

The situation before the People of the Temple was that for a long time now, the only children to be born had been girls. Worse still, not even a girl had been born during a period equal to sixteen upper-world years. The only remaining members of a race which had flourished in this underground land for countless thousands of years, consisted of the caciques, a handful of aged people, and the thirty-four girls, including Naida, who accompanied Kirby now.

On one hand was promised extinction through lack of reproduction. On the other, even swifter and more terrible extinction at the hands of the ape-men, whom Naida called the Worshippers of Xlotli, the Rabbit God, the God of all bestiality and drunkenness.

It was the menace of the ape-men, rather than the less appalling one of lack of reproduction, which was making the most trouble now. Ages ago, when the People of the Temple had flourished as a race, they had been untroubled by the Worshipers of Xlotli. But now the ape-men were by far the stronger; and they desired the girls who had been born as the last generation of an ancient race. The battle of this morning had been only one of many.

Dissension between the caciques, who ruled the People of the Temple, and their girl subjects, had arisen on the subject of the best way of dealing with the ape-man menace.

Some time ago, Naida, heading a council of all the girls, had proposed to the caciques that support be sought amongst the people of the upper world. This would be done judiciously, by bringing to the lower realm a few men who were wise and strong, men who would make good husbands, and who could fight the ape-men.

This proposal the priests had promptly quashed. They

would never receive, they said, any members of the teeming outer races from whom the People of the Temple had so long been hidden. Those few who had blundered into the Valley of the Geyser during the centuries, and who had never escaped, were enough. Better, said the caciques, that a compromise be arranged with the subjects of the Rabbit God.

Flatly then, the priests had proposed that some of the girls, the number to be specified later, should be given to the ape-men, and peace won. During the time of reprieve which would thus be afforded, prayers and sacrifices could be offered the Lords of the Sun and Moon, and to Quetzalcoatl, the Feathered Serpent. In answer to these prayers, the Gods would surely send the aged people who alone were left as prospective parents, a generation of sons.

Once the priests' program of giving up some of the girls to the ape-men had been made definite, it had not taken Naida and the others long to decide that they would never submit. And then, while matters were at an acute stage, a tall, blond white man had come to the Valley of the Geyser—Kirby.

As Naida had finished her story, Kirby mustered a smile despite the soberness which had come upon him.

“So the white man came,” he repeated after her, “and all of you decided forthwith to stage your revolt.”

“Why not?” Naida answered. “We observed you until we were sure you possessed the qualities of leadership we wanted. After that, we did what we could to coax you to come here.”

Kirby grinned at that.

“Now,” Naida ended simply, “we will go to the caciques. If they accept you, and grant our requests to them, there will be peace. If they rage, it will be war.”

Suddenly she drew closer to Kirby as they swung along, and slipped her hand into his, looking up at him in silent entreaty.

“How much farther,” he asked in a voice which

became sharp, “until we reach the headquarters of these caciques?”

“They live in a castle which our ancestors built ages ago on a protected plateau,” Naida answered tensely. “It is a good distance still, but we will cover it soon enough.”

They crossed now one edge of a shadow-filled forest composed principally of immense, pallid palmlike trees. Farther on, the path wound through a belt of swampy land covered by gigantic reeds which rustled above their heads with a glassy sound, and by things which looked like the cat-tails of the upper world, but were a hundred times larger. Everywhere hovered odd little creatures like birds, but with teeth in their long snouts and small frondlike growths on each side of their tails. About some swamp plants with very large blooms resembling passion flowers, flitted dragon flies of jeweled hues and enormous size, and under the flowers hopped strange toadlike creatures equipped with two pair of gauzy wings.

Finally, through a tunnel composed of ferns a hundred

feet high, they emerged to a still densely overgrown but higher country which Naida said was a part of the Rorroh forest.

In the forest, Kirby gained a hazy impression of bronzy, immense cycads and what appeared to be tree chrysophilums with gorgeous blossoms. Then he received a much clearer impression of other trees with blossoms of bright orange yellow and very thick petals, each tipped with a glassy sharp point. The disconcerting thing about the tree was that, as they approached, the scaly limbs began to tremble and wave, and suddenly lashed out as though making a human effort to snatch at the bright travelers.

Naida and all the others hurried along without offering comment, and Kirby asked no questions.

Once he thought he saw a group of gorilla creatures paralleling their course back amongst the forest growth, but if Naida observed the animals, she paid no attention. The one thing which had any effect upon the company was the appearance, presently, of two vast, birdlike creatures. As these things approached,

Naida signaled to all to crouch beneath the shelter of a tall rock beside the path.

Enormous, the birds had bat wings, and carried with them, as they approached, the stink of putrid flesh. The long beaks were overfull of sharp teeth. The heads, set upon bodies of glistening white-grey, were black. Reddish grey eyes searched the jungle as the creatures flapped along. But, the Pterodactyls—if they were that—passed above Naida's band without offering attack, and presently Naida gave the command to advance again.

In time, they came to a chasmlike gorge across which was suspended a slender long thread of a bridge. Not far above the bridge, a considerable river emptied itself into the gorge in a mirrorlike ribbon. Kirby could not hear the torrent fall—or rather could not hear it strike any solid bottom. But from somewhere in the unlighted, unfathomed depths of the abyss rose strange bubbling and whistling sounds.

At the bridge, Naida paused and pointed to the land across the river. And as Kirby looked in the direction

indicated, he beheld a rocky eminence rising for several hundred feet straight up from the expanse of a level, tree and grass covered plain. Atop of the plateau, glimmered the complex towers and turrets, the crenellated walls of a castle which, in its grey antiquity, seemed as old as the race of men.

“It is behind those walls that the caciques dwell,” Naida said quickly. “It is behind the castle, in a series of separate houses, that the older members of the race dwell. We shall go and look upon them presently. But first we will force an interview with the caciques.”

In silence Kirby took her hand, and, with the others following, they moved out upon the swaying, perilous causeway which hung above the chasm. After that, the trip across the plain to the foot of the plateau cliffs was quickly accomplished.

Here, however, Kirby thought they must face trouble, for he found that the great walls, of a sparkling, almost glassy smoothness, shot up to a height of at least three hundred feet, and that no path of any sort was visible.

“We’re here,” he said, “but how can we get up?”

But understanding began to dawn as Naida laughed, and produced from the pouch at the side of her gauzy dress four pliable discs of a substance which resembled rubber.

“You are very strong, are you not?” she asked.

“Yes.”

“Then you will have no trouble in following us up the cliff. Our Serpent God, Quetzalcoatl, taught us how to climb long ago.”

With that she handed Kirby the set of vacuum discs, and producing another for herself, moistened them in a pool of water close at hand. Then, as all of the girls followed her action, she strapped them to her hands and feet, and in a moment they had begun the ascent.

“Why,” Kirby said presently, “with these things you could hang by your feet and walk on a smooth ceiling!”

Naida laughed, and they worked their way upward.

When the climb was accomplished and the discs were put away, Kirby found himself standing on the outer edge of a mediaeval paradise, of a magnificent plateau partly fortified by nature, partly by the hand of man.

“Ah!” he cried in deep admiration, then followed Naida.

The building—the castle—in the near distance, resembled a castle of Spain, save that there was greater beauty and subtlety of architecture. Turreted on all four corners, constructed of material which looked like blocks of natural glass, the fairylike structure was crowned by a gigantic tower of something which resembled obsidian. Up and up this tower soared until its gleaming black tip seemed almost to touch the glassy-radiant sky of the cavern.

No people showed themselves, and Kirby saw that the bronze-studded portals set in the front of the castle were closed.

Admiringly, he glanced at the surrounding land laid out in checkerboard patches of gardens and orchards where grew a bewildering variety of unknown fruits and blooms. Butterflies drifted past, and the air was freighted with the scent of flowers. Inside a walled enclosure, Kirby saw a good-sized plot heavily grown with the plant on which he had been subsisting. As they passed this ground, each of the girls, Naida leading, made a strange little bowing, gliding genuflection, and Kirby wondered.

Now, however, new sights distracted him as they crossed a port drawbridge above a deep moat which was a fairyland of aquatic plants. Although not a sound had come from the castle, the great entrance doors were swinging back.

“Be ready,” Naida whispered, “for almost anything. The doors are being opened by some of the palace guard. I have little doubt that word was long ago rushed to the caciques that we are come to them with an upper-world man!”

Kirby answered with a nod. Then they passed the

outer doors, passed inside, and Kirby blinked at what he saw.

In a long hall decorated bewilderingly with a carven frieze in which appeared all of the symbols common to early Mexican religions, and many new ones, stood a row of bright suits of armor of the Sixteenth Century. From each suit peered the glassy face and shovel beard of a dead Conquistadore.

So this was what happened to intruders from the upper world! The Conquistadore who kept his long watch beside the geyser was not the only one! Kirby felt an involuntary chill prickle up his back. But he was not given long to think before Naida, ignoring the gruesome array, clasped his arm.

“Look! Behold!”

And Kirby saw that with almost magical silence the whole wall at the end of the corridor was sliding back to reveal an enormous amphitheatre in the center of which stood a vast circular table. Ranged in a semicircle about that table, stood fifteen incredibly

ancient men clad in long, glistening grey robes. Blanched beards trailed down the front of the garments until they all but touched the floor.

The caciques!

Kirby, on the threshold of the amphitheatre, squared his shoulders and held his head high. Then with Naida on his right, his own eyes boring unyieldingly into the smouldering, narrowed eyes which stared at him, he advanced.

But in front of him the priests moved suddenly. From Naida burst a shriek. In the radiant glare of the council room flashed the long, thin, cruel blade of a sacrificial knife.

The cacique who had whipped it from his robe flew at Kirby with a condor swoop, talon-hands outstretched, his wrinkled, bearded face contorted with fury.

Chapter 5

Before Kirby was more than half set to fight, the priest was clawing at his throat, and a gnarled old fist was poised to drive the knife in a death stroke.

Kirby did the only thing he could do quickly—sprang to one side. The move saved him. The knife whipped past his shoulder, and the cacique nearly fell. But it had been a close enough squeak for all that.

Nor was it over. After Kirby the priest sprang with unexpected agility, and before Kirby could snatch at his pistol the talon-hands were lunging at his throat once more.

With the gasps of the girls ringing in his ears, Kirby bunched himself for another side leap only to find the cacique all over him like an octopus. Momentarily the knife hung above his chest, and Kirby, dismayed at the powers of his opponent, almost felt that the thing must plunge before he could break the octopus hold.

But he had no intention of being defeated, and now he

was getting used to the fight. The priest's left arm swiftly clenched about his neck and shoulders, and the right arm, with the knife, attempted a drive through to the heart. Suddenly, however, Kirby lurched sideways and backward, and as the octopus grip slackened for a flash, he himself got a wrestler's grip that left him ready to do business. As the priest broke free, he slid around in an attempt to fasten himself on Kirby's back. Quickly, tensely Kirby doubled, and knew that he had done enough. The cacique shot over his shoulders, described a somersault in midair, and landed with a sharp crack of head and shoulders against unyielding stone.

From the semicircle of other priests went up a gasp. From Naida came a strangled cry of joy. Kirby made one leap for the knife which had fallen from the cacique's hand as he slumped into unconsciousness, and then he straightened up with the weapon safe in his possession.

"There, you old billygoat," he croaked in English, "maybe you won't try any more fast ones for awhile."

A second later he stepped over the sprawled body to stand beside Naida.

Upon the wrinkled countenances of the remaining caciques was stamped a look of dismay and hatred which boded no good. It was plain to Kirby that in battering up the man detailed to kill him, he had committed a desecration of first order.

“Is there anyone else who cares to fight?” he flung at them in Spanish, showing a contempt as great as their rage.

The response he got was instant. From one old gullet, then from others, came choking, snarling sounds which presently became words. By those words Kirby heard himself cursed with a vituperation which made him, even in his temporary triumph, feel grave.

But he did not let that soberness trouble him long. For the main point now was that no one made a move to fight further, which was what he had expected. He had flung them the challenge, knowing that he was possessed of their knife, and suspecting that it was

their only weapon. The belief that no one would care to try a barehanded conflict, no matter what insult was waiting to be avenged, seemed justified as none of the caciques advanced, and as even the cursing presently ceased.

“No?” Kirby asked. “There is to be no more fighting?”

One of the caciques now came forward a few steps.

“No,” he answered with a lameness which was not to be denied. “But you, a criminal interloper in our realm, have been marked as a victim for sacrifice, and from this there is no power in the universe which can save you.”

Kirby, after a reassuring glance at Naida, looked at the floored priest who was sitting up now, looking stupidly about, and feeling himself all over, and Kirby suppressed a grin.

“Ah, I am to be sacrificed, eh? But what happens until

that time comes? Listen my Wise Ones—”

He stabbed a finger at them, and his eyes flashed.

“Listen! What you mean to say is that I have defeated you, and you must lay off me until you can launch another attack. But I have a few things to say to that. One is that I am not going to permit myself to *be* sacrificed. Another is that I demand, right here and now, that you begin to discuss with me certain agreements which are going to regulate the future conduct of affairs in this world to which I have come.”

A low exclamation answered that, but it came from no priest. They remained sullen and staggered. It was Naida who murmured, and there was excitement and pleasure in her voice. Suddenly she placed her lips against Kirby’s ear.

“You must not treat with them,” she said. “Tell them you want to see the Duca, and will destroy them all unless he comes!”

Understanding burst over Kirby. The Duca! Then

these men were only the representatives of a High Priest, the Duca!

“Yes,” he repeated resolutely to the assembled greybeards, “a meeting is going to be held in this chamber of council at once. But I will not deal with you! Do you understand me? I must see the Duca. I leave it to you to decide whether you will summon him, or force me to fight my way through to wherever he is staying.”

“The Duca!”

The words burst in dismay from the gimlet-eyed cacique who had said there would be no more fighting. He looked at Naida, well aware of the fact that it was her interference which had made Kirby extend his demand. And his look was black.

Kirby slid between Naida and the cacique.

“Yes,” he spat out, “the Duca! Will you summon him, or—”

He did not repeat what he would do as an alternative. A second passed in silence. It seemed as if the cacique who had been speaking was ready to burst.

“Answer me!” Kirby thundered.

And then the priest obeyed.

“Very well,” he growled in a voice which quaked with rage. “I obey. But you will wish you had never made the demand!”

The next second he swung on his heel, and leaving his company behind as a guard, headed toward a stair which led upward from one side of the amphitheatre, and which was protected by a door of heavy, grilled metal work. The stairway seemed to be spiral, and was all enclosed. Kirby realized that it must lead into the tall and beautiful tower of obsidian which he had seen outside.

“Oh,” Naida whispered as looks and smiles of approval came from all of the girls, “you have been magnificent! Mark now, what we must do. You must

be the one to state our terms, because you have already won a victory for us. Tell the Duca that we will not submit to any compromise with the ape-men, and least of all will we let any of our number go to the ape-men."

A deep flush crept into Kirby's cheeks at thought of what he would like to do to the man who had proposed that sacrifice.

"Then tell him," Naida continued, "that we want men brought to our world from the world above. And finally tell him we will live under his dictatorship no longer, and hereafter demand a voice in all councils affecting temporal affairs."

"All right," Kirby spoke grimly. "I'll tell him. Naida, is this high priest we're waiting for, the one who proposed sacrifice of some of you to the apes?"

Naida nodded.

Next moment, she, Kirby, and all the others, including the row of glowering caciques, became silent. At

sounds from above, all looked toward the grilled doorway to the tower. Then Kirby realized that all of the girls, as well as the caciques, were dropping to their knees.

“No!” he commanded quickly. “Get up! You must not abase—”

He had not finished, and Naida had scarcely risen, when the heavy door swung on noiseless hinges.

The light in the amphitheatre seemed to become more intense. Then, against the great glow, Kirby beheld majesty, beheld one who represented the apotheosis of priestly rank and power.

Clad in robes of filmy material which glimmered white beside the gray robes of his underlings, the Duca wore about his waist the living flame of a girdle composed of alternate cut diamonds and blood red rubies each larger than a golf ball. And Kirby, searching for comparisons, realized that the Duca’s face, upheld to others, would be as remarkable as his jewels must be when compared to ordinary gems. It

was a chiseled face, seamed by a thousand wrinkles, which a god might have carved from ivory before endowing it with the flush and glow of life. A mane of snow white hair cascaded back from a tremendous forehead to fall about thin but square shoulders and mingle with the downward sweep of pure white beard. The eyes, black as polished jet, flamed now with the glare of baleful fires.

As Naida, stealing close to Kirby, trembled, and even the abased caciques trembled, Kirby himself felt as if icy water was trickling over him.

He fought the sensation off. For suddenly he knew that in spite of first impressions which made the man seem a living god, the old Duca was human. And what was more, he was in the wrong. All of which being true, the thing to do was keep a level head and fight.

All at once Kirby spoke across the silence in the great room.

“I have sent for you,” he said, weighing words carefully.

“And I,”—the Duca’s voice was mellow and deep —“have come. But I am not here because you summoned me.”

“Oh!” Kirby let sarcasm edge his words. “Well, I won’t quibble about your motives for coming. Did my messenger tell you why we are here and demand your presence?”

“Your messenger,” the old man said calmly, “told me.”

“Very well. Do you consent to listen to Naida’s and my terms? If you *will* listen—”

“But wait a moment,” the Duca interrupted, still calmly, but with a look in his eyes which Kirby did not like. “Are you asking *me*, to my face, whether I will listen to terms which you offer as self-styled victor of a battle with my caciques?”

Kirby nodded. His apprehension increased.

“Ah,” said the Duca softly. And then, amazingly, a smile deepened every wrinkle of his parchment face.

“But do you not remember that I said I had *not* come here because you summoned me?”

“Yes,” Kirby said solidly. “I remember very well.”

“The thing which brought me here was the failure of my followers to accomplish an assignment which I had given them—namely, that of ending your life.”

“Hum.” Kirby scratched behind his ear. “You are *not* interested in arranging terms of peace, then.”

“I am here,”—suddenly the Duca’s voice filled the room—“to do that which my priests were unable to do. And the moment has come when the Gods will no longer trifle with you. You dog! You thieving intruder! You—”

Swiftly the Duca plunged one withered but still powerful hand into the folds of his robe above the flaming girdle. Then his hand flashed out, and in it he held—

But Kirby did not get to see.

A strangled cry of terror smote his ears. Naida leaped toward him from one side, while Elana, the lovely youngest girl, sprang from another direction, hurled Naida aside, and stopped in front of Kirby.

Through the glaring room flickered a tiny red serpentine creature which the Duca hurled from a crystalline tube in his hand. As the minute snake struck Elana's breast, she gave a choked cough, and then, as she half turned to smile at both Naida and Kirby over her shoulder, her eyes went blank, and she collapsed gently to the polished stones of the floor—dead.

A second later came squirming out from under her the ghastly, glimmering little snake which had struck.

Slowly, while every mortal in the room stood paralyzed, Kirby stepped forward and set his heel upon the writhing thing. When he raised his boot, the snake was only a blotch on the floor.

The Duca was standing as still as girls and caciques. The laughter with which he had started to greet what he had thought would be Kirby's extermination had faded to a look of wonder—and fear. He was an easy mark.

Up to him Kirby rolled, and with all the force of soul and muscular body, drove his fist into the Duca's face.

"By God," he roared, "you want war, and you shall have it!"

The Duca was simply out—not dead. Since Kirby did not want him dead, he did not strike again, but swung back from the sprawled body, faced Naida, and pointed to the tower door.

"Up there!" he snapped. "Seize the tower. I have a reason!"

At the Duca's crashing downfall, had come to the caciques a tension which made Kirby know they would not be dummy figures much longer. His eyes never left them.

“Quick, Naida!” he snapped again. “We must hold the tower!”

Naida, all of the girls, were staring dazedly at Elana, dead.

“The tower!” she choked. “But we cannot go there. It is the Duca’s!”

“Because it is the Duca’s,” Kirby said firmly, “is exactly why we must hold it. Come, Naida, please—”

And then he saw comprehension begin to dawn at last.

He also saw two of the caciques glide from the wooden line, and slink toward him past the unconscious Duca, stealthily.

As Naida suddenly cried out to her companions, pushed at two of them, and then darted like a rainbow nymph toward the silent and forbidding upward spiral

of steps, Kirby faced the gliding caciques.

One he clutched with viselike hands, and lifted him. As the other shrieked and sprang, he was mowed down by the hurtling body of his fellow priest which Kirby flung forward mightily.

The rest of the caciques were howling. While Naida waited beside the tower door, the other girls flashed up the steps. The Duca still lay where he had fallen, a thread of blood oozing from his mouth. Kirby, after his last look over all, solemnly stooped and gathered in his arms the limp, radiant little body of the girl who had given her life that her friends might be left with a leader.

A moment later, he was standing on the steps. Naida, unopposed by the still stupefied caciques, swung shut the tower door and shot a double bolt.

“Naida—” Kirby whispered as he held Elana closer to him, “oh, I am so sorry that we could have won only at such a price.”

As Naida stooped to kiss the pale little forehead with its halo of golden hair, sobs came. But then she raised her eyes, and they were, for Kirby, alight with the message that she could and would accept Elana's sacrifice, because she would gladly have made it herself.

"We will not forget," she whispered. "Carry her tenderly, and come."

For better, for worse, the Duca's tower was theirs.

Chapter 6

At the end of an hour, Kirby was taking a turn of guard duty at the foot of the steps, while the others remained with Elana in a chamber above. To Kirby, with things thus far along, it seemed that the seizure of the tower had proved a shrewd stroke.

It seemed that the tower was to the Duca what hair was to Sampson. From Naida had come the information that the Duca lived hidden within the great shaft of obsidion, and appeared but seldom even before his caciques. Apparently a large part of his hold upon his subjects was maintained by the mystery with which he kept himself surrounded. And now his retreat was lost to him! Such had been the moral effect of the loss upon both Duca and caciques, that his whole first hour had gone by without their doing anything.

Kirby, standing just around the first turn of the winding stairway, presently cocked his ears to listen to the conclave being held in the amphitheatre.

“Why not starve them out, O Holy One?” he heard one of the caciques ask of the Duca, only to be answered by a growl of negation.

The Duca, Kirby had gathered before this, wanted to fight.

“But there is no food in the tower, is there?” the cacique still pressed on, and this time he was supported by other voices.

“No,” the Duca rumbled back. “But am I to be deprived of my retreat, left here like a common dog amongst other dogs, while these accursed fiends starve slowly to death? No! I tell you, you must fight for me!”

But he had told them so several times before and nothing had happened. Kirby grinned at the thought of the caste the Duca was losing by being driven to this belittling parley.

“Holy One,” exclaimed a new priest in answer to the urge to fight, “what can we do against the golden

haired fiend? The stairs are so narrow that he could defend them alone. And then there are the gates of bronze. If we could shatter the first, at the foot of the steps, we should only encounter others. The Duca must remember that his tower was built to withstand attack.”

“Even so,” the Duca snapped back, “it must be attacked! I—”

But then he fell silent, having been made so by the sounds of dissension which arose amongst his caciques. Kirby, laughing to himself, turned away from his listening post, and tip-toed up the steps.

After he had closed and bolted behind him three of the bronze portals so feared by the caciques, he turned to the entrance of the chamber in which he had left Naida and the others. Here all was silent, and he found his friends grouped about a couch on which lay Elana. Feeling the solemnity of the moment, he would have taken his place quietly amongst the mourners.

Naida, however, came to him at once, and in a low voice asked for news from the amphitheatre, and when Kirby answered that the caciques were unanimously in favor of leaving them alone until they starved, she exclaimed:

“Oh, then it is good news!”

After that, however, a shadow of doubt flickered in her great eyes.

“And yet, is it? It means temporary immunity, of course. But—starvation!”

Kirby assured her with a grin.

“If we had to starve we might worry. But there is more food here than the Duca thinks. Look!”

From a bulging pocket of his tunic he fished a strip of the roots on which he had subsisted so comfortably. Naida’s eyes widened, and several of the girls gave low cries.

“Yes,” Naida exclaimed, “but such food! Why—why, do you know what you are offering us? Why, this is the sacred Peyote! Only the Duca eats it, and, at rare intervals, his priests.”

Kirby was really startled now.

“But surely you and the others have taken quantities of the stuff away from the Valley of the Geyser. Do you mean—”

“Because we gathered the Peyote does not mean that we have ever tasted it. We gather it for the Duca. To taste would be complete, utter sacrilege. Have *you* been eating it?”

Inwardly Kirby was chuckling at this added proof of the buncumbe with which the Duca—and other Ducas—had fooled all.

“Of course I’ve been eating the Peyote.”

“And—and nothing has happened to you?” Naida asked.

“Hardly. I certainly haven’t been blasted by the Lords of the Sun and Moon, or the Serpent either!”

Naida and all the others were silent. The conflict between their reverence for the food and their clear desire to eat it, now that it was become the food of their leader, was pathetic.

Kirby put one of the strips in Naida’s hand.

“Why not?” he asked. “We have bested the Duca in fair fight. We have seized his tower. Why not eat his food?”

As he had hoped it would, the suggestion at last settled the matter. A moment later, as Naida nibbled her first bite, she smiled.

“Why, it—it’s good!”

With the question of provisions settled at least for a time, Kirby’s next thought was of the tower. The present lull of peace seemed made for exploration.

“Come along,” he said to Naida, “we’ve plenty to do,” and then, when he explained, they set out, accompanied by Nini, a cousin of Naida’s, and Ivana, a younger sister.

All of the others remained with little Elana.

While they climbed spiral stairs, Naida explained that the chamber they had just left was used by the Duca as a place in which he prayed before and after contacts with caciques or subjects. A sort of halfway station between earth and heaven, as it were, where the Duca might be purged of any sully influence gained from human relationships.

At thought of the rank, egotistical hypocrisy implied by the story, Kirby smiled grimly. Then they came to a new door, heavier than that which barricaded the prayer chamber. Unlocked, the thing swung ponderously at Kirby’s push, and with the three girls pressing close beside him, he entered—and stopped.

“Naida!” he gasped.

“Oh, *oh!*” she cried, and while Nini and Ivana gasped, she clapped her hands in an instinctive, feminine reaction of joy. “But there are things here which I believe none but the Ducas of our race have ever seen! Oh! Why, the sacred girdle is as nothing compared to this display!”

By “display” she meant a treasure which took Kirby’s breath away, which made his heart act queerly.

The walls of the chamber were fashioned of polished blocks of obsidion on which stood out in heavy bas-relief a maze of decorative figures fashioned of pure, beaten gold—the same kind of gold which had gone into the making of the cylinder of gold. With his first glance at the gorgeously wrought motifs of Feathered Serpent and Sun and Moon symbols, Kirby knew to a certainty whence the golden cylinder had come originally.

But even the gold—literally tons of it there must have been—was nothing compared to the gems.

They were spread out in blinding array upon a great

table in the center of the room. There were pearls as big as turkey eggs and whiter, softer than the light of a June morning growing in the East. There were rubies. One amongst the many was the size of a baseball and glowed like the heart of a red star. The least of the two or three hundred gems would have outclassed the greatest treasures of the Crown jewels of England and Russia combined.

Most overwhelming of all, however, was the jewel which rested against a square of black cloth all its own in the center of the table. While his heart still acted queerly, while Naida, Nini, and Ivana hung back, delighted, but still too bewildered to move, Kirby advanced and took gingerly in his hands a single white diamond about eighteen inches long, and almost as wide and deep as it was long.

The thing was carved with exquisite cunning to a likeness of the living head of Quetzalcoatl, the Feathered Serpent.

Kirby dared not guess how many pounds the carven hunk of flashing, blue-white carbon weighed. He

knew only that like it there was no other diamond in the world, and that the thing was real. Naida and the two girls were silent now, and suddenly Kirby realized that to their awe of the gem was added awe of deepest religious nature. Slowly he put the diamond head of the Serpent back upon its square of cloth.

“We—we had heard that this thing existed,” Naida said presently, voice hushed, “but no one except the holy men of our race has ever beheld it.”

“But, what is it?” Kirby asked. “Whence came it?”

However, when Naida would have answered, he interrupted.

“But wait! Tell me as we go. We could stay here for the rest of our lives without much trouble, but we’ve got to cover the rest of the tower and get back to the others.”

It was after they had closed the door to the treasure room that Naida told him the story.

“There is not so much to tell,” she began. “The diamond itself is so gorgeous that it is hard to talk about. But here is the story. A great many ages ago one of the Ducas of our race found the diamond, decided to carve it into a perfect likeness of the head of the Serpent God. All of the craftsmen of the race helped him and when they were done, they took their image to Quetzalcoatl himself, and showed him what they had done.

“Quetzalcoatl was pleased. So pleased, that he promised all of the wise men that he would cease to prey upon them as he had in the past, and henceforward would take his toll of sacrifice from the ape-men alone. Then he hated and would continue to hate because they worshipped not him but Xlotli.

“And so it came about,” Naida went on slowly, looking up at Kirby as they still mounted wide steps to the upper reaches of the tower, “that our people gained immunity from a God which had always before harmed and destroyed them. Our race presently began to build this castle here on the high plateau, and Quetzalcoatl kept his compact with them. He still

comes out of his chasm at intervals and preys upon the ape-men, but no one of our race has seen him for thousands of years, and he has always let us alone. And there is the whole myth and explanation of why the great diamond is revered among us as a holy of holies.”

They had mounted to a new door which Kirby guessed might give entrance to the Duca’s living quarters. But he was in no mood to open it at once.

“Wait a minute,” he said as they all paused. “You say that, although none of your race has seen Quetzalcoatl since the diamond head was carved, he still comes out of his chasm and makes trouble for the ape-men. Just what does that mean?”

“Why—” Naida looked at him wonderingly. “I mean what I have said. The Serpent comes out of his chasm and—”

“What chasm?” Kirby asked sharply.

“Why, the one we crossed this morning. It extends to

the far reaches of our country, beyond the Rorroh forest, where the ape-men dwell but which our people never visit. It is in that distant part of the chasm that the Serpent dwells.”

“But—but—Oh, good Lord!” Kirby whistled softly.

“Naida, do you mean to tell me that Quetzalcoatl was not simply a mythical monster, but an actual, living serpent which is alive *now*?”

Naida and the others shrugged.

“Why not?” she answered. “Sometimes we have captured a few ape-men, and they tell us stories of how Quetzalcoatl kills them. *They* say he is very much alive.”

“But,” Kirby mumbled in increasing wonder, “is this living creature the same which your ancestors worshipped first as long ago, perhaps, as a million years?”

“That,” Naida answered unhesitatingly, “I’m not sure of. Our caciques believe that the Serpent, although it

lives longer than any other sentient thing, finally dies and is succeeded by a new Serpent which is reproduced by itself, within its own body.”

So overwhelming did Kirby find this unexpected sequel to their discovery of the great diamond head, so staggered was he by the fact that Quetzalcoatl, of Aztec myth, might exist as a sentient creature here in this cavern world, that he had little heart left for exploring other wonders.

Nevertheless, he presently pushed open the new door before which they had paused, and behind it found, as he had expected, the Duca’s living quarters.

These were as severe as the jewel chamber had been gorgeous. A thin pallet spread upon a frame of wood formed the bed, and beside it stood a single stiff chair. That was all. The walls of glistening obsidian were bare.

There was, however, a door in one circular wall, and as Kirby flung this open, his previous disappointment changed to delight. For shelves along the walls of the

small chamber held roll after roll of parchment covered with script. And in one corner lay six undamaged, almost new Mannlichers and several hundred rounds of ammunition!

“Naida,” he exclaimed, “do you know what those are?”

“I suppose that they are weapons of the sort you used against the ape-men this morning?”

Kirby grinned.

“They are the same kind I used, and then some. With these weapons we can do what we never could with the smaller one. How did they get here?”

“They came when I was much younger,” Naida answered with a shade of sadness in her voice. “The men who had them penetrated the Valley of the Geyser, coming by a different route from the one you followed. When the Duca learned they were there, he sent such men of the race as were still able to fight to kill them. That order of the Duca’s was one of the first

things to turn me against him. The men were not harming us, and they should have been permitted to go away. But the Duca insisted that they be killed, and in the fight were lost eight of our youngest and strongest men.”

Kirby stooped to inspect the rifles.

“Has no one learned to use these weapons?”

“No,” Naida answered. “The Duca kept them for himself.”

“We think,” put in Ivana, “that he hoped to learn to use them, and was afraid for us to have the knowledge.”

Kirby filled one of the magazines, and felt the heft of the gun with pleasure.

“Very well,” he said. “It looks to me as though your time to learn the art of shooting has come at last. Come, I think we had better be getting back downstairs.”

Kirby took three guns himself, and with the others lugging the rest, they started back. The parchment rolls, he decided, must be left for examination later on.

They were all elated when they rejoined the girls in the prayer chamber, and high spirits were still further increased by the report, promptly given, that all had remained quiet in the amphitheatre. Save only for the presence of Elana, radiant and calm in death, the give and take of questions would have been accompanied by actual gaiety.

But the time of peace did not last much longer. While Naida was in the midst of answering incessant questions about the wonders of the jewel chamber, Kirby heard a sound from below, and suddenly went over to the downward-winding steps.

“Listen,” he called sharply back to the others.

He had not been mistaken. Many footsteps echoed from the amphitheatre, and he made out that the caciques were coming toward the bolted gate at the

foot of the steps. While he listened, and Naida came eagerly to his side, silence fell.

But then clear words came up to them.

“Let the upper-world man come to the foot of the steps,” called the Duca. “I have an offer to make him!”

Chapter 7

To himself Kirby chuckled. Such real entreaty filled the Duca's voice that there seemed no danger of further treachery from him at the moment.

With a grin, Kirby took Naida's hand and led her down the steps, unbolting each bronze gate but the last.

"What do you want?" he asked in a cool voice a moment later, when he stopped on the final step and faced the Duca from behind the protection of the final gate.

Clearly the parley was going to be a blunt one.

"I want you to leave our world," the Duca rumbled promptly.

He was drawn up in a posture intended to display dignity. But his left cheek, where Kirby had hammered him, was pulpy and discolored, and somehow he seemed to Kirby more than ever merely

human.

“Under what conditions am I to leave?”

“If you will vacate my tower at once,” the Duca said with a flush of eagerness which he could not conceal, “I will permit Naida and one of my caciques to escort you back to the Valley of the Geyser. I will also give you directions by which you may travel in safety from there to the outer world.”

Kirby, wanting more details, made himself seem thoughtful.

“And what will happen to me, and to the girls, if I decline?”

Encouraged, the Duca made an impressive gesture.

“You will be left in the tower to die of starvation. Mine is not a complicated offer. It should require no complicated decision. What is your answer?”

Kirby dropped his carefully assumed mask of thought.

“My answer is this,” he lashed out. “I will not leave! The tower is ours, and we will hold it until you have accepted Naida’s peace terms on your priestly oath!”

“But if you stay in the tower you will starve!”
thundered the Duca.

“No, we won’t starve! We won’t starve because we eat the food of Ducas!”

In silence, Kirby took from his pocket a strip of the sacred Peyote and bit off one end of it. Suddenly the hush in the amphitheatre became complete. As he watched Kirby chewing, the Duca gasped and choked.

“Moreover,” Kirby announced with slow emphasis, “I have taken possession of the weapons which you took from men of the upper world, and which have already sent men of your race to their death. I have no wish to kill either you or your caciques, but if you do not presently discuss peace with me, you will certainly find yourself embroiled in a struggle more bitter than the mild one of this morning.”

With that said, he swung on his heel, and taking Naida's hand again, started with her up the steps.

"I have nothing more to say," he called over his shoulder to a Duca whose white haired majesty had been stripped from him.

"We're getting on," he whispered to Naida a moment later. "The best thing for us is just to sit still now, and wait."

With the questions he wanted to ask Naida about her world becoming insistent, he found himself, as a matter of fact, glad for the prospect of further respite. As both of them rejoined the girls in the Duca's prayer chamber, the first thing he did was to take from his tunic the cylinder of gold which he had found in the canyon.

"What is this, Naida?" he asked, hoping to start talk that would make all of them forget the Duca and politics, and at the same time help him to learn much that he wished to know.

But a queer thing happened. Naida's reaction to the carven gold was as unexpected as it was marked.

"*Oh!*" she cried in a voice which suddenly trembled with surprise, with blank dismay. Somehow, the cylinder of gold brought to her face things which not even the Serpent's head of the diamond had evoked.

The prospect of a long session of talk began to fade out in Kirby's mind.

"But Naida, whatever is there about this fragment of gold to startle you as it does?"

By this time all of the thirty-odd other girls had come flocking about them, and all were staring at the cylinder as fascinatedly as Naida.

"Do you see what he has there?" Naida finally asked, ignoring Kirby in her continued excitement.

"Do we *see*?" answered the girl she had addressed.
"Naida, surely it is the carving which was lost!"

Naida was quivering with feeling now.

“Do you realize what it means to our cause that it should have been returned to us in this way?”

The girl to whom she had spoken, and the others, simply looked at her, but in one face after another presently dawned awe and joy.

Kirby stood still, puzzled and interested, until at last Naida was recovered enough to speak to him.

“Where did you get this thing which you call ‘a fragment of gold’?” she asked in a hushed voice.

“I found it,” Kirby answered, “lying beside the skeleton of an upper-world man, while I was ascending the canyon which brought me to the Valley of the Geyser.”

“And you do not know what the cylinder is? But no, of course you could not.”

“*What* is it, Naida?”

Naida glanced at her friends, then laid her hand on Kirby's.

"Next to the great diamond, it is the most cherished possession of our race. In some respects it is even more holy than the Serpent's head. The cylinder happens to be the first work in gold which was ever produced by our people. It was made when the race was new. It was because our first wise men had found they could create things of beauty like this cylinder, that they decided to attempt the creation of the Serpent's head, which is supposed to have brought all of our blessings upon us."

Kirby thought he was beginning to understand the excitement which his introduction of the cylinder had created. He also thought he could see what Naida had meant by implying that the cylinder could be made to aid their cause.

"Tell me," he asked in a mood approaching reverence, "how the cylinder came to be lying beside a dead man's bones."

“It was stolen,” Naida answered in the breathless silence which the others were keeping. “When I was very young, an upper-world man found his way here, and the Duca captured and meant to sacrifice him. But while they were leading him to the temple where such special ceremonies are held—the building stands on another plateau, beyond this—the man broke away. Some of the priests in the procession were carrying the cylinder, for it was an occasion of great importance. The prisoner knocked them down, got the cylinder away from them, and finally escaped by the same route over which you came.”

“And he escaped,” said Kirby wonderingly, “only to be killed by a rattlesnake before he ever reached the civilized world. But do you mean that you never knew your sacred cylinder was so close to you all these years?”

Naida shook her head.

“We never got to the canyon of which you speak, for a special reason which I shall explain some day. And besides that, I think the Duca was afraid of this man

who fought so bravely. So he counted the cylinder as lost. And that is one of the reasons why he killed the men with the rifles, who appeared in the Valley a few years later.”

Kirby looked at her thoughtfully. The mood for discussing all the wonders of this lower world, which had made him bring out the cylinder originally, had quite vanished.

“I suppose,” he said, “that anyone who was responsible for the return of the cylinder to its rightful owners, would be held in some respect?”

Naida nodded vigorously, while little lightnings of excitement flickered in her eyes.

“He might be held in more than respect.”

“What, then, do you suggest that we do next?”

Again the small lightnings darted, and Naida reached for the cylinder.

“Do you mind if I take it for a moment?”

“Of course not.”

Promptly then she faced around.

“Wait here, everyone,” she ordered.

And with that she waved the cylinder in a flashing little arc before their eyes, and darted to the door.

It was all so unexpected that she was gone before Kirby could speak. Slowly, with all of the suddenly gay company of girls following after him, he went to the doorway, and stood on the steps leading to the amphitheatre.

A minute passed. He heard voices downstairs. He heard Naida’s voice ringing clearly, though he could not distinguish her words. He heard a great cry from a score of male throats. More minutes passed. Words that were low and tense poured out in a rumbling volume. Above the rumble, Naida’s voice presently sounded again, clear and sweet, but incisive. Then,

when no more than five or six minutes had gone, Kirby heard the clang of the bronze gate at the foot of the steps, heard light, swift footsteps ascending.

“Naida!” he called softly.

She flashed upward toward him around the last curve in the stairway. Straight to his outstretched arms she went.

“It is done! It is done!” she whispered.

“Tell us!” cried first one girl and then others.

Naida drew away from Kirby at last.

“I told the Duca,” she said to all of them, “that our leader would keep the cylinder for a period of time equal to one upper-world year. If the Duca grants all the terms of peace which we will ask of him, and if he accepts the upper-world man as our temporal ruler, and all goes well for a year, then we will consider replacing the cylinder where it belongs.”

“And what,” Kirby asked exultantly, “does the Duca say?”

Suddenly, without warning, Naida dropped before him on one knee, and from that position gazed up at him laughing.

“He says he will make you our King, to govern all temporal affairs within our realm! He is waiting for you to come and hold a conclave now.”

“What?”

Still kneeling half in fun, half in sincere reverence, Naida held out the precious, potent cylinder of gold.

“Guard it carefully!” she exclaimed. “So long as you keep it away from the Duca, making him hope to win it back, he will consent to almost anything. Yes, he is waiting with the caciques in the amphitheatre now; waiting to draw up terms of peace.”

Chapter 8

To be King amongst these people! A queer sensation tugged at Kirby's heart as he descended the steps with Naida at his right, and all of her—and his—dainty and gracious friends following after. Yet, intense as his emotion was, never for a second was he able to doubt the evidence of his senses which told him that all of this was real. As they descended the black steps of the tower, Naida's sweetness, her grace, the warm humanity of her, made him humble with gratitude for the extraordinary fortune which had come to him, an unromantic aviator born in Kansas.

Then they were standing in the brilliant light of the amphitheatre, and the Duca, surrounded by his caciques, was advancing to meet them.

It was not a long conference which followed. Kirby saw from the start that the Duca was indeed ready to come to terms. So treasured an object, it seemed, was the cylinder of gold, that the mere fact that Kirby possessed it made the Duca respect the possessor,

whether he would or no. With this initial advantage, it did not take long to make demands and win acceptance.

It was agreed that some systematic campaign of extermination should be planned and carried out against the ape-men. Further, the project for eventually bringing other upper-world men to the realm was accepted. Most notable of all, it was agreed that while the Duca should retain a voice in the regulation of temporal affairs, Kirby should possess an absolute veto over his word.

Naida said there must be some formal ceremony to celebrate Kirby's ascendancy to power. To this the Duca consented, and established the date as a fortnight hence, and the place as the temple on the plateau beyond the plateau of the castle, where the Ducas had been invested with their robes of state from time immemorial. At the end, it was decided that little Elana should be left in the prayer chamber until a burial ceremony could be held on the morrow.

In less than an hour, Kirby, Naida, and the others

withdrew from the amphitheatre to return to the regular dwelling places of the girls. Deep in his mind, Kirby did not know how sincere the Duca was, and fear lingered, somehow, but he put it aside for the present.

As they came out of the castle, proceeding in a gay procession across the drawbridge above the moat of beautiful aquatic plants, Kirby saw that the light from the glass sky was fading to a glow like that of spring twilight in the upper world. Naida answered his question about the phenomenon by saying that day and night in the cavern corresponded to the same period above. What quality of the glass sky gave out light, she did not know, but it seemed definite that the element was sensitive to the presence of light in the upper world, and when the sun sank there, the glow faded here.

A flower embroidered path led them around the castle to a group of little crystalline houses all overgrown with bougainvillea vines and honeysuckle. In front of the first, Naida paused, and while the others went on to the other houses, she looked at Kirby.

“It is Elana’s dwelling,” she said simply, “and it will be vacant now. Elana would want you to take it. Will you, please?”

The twilight was deepening swiftly. Kirby nodded reverently, then drew close to Naida.

“Naida?”

“Yes?”

He took her hand.

“I can stay here, I can consent to become, after a fashion, a King, only if you will reign with me as Queen. Will you, Naida? Will you love me as I have learned to love you during this single day in Paradise?”

She did not answer. But presently Kirby’s mind went blank for sheer joy. For then Naida raised her face, and he kissed her lips.

It made no difference then that, despite the day’s

victory, Kirby could see trouble ahead, and feared, rather than rejoiced at, the Duca's too easy acceptance of terms. The future could take care of itself. This moment in the dusk belonged to him and Naida.

The two weeks which passed for Kirby after that particular twilight sped quickly. During the first morning, all attended the ceremony which was held for Elana's burial in the plot of garden ground where lay her ancestors. Ensuing mornings were devoted to conferences in the amphitheatre with Duca and caciques.

After the fourth day Kirby, at Naida's insistence, moved into splendid quarters in the castle—a suite of chambers across the amphitheatre from those in which the caciques dwelt. In practically forcing the move on Kirby, Naida won his consent finally by agreeing to have their wedding ceremony performed on the day of his coronation; then she would come to the castle with him.

The afternoons of that first fortnight before the

wedding and coronation were spent in hunting and fishing. Also Kirby and Naida visited often the aged people of the race, who dwelt in crystalline, vine covered houses like those of the girls, but removed from them. Naida's relatives were dead, but she had relatives there, and to all these aged ones, who sat living in the past, she did what she could to explain present developments in the affairs of the younger generation.

Last but not least, Kirby set aside certain hours each afternoon which he devoted to the formation of a rifle squad amongst the girls. Six rifles he had, and in turn he trained each of the girls in their use, having set up a range at the foot of the plateau cliffs. The results he gained made him feel that the day would come soon enough when he would dare launch an offensive against the ape-people; and especially pleasing was the sense of power over the Duca which he gained. The Duca showed no sign of treachery. Yet Kirby did not trust him. Never did he quite forget the misgivings which had lingered in his mind after the first conclave.

As for his relationship with Naida, that grew with every moment they could steal to spend with each other. And side by side with their growing knowledge of each other grew, for Kirby, an increasing store of knowledge of the realm.

He learned, amongst other things, what seemed the origin of the worship of the Serpent, Quetzalcoatl, amongst primitive Mexican races. The time had been when the People of the Temple had mingled freely with the races above them; and, that they might have ready means of egress to the world, they had built the tunnel through which Kirby had entered the Valley of the Geyser. Thus, going and coming as they did, they had spread their cult of the worship of Quetzalcoatl; and when, eventually, strife arose between the peoples of upper world and lower, and the People of the Temple withdrew to their realm, they left behind them the Serpent myth which was to live through countless centuries.

The tunnel, Naida said, had been abandoned when her people left the upper world once and for all, and its use for any reason prohibited. This, Naida gave as

the reason why none of them went near the tunnel now, and why the cylinder of gold had lain in the canyon undiscovered. It was the explanation she had promised on the day in the tower, when first she saw the cylinder.

So the days passed, until the day set aside for wedding and coronation dawned. On that morning, Kirby, having concluded a long conference with the Duca, was walking with Naida in the gardens outside the castle.

“Tell me,” he said to her: “do you yourself believe that this Serpent has the powers of a God?”

Naida looked at him quickly, a sudden fright in her eyes.

“I believe the Serpent exists to-day, somewhere in the distant reaches of the chasm, beyond the Rorroh forest.”

“Yes, but do you believe the Serpent is God?”

Actually frightened now, she looked swiftly about. But when she saw that they were alone, confidence returned.

“No!” she exclaimed. “I do not believe Quetzalcoatl is a god. I believe he is the most terrible creature anywhere in our realm, and that men first worshipped him through fear. I believe our race would be better a hundred times if they had never made him their God.”

Kirby whistled.

“Then you do *not* believe that the Ducas of past ages talked with him. You do not believe it was Quetzalcoatl’s pleasure over the great diamond which made him cease preying on your people?”

“No! Long habit makes me show respect for these myths, and adhere to the customs of our cult, but I do not believe. I think our race gained immunity for the Serpent’s ravages, not through a compact with Quetzalcoatl, but because our builders were intelligent enough to erect the castle up here on the plateau, where Quetzalcoatl could not reach them. To

tell the truth, I think the whole cult is false and wrong, and I wish Quetzalcoatl were dead and gone from the world!"

Kirby smiled. In spite of Naida's reverence for certain features of the cult, he had long suspected that her true feelings were those she had just expressed. And he was glad for this new bond of understanding between them. He glanced at her with understanding and perfect trust.

"Naida, since we have talked so frankly, there is one more thing which I must bring out."

She looked up at him.

"What is it?"

"The Duca."

She drew closer, her perfumed body brushing his, her great eyes caressing him.

"Naida, I am afraid of the man."

“And so am I!” she confessed suddenly.

“It has all been too easy,” Kirby said in a slow voice.

“There is no doubt whatever that our possession of the cylinder of gold has had great influence on the Duca, and yet—”

He paused, taking her hand.

“And yet,” she went on for him, “you do not believe he would have conceded what he has, unless he intends to make trouble?”

Kirby nodded twice, emphatically.

“Well, you have trained all of us to use the rifles.”

He smiled gravely at her understanding.

“Yes, I have. And your skill, and that of the others, with the rifles, will always help us. Yet even so—”

Closer still she drew now, and there was sadness in her eyes.

“I think I see,” she said in a voice which choked.
“When do you think he will make a move to start trouble?”

Kirby hesitated, then drew a long breath.

“To-day!”

“On—on the day of our union?” Naida echoed in dismay. “Can you tell where or how he will strike at us?”

Kirby shook his head.

“There are a hundred things he could do. Naida, I—I—Well, somehow I am afraid of the ceremony this afternoon—the wedding ceremony!”

He felt a little shiver go through her, and would have taken her in his arms, save that a gay cry rang in the garden then.

“Naida, Naida!” It was her cousin, Nini, a bronze-haired youngster as elfin and Pucklike as her name. “I

thought we should never find you! Do you realize this is your *wedding* day, and that you're acting as if there was nothing to be done?"

Nini darted a mocking glance at Kirby, who grinned.

"Do come, Naida!" cried another girl. "Your gown is ready, and we want you to ourselves for awhile."

Other girls joined them, some singing and some carrying an obligato on the sweet, flutelike instruments which Kirby had first heard as he hung in the throat of the geyser. In front of them all, Kirby laughed and kissed Naida on the forehead. But as he took leave of her thus, he whispered:

"We must not let our guard relax for a second this afternoon. And I think there is a more definite precaution which I will take, besides."

Chapter 9

Some hours later, Kirby smiled with tight-lipped satisfaction at thought of that precaution which he had taken. What it was only he, Nini, Ivana, and three other girls knew, which secrecy pleased him as much as the precautionary measure itself.

Seated alone in a dimly-lighted, thick-walled cell of the ancient temple in which the dual ceremony of wedding and coronation would take place, he was waiting for the moment when the festivities would begin. Thus far the Duca had done nothing. Yet Kirby's uneasiness would not leave him, and he continued to be thankful that, if trouble should start, the Duca might not find as many trumps in his hand as he expected.

A couple of hours after Kirby had left Naida and the other girls in the garden, all had begun the two-mile journey from the castle to the small plateau on which stood this temple, where the ceremony would be held. Now, while Kirby waited alone, the Duca and his caciques had gone to another wing of the temple.

Naida, attended by her bridesmaids, had been assigned to a cell of their own, and the rest of the girls were waiting in the nave of the temple. Unable to attend the walk from their plateau to this, the old people of the race had remained in their crystal houses.

With ten minutes more to wait, Kirby rose from a bench on which he had been seated, and began to pace his cell. It was this archaic pile of stone, he finally decided, which was causing his depression. Unlike the bright and cheerful castle, this place, older than any other building in the realm, was squat, thick-walled, and gloomy. Here, in the dusky cells which lined labyrinthine corridors, the early generations of the race had found protection from outside dangers. All of which was all right, Kirby thought, but just the same he wished he had insisted upon being wedded in the brilliant and cheerful amphitheatre.

But presently he stopped pacing and faced the door of his cell. Then he breathed a sigh of relief.

From down the twisting corridors which wound out to

the central nave, stole the high sweetness of soprano voices, the whisper of flutes, and the mellow resonance of little gongs of jade and gold. It was the signal for which he had waited.

It had been the Duca's instructions that he should come out into the temple when the music began, and meet Naida there. Both would advance to the altar, and when they were in place, the Duca would come to them. Kirby, therefore, after a glance at the blue trousers and tunic of tanager scarlet which the girls had made for him, opened the door of his cell, and stepped out.

In a moment he traversed the windings of the corridor, and halted under a flat arch at one side of the temple nave.

As he paused so, to await the appearance of Naida and her bridesmaids under a similar arch directly across the temple, he held his breath. Not even nymphs could be as graceful as were the twenty-six girls who were performing the dance of Life Immortal, which tradition decreed should be given

before the ceremony by which, in this realm, two souls were wedded. The flash of rainbow gowns was like the swirling of light in a sky at dawning. The music of voices, flutes, and the little gongs of jade, would have stirred the souls of the dead.

If only the confounded sense of approaching disaster would leave him, Kirby thought grimly, this would be a magnificent moment. As it was, he turned his eyes away from the girls, and began to examine the temple.

Just as Naida had told him the case would be, he found both sides of the nave surrounded by arches similar to the one under which he was standing. Everywhere, dim and tortuous corridors led to cells like the one he had just left. Then, in one end of the nave, loomed a closed door from behind which the Duca and caciques would appear when the couple to be wedded were in place, before the altar.

The altar itself, a rectangular mass of some jadelike stone, stood at a distance of perhaps twenty paces in front of the closed door. On top of the greenish

stones, resting on a cushion of some crimson material, flashed the crown which would be used at the coronation. Kirby's eyes widened as he beheld a single rose-cut diamond two inches in diameter, mounted in an exquisitely simple bandeau of wrought gold. But, a moment later, even the crown which would be his—if nothing happened—seemed only a bauble compared to the other prize which he had won in this world beneath the world.

Naida!

He realized that the dance was ended, the music stilled, and that the rainbow garbed girls had formed a double line in the center of the temple. Suddenly his heart beat fast, and for just a moment, as he dared look full and deeply at Naida, and she smiled back at him across the distance, he even forgot to be depressed.

But even as he advanced to meet her, his uneasiness returned.

Now the girls were singing again, their voices raised

in a triumphant chorale as beautiful as Naida's face with its warm red lips and smiling eyes, as beautiful as her wedding gown that might have been woven, in its filminess, of mist from the sea. The bridesmaids, silent, their lovely faces alight, paused. But Naida came on.

From her floated to Kirby a fragrance more overwhelming than even the perfume of the geyser. Presently he felt her hand on his arm, and at last they stood side by side. Now again, his premonition of evil left him for a flash; but again it returned.

"I love you," he whispered.

"I love *you*."

"But I am still afraid."

Naida's smile faded.

"And I too. Oh, I've been terribly afraid! We will keep our guard!"

“Yes.”

In front of them, on the altar, the crown diamond winked and shimmered in a dim light. The swelling chorus of triumph, in which the bridesmaids had joined now, made the whole temple ring. Slowly, while Naida moved easily beside him, Kirby began to march to the altar.

Then it was done, and they were halted. After both of them had given a lingering glance at the crown whose diamond shimmered now within their reach, they raised their eyes to the closed door behind the altar.

The thing was swinging open. An inch it moved, two inches.

Kirby waited, never taking his eyes away from the widening crack. With a crashing final volume of sound, the chorus swept magnificently to its climax. Then the door was flung wide.

Still Kirby stood stiffly before the altar, with Naida drawn up splendidly beside him. After two seconds, however, he moved.

Duca and caciques were not standing in the corridor.

In the semi-darkness, the only figures visible there were squatting, grotesque things whose bodies were covered with whitish hair and whose leathery faces were disfigured by gashes of mouths filled with enormous teeth.

A feeling of standing face to face with final disaster, turned Kirby sick. As he jerked back from the altar, sweeping a paralyzed Naida with him, the ape-men let out gibbering howls, half-human. With gigantic, hopping strides, the foremost rank of the creatures swung forward, straight into the temple.

Chapter 10

Kirby, already falling back toward the other girls, caught Naida up in his arms, and ran.

“Nini!” he bellowed. “Ivana! Get the rifles!”

While the two whom he had ordered sprang to a corridor, and four others followed, Kirby fell in with the others and dropped Naida on her feet. Sick as he was, there was still a ray of hope, because the hard-headed precaution he had taken against treachery this morning was to have Nini and Ivana bring the rifles here and hide them.

The first of the ape-men, snarling, laughing, had hopped beyond the altar, and the yellow foam of madness was slavering from his jaws. Over his shoulder he howled some jargon which made his hairy legion struggle to catch up with him.

“Have you got any puff balls?” Kirby snapped at Naida.

She shook her head numbly, just as Nini and Ivana swung forward with the Mannlichers.

“No. But you had sense enough to bring the rifles! Oh, what does it mean?”

“The Duca has sold himself out to the ape-man! He was helpless against us, and has brought them to destroy us for him. Here, Ivana, give me a rifle! Everyone for herself!”

The next moment he had a Mannlicher at his shoulder.

As the thing kicked, an ape who would have reached him in two more jumps crashed over with his heart torn out, the temple echoed with sound which threatened to rip its solid walls apart, and bright flashes at Kirby's right and left told him that other rifles were getting under way.

He fired again, twice more, slaughtering an ape with each shot. The five other rifles were creating havoc.

Blocked by a dozen torn and bleeding bodies on the floor, the reenforcements which still poured from the corridor, began to mill around amongst themselves, and the forward charge slowed down. All the panic which had sent the ape-men scuttling from the beach at their first experience of gunfire, seemed ready to break loose again now.

Kirby felt it was good enough for the work of a minute.

“Get into line as I showed you how!” he shouted.
“Rifles in the front rank, the others behind them.
We’re all right now! Keep firing!”

“Keep behind me!” he ordered Naida, still unarmed.

Then he placed a shell in the chest of one brute who was broader and heavier than the others—a leader—and saw that he had increased the demoralization; and from the hastily-formed front rank a volley leaped hot and jagged.

Then the rout which had threatened broke loose. As

eight ape-men slumped into blubbering, bleeding heaps, the milling remainder of the horde turned, and in a fighting, scrambling frenzy attempted to get back to the corridor.

Kirby let his triumph take the form of thoughts about what he would do to the Duca when that personage could be rounded up.

“Follow after them!” he ordered. “Don’t stop until we have located the Duca. He is the one we must settle —”

But he never finished.

As he himself, holding fire for a second, prepared to follow up the retreat, he found himself confronted by the utterly unexpected.

A voice unquestionably the Duca’s began to shout orders at the ape-men from somewhere down the corridor! And, riot or no riot, the tones of that voice seemed to inspire the creatures with more fear than the rifle fire.

So suddenly the change came, that by the time Kirby flung his rifle again to his shoulder, the crazy retreat had been halted, and as he fired again, the ape-men swung in their tracks and began to charge!

There was no time to guess by what power the Duca had turned the tables. There was not even time for orders. Kirby fired twice, knowing that the ape-men had been infused with some spirit which would bring them on in spite of rifle fire.

Naida, unarmed, cried out behind him, and he shoved his gun at her.

“Take it!”

He had just inserted a new clip. He handed her others.

“Fire for your lives!” he shouted to the girls.

“But you!” Naida gasped. “You are unarmed!”

“I’ll be all right.”

On the floor lay a jagged, hand-chipped knife of obsidian which had fallen as some ape died. Kirby grabbed it.

In another second the flood of ape-men had burst in all its fury over him. Crashing, thundering shots were dinning in his ears, animal death screams and the Valkyrie battle cries of the girls filled the temple. He could not tell how many of the apes were fighting him. As a cave-man's club whizzed past his head, he drove his knife once, and yanked it dripping from hairy, yielding flesh to plunge it again. A sudden side-step carried him away from another assailant. He dropped the knife to snatch the gigantic club of one of the creatures he had killed.

Quicker in every movement than the ape-men, he laid on, right and left, with such power that blood spurted in a dozen places, and heads were split open on every side. And because of his speed, the frantic, clumsy blows and knife thrusts which were directed at him proved harmless.

A terrific drive which smashed a snarling face into

pulp, left Kirby free for a second, and he emerged from the first round of battle ready to cut in and help the girls. But then he saw that he had gotten separated from the main body.

“Naida!” he called. “Naida!”

A series of shots answered him, and as several apes fell, a gap was opened through which he saw her conducting a well ordered retreat of all the girls toward the dark corridors surrounding the temple. Again Kirby fell to with his club, swinging, hacking, fighting with his whole strength to catch up. He made headway, and hope began to come again. The ape-men would not kill, or even harm, the girls. What they wanted was to carry them off. If he and Naida together could get their party rounded up in the corridors, the chances were good.

“Naida!” he shouted again. “Coming!”

Battering down an ape in front of him, he jumped up on the corpse, and saw that already the vanguard of girls had reached the first sheltering corridor. Naida

had been cut off from the others by eight or ten apes. But even so her fire made her mistress of the situation, and she seemed all right.

It was just as Kirby started to jump down from the corpse that he saw something which put another complexion on the matter, and left him frozen where he was.

Behind Naida, directly in the path in which her slaving aggressors were slowly forcing her, a huge stone slab in the temple floor had begun to tilt up as if it were a trapdoor raised by an invisible hand. Within the yawning opening, Kirby caught a glimpse of stone steps winding down into blackness.

In a flash he saw that it was Naida, and her alone, that the ape-men were after. The Duca's determination was to capture her, and it was the presence of this trapdoor, making capture possible, which had brought on the second charge of the apes.

A scream, high and wild, from Naida released Kirby from his trance of horror. He leaped off the corpse,

and smashed a suddenly presented skull like an egg shell. Momentarily he saw Naida, too terrified to fire, staring at the open trapdoor. Kirby felled two apes and felt their blood on his arms.

“Ivana!” he yelled. “Help Naida, for God’s sake!”

An answering shout, not from Ivana alone but from many girls, encouraged him, and he swung his club with a speed and force which would let nothing stand before him. But then another scream from Naida rang in his ears.

“Naida!” he shouted. “It’s all right! We’re coming!”

He knew, though, that it *wasn’t* all right. Fighting like a maniac, he opened another lane down which he glimpsed her. Fighting still, in a last terrific effort to force his way down the lane to her side, he saw the black opening gape at her feet; and, as Naida screamed again, a dozen hairy arms reached it at once, twisted the empty rifle out of her hands, and lifted her shining body as if it had been a feather.

Shouts and murderous fire were coming from the other girls, and Kirby swung his club as never before. But even as he fell upon the last two or three apes which kept him away from Naida, those who had snatched her, bolted down the steps.

Kirby was left with the memory of Naida's great eyes fixed upon his, fear-filled, beseeching his protection. In a second, the ponderous trapdoor crashed into place, and she was gone.

Chapter 11

Dazed and grief-stricken, Kirby stood in the bloody, corpse-filled nave of the temple, surrounded by thirty-two girls whose faces were blanched and most of whose eyes were tear-bright. The fight was over, and they were assembled to decide what must be done, but for a time no one spoke.

Gaining the trapdoor just as it was pinioned from beneath, Kirby had torn at it with bare hands. But that had been hopeless. Then he had begun to fight again. But that had been hopeless also. With howls and screams they started to retreat, and it had not taken Kirby long to find out that every part of their raid had been carefully planned, even to this retreat under fire. Straight into the damp black tunnel which led away from the corridor behind the altar, the apemen had leaped. And Kirby, in hot pursuit, had heard the Duca's voice driving them on. Too much the soldier to follow in that darkness where the Duca knew every foot of the way, and he knew nothing, Kirby had seen that he must go back to the girls and take stock.

Now he looked at the strewn ape corpses, smelled the corrosive reek of burned powder, and tried to put aside his grief.

“The Duca,” he said at last, “must have been planning this with the apes ever since the first morning in the castle.”

Ivana, Naida’s sister, nodded.

“The Duca brought the ape-people here, kept them in the tunnel, and then herded them back when their work was done. I suppose it was one of the caciques who opened the door when the time was right.”

“Does anyone think we ought to try the tunnels now?” Kirby asked.

Several girls shook their heads. He knew that already they felt he had been wise in giving up the pursuit. Ivana spoke.

“If the Duca and his horde stay underground, we shouldn’t have a chance against them. And if they

don't, we're better here."

Kirby shot a searching glance at her, somehow sure that her thoughts were running parallel with his.

"You don't think they're going to stay here, do you?"

"No, and you don't either," Ivana answered.

"It seems to me that they will retreat into the Rorroh as fast as they can," Kirby then observed.

And do you think the Duca and all the caciques will go with the apes?" This time it was Nini who spoke, and with the council so well launched, Kirby began to feel better.

"I think," he answered Nini, "that the Duca has gone over to Xlotli altogether. We fooled him to-day. Instead of killing or capturing us all, he—he only got Naida. But he won't give up. I think he is taking the apes off to some place from which he can launch a new attack. And we've got to stop him before he is ready to deliver another blow."

“What do you mean?” Ivana now asked.

“Do you know where the villages of the ape-people are?”

“Yes. None of us has been very far into the Rorroh, but I could guess where some of the villages may stand.”

Silence fell after that, but Kirby knew from the glint in Ivana’s eyes, and the quick breaths which other girls drew, that they understood.

“Ivana,” he said suddenly, “will you go with me into the Rorroh jungle, and stay with me, facing down every danger it may conceal, until we have found Naida and brought her back?”

A flush of life crept into Ivana’s pallid cheeks.

“Yes!”

Kirby faced the other girls, all of them keyed up now.

“Nini, will you go?”

Nini, bronze-haired, dainty nymph of a girl, who had yet the stamina of a man, looked at him with brave eyes. Then her hands tightened on her rifle, and she stepped forward.

“When will you have us start?” Ivana asked in a low voice.

“Now!” Kirby answered, and, taking up the rifle which lay beside him—the same with which Naida had fought—he looked at the other girls.

“There is not one of you,” he said slowly, “who would not go willingly on this quest. But the pursuit party must be small and mobile. And there is another duty. To all of you I leave the care of the castle and the plateau. Take the three rifles I shall leave behind, do what you can to reassure the old people, and hold the plateau safe until we return.”

A murmur of girls’ voices sounded in the temple. Kirby motioned to Nini and Ivana, and followed by a

low cheer, they moved off together.

The night was on them, where they crouched in a cave above a swiftly flowing river. Kirby, rifle across his knees, sat peering out across the black, invisible stretches of the forest. His nostrils quivered to this mingled smells of fresh growth and fetid decay of the grotesque land. In his ears shrilled the creaking and scraping of insects, the flap of unseen wings, the distant bellowing grunt of some unseen, unknown animal.

“I cannot sleep,” Ivana said presently, from back in the cave.

“Hush,” he whispered, “you will wake Nini.”

“But I am already awake!” came her answer. “I—I cannot forget the white snakes which slid from that tree when you tried to cut firewood.”

“Hush,” Kirby murmured again. “Presently the moon will rise on the earth above, and light will come here. Even if the jungle is terrible, were you not born with

courage? Go to sleep now, both of you, because you must relieve me soon.”

As silence fell again, he knew that the real thing behind their nervousness was their ghastly doubt about what the night was bringing to Naida. But none of them spoke of Naida. So sickening were the possibilities that Kirby would not permit conjecture to occupy even his mind when, at length, the sound of even breathing told him that Nini and Ivana slept.

After dreary passing of an hour, a faint light grew over the jungle, silver and clear, and Kirby let his mind run back to the two deserted ape-men communities which they had found and searched before dusk sent them to the cave. From the signs of hasty departure, it looked as though a far-reaching order had taken the brutes away from their dwellings, and sent them—somewhere.

That somewhere seemed likely to be the great central community which Ivana said was rumored to exist in the far reaches of the Rorroh. The problem was how to locate the community through the hideous country.

But Kirby presently drove the question from his head. To-morrow's evils could best be faced when morrow dawned.

Enough light had grown now so that the swirling bosom of the river, and a strip of sand directly below the cliff in which their cave was set, were visible. As Kirby let his eyes wander to the lush growth beyond the sand, he heard something which made him stir uneasily. Some creature which suggested power and hugeness immeasurable was moving there.

The brush parted, and he saw plainly an animal with the bulk of a two-story house. On two feet the nightmare thing stood, as lightly as a cat, and then came down on all four feet as it ambled out on the sand and extended into the lapping river a tremendous beak studded with teeth. A smell of crushed weeds and the musty odor like that of a lion house filled the night. The tyrannosaur—it was more like a tyrannosaur than anything else—breathed heavily and guzzled in great mouthfuls of water.

Kirby sat perfectly still. He hoped the thing would go

away. But the tyrannosaur did not go away. All at once it hissed loudly and stood up, its eyes glowing green and baleful, and Kirby leaned forward.

From the water was slithering another creature with a gigantic, quivering, jelly body. Kirby saw to his horror that, in addition to four short legs with webbed, claw-tipped feet, there sprouted from the body a number of octopus tentacles. From the scabrous mottle of the head, cruel, unintelligent, bestial eyes glared at the rearing tyrannosaur.

One of the serpentine tentacles whipped out, slapped against the tyrannosaur's fore-shoulder to call forth a hiss and a short bellow. Then other tentacles waved in the moonlight, and in a flash the tyrannosaur was enmeshed as by a score of slimy cables. He was not altogether helpless. Suddenly the steam shovel of a beak buried itself in the jelly body of the water animal, and there spurted out a flood of inky liquid. The water animal emitted a sickening gurgle. But the tyrannosaur's advantage was only temporary. Closer and closer drew the ugly, scabrous tentacles. The tyrannosaur never had a chance. Its green eyes flared,

the shovel beak plunged and slashed, but never for a second did the tentacles relax. As Kirby stared, he saw the water animal begin to back up, dragging its gigantic enemy with it. For a second the whole night was hideous with the sound of hisses, gurgles, dashing water. Then the river boiled once and for all, and both animals sank in its depths.

Kirby chafed cold hands together and shivered a little, then turned to see if Nini and Ivana had heard the struggle.

Fortunately, however, they still slept. And as if this peace which was upon them were an omen of good, the jungle continued quiet for the next hour. Kirby wakened them at last, and after a snatched nap, was in turn awakened.

The three of them started again when the first glimmerings of dawn came to the forest. Of food there was plenty—fruits which grew in profusion, and some roots which Nini grubbed out of the earth. Having started along the first trail which they encountered beside the river bank, they ate as they walked.

Kirby judged they had kept their steady gait for more than two hours before a slight widening of the trail roused him from the preoccupation into which he had fallen.

“See there,” he exclaimed to both girls, and pointed at a grove of trees with fanlike leaves which towered up to the right of the trail. “What are those big bundles fastened to the lower limbs?”

Ivana glanced at Nini, who nodded as if in answer to a question.

“This must be one of the places where the ape-people leave their dead,” Nini answered. “The bundles—But come over to them.”

Kirby forced his way ahead until he stood beneath a huge, unsavory bundle wrapped in roughly woven brown fibre, and wedged in a fork between two limbs. Judging from the ugly odor which overhung the grove, there could be no question about what the bundle contained. Nini and Ivana, glancing at the scores of similar bundles which burdened the trees of the

whole grove, made wry faces. Kirby slung his rifle in the crook of his arm, and nodded toward the trail.

“There must be a village somewhere near,” he said.

A mile farther on they found what they were seeking, a colony of seventy or eighty conical dwellings of mud and thatch, which were ranged in a double circle about a central common of bare, well-trodden earth. It took no long reconnaissance to discover that the town was deserted completely of all inhabitants.

Ivana beckoned and darted to one of the nearest huts, and Kirby, following her, found lying on the uneven earth floor within, a half-skinned animal which resembled a small antelope. An obsidian knife beside the carcass, the disordered condition of a couch of grass, the sour odor of recent animal occupancy, all told their story.

“The owner left in a hurry,” Kirby observed aloud.

Nini, who had gone beyond, to a larger hut which might have belonged to a king ape, called out

excitedly to them.

“A great number of apes have eaten a hurried meal here!”

Kirby entered the shadowed, foul-smelling interior of the central hut to find her statement true. Broken meats, some raw, some cooked, lay on the dirt floor, and scattered bits of fruit were mingled with them. The ashes of a burned out fire at the hut entrance were cold, but had not been for long.

“Do you think—” Ivana began.

“I think the whole of the Duca’s horde came this way, fed, and went on, taking everyone with them,” Kirby finished.

“But which direction did they take?” asked Nini, who was standing at the door of the big hut and had already begun to examine the crowding, green, inscrutable walls of jungle which foamed up to the clearing on all sides.

No less than seven trails wound away into the dark country beyond, and Kirby saw that the question would not be an easy one.

Having hastily circled the clearing and peered down one trail after another without finding a clue, he knew that it was the Duca's intelligence which had made the ape-people depart without leaving even tracks behind them. He did not like the situation.

"Well," he rumbled to his companions, "we may as well take our choice. One chance in seven of coming out right!"

But the words were hardly out of his mouth before he pulled himself up with a jerk, and cursed himself for having given in.

"Ivana! Nini!" Sharpness, a sudden ring of hope edged his voice. "Am I seeing things, or is that—"

As he pointed to a huge aloe bush down one of the trails to their left, they started to run. Then Kirby knew that he was not seeing things. What his first

inspection of the trails had failed to show, he saw plainly now.

Tied loosely to one branch of the aloe bush, almost concealed amidst the deep green of foliage, was a bit of white cloth! In a second Kirby was holding out to his companions a tiny strip of Naida's wedding gown.

"She knew we would come!" He stared down the trail with narrowed, keen eyes.

How Naida had contrived to leave her signal was more than they knew. The fact that she *had* done so, sent all three of them down the trail at driving speed.

An hour passed, then another, and the morning which had been barely born when they first took the trail, wore on to the sultriness and vast, colored light of a tropical noon. Twice the main trail forked, and twice they found an unobtrusive bit of cloth to guide them beyond the works. When the hands of Kirby's still useful watch pointed to twelve, they paused to eat and rest. Then they pushed on.

Meanwhile, the country through which they passed left Kirby with a clear understanding of why Naida and her people had shunned the Rorroh forest down the centuries of time.

Just one thing which stuck in his head was the sight of a small creature like a marmoset, sticking an inquisitive nose into the heart of a sickly-sweet plant which resembled a terrestrial nepenthe. No sooner had the little pink snout touched the green and maroon splotched petals, than the plant writhed, closed its leaves, and swallowed the monkey whole. Little squeaks of agony and terror sounded for a moment, and ceased.

At midafternoon they paused in a spot where a forest of trees with whorled tops were slowly being strangled to death by immense orchids of every conceivable shape and color, and by a kind of creeping mistletoe which grew almost as they watched. Here also, the ground was covered with fluffy, grey-green moss which seethed constantly as if it were a carpet of maggots. Both Ivana and Nini warned Kirby on his life not to touch or go near the

moss, and a moment later he knew why.

From the forest came the flash of a small, five-toed horse being pursued by some animal with a hyena head that barked. At the edge of the mossy glade the hyena swerved aside, but the terrified horse plunged straight out on the carpet of moss. Instantly the air was filled with the sound of animal screams, and a series of tiny, muffled explosions. A cloud of greenish-red mist swirled about the horse. Quivering, still screaming, the animal went down on its knees, and as the reddish green smoke fell on him and settled, it became a mass of growing moss spores.

Before Kirby's eyes, the pitiful animal was covered by a shroud of green that spread over him and cloaked him, licking over all with tiny sounds like far off muffled drums as fresh spore cases developed and burst. The screams died. Even as Kirby drew the girls to him and they passed on, the horse's nostrils, eyes, mouth were filled with choking green moss; and he lay still.

On and on, deeper into the jungle Kirby pushed, and

never for a moment did his companions falter. But the way was not so easy now, for nerves were jaded, muscles sore, and no human will could have been powerful enough to cast aside the growing fear for Naida.

Fear came finally to a head when, toward dusk, Kirby sighted a fork ahead of them, approached it confidently to look for Naida's sign, and found nothing.

"Oh Lord!" he muttered, and realized that it was the first time any of them had spoken for long.

"There must be something to guide us!" Ivana exclaimed as she searched with questing eyes through the swiftly deepening gloom of evening.

Nini, making an effort to keep up hope in spite of the paleness which came to her lovely face, darted down both paths, glancing as she went at every bush and shrub. But she returned in a moment, and as she shook her head, her great eyes were somber.

Kirby grunted, scratched behind his ear. Then, however, he stifled an exclamation, and clutched at the hands of both girls.

On one of the two trails appeared suddenly in the dusk an ape-creature. Kirby saw at once that the thing was small—a female undoubtedly—and that it had spied them and was moving toward them with all speed. And borne in upon him most certainly was the fact that the ape-woman was making signals of peace. In her outstretched hand flickered through the gloom a strip of cloth that was gauzy and white.

Again—a strip of Naida's gown.

"If you know any words of her tongue, call to her," Kirby said sharply.

Ivana obeyed. All three of them started forward. The ape-woman, after returning the hail in creaking gutturals, came up to them, and with an unexpected look of pathos and entreaty in her face, began to address the girls with a flood of talk.

Word after creaking word she poured out while Nini and Ivana listened in silence. Finally Kirby could stand the suspense no longer.

“What is it, Ivana? What does she say? Your eyes are lighting up with hope! Tell me—”

Ivana smiled and turned toward him, while the ape-woman still looked her entreaty.

“She says,” Ivana announced bluntly, “that she and the other women amongst their people, do not want any of the girls of our race to be taken by their males. Already the men are quarreling about Naida. They will not look at their own women. Naida told this woman that we would be following, and sent her to lead us to the place where the ape-people are assembling!”

Kirby felt his lips tightening in a grim smile at the thought that jealousy was not unknown even to the semi-human creatures of this neither world. He looked at Nini and Ivana during a stretched out second. Then he moved.

“Good,” he snapped. “We go on at once.”

That was his only recognition of what was surely one of the important happenings of a lifetime. But for all that, his tired brain, which so lately had felt the chill of black depression, was suddenly set on fire with triumph and thanksgiving.

Chapter 12

As they marched rapidly, the ape-woman, who called herself Gori, succeeded in making them understand that most of the ape-tribes, commanded by the Duca and his caciques, were assembled in the central community toward which they were heading, that grave danger of some sort threatened Naida, and that the need for haste was great. But what the danger was, the two girls could not understand.

“We can’t make out what is going to happen—what they plan to do to-night,” Ivana whispered at last to Kirby. “All Gori says is that we must rescue Naida and take her away, and must take the Duca away so that he cannot influence the men any more. And she keeps repeating that we must hurry.”

“And you can’t find out what we must rescue Naida *from*?”

Ivana shook her head.

“I’m afraid we’re facing something of an appalling

nature, as dangerous to ourselves as to Naida. But I know nothing more.”

By the time the silver glow which corresponded to moonlight flooded the jungle, Gori had left the open trail, and was leading them across country which humans could not have negotiated without the guidance she offered. Advancing cautiously always, she stopped for long seconds at a time to reconnoitre, shifting her huge ears about and changing their shape, twitching her nostrils, and glancing hither and thither with bright little eyes. Sometimes they passed immense spike-tipped flowers ten feet in diameter, with fleshy yellow leaves which gave out a nauseating stench. Vines with long, recurved thorns and blossoms of deep scarlet, laced the undergrowth together and made passing dangerous. Fire-flies drifted past, and all above and about them flapped moths as big as bats.

Kirby, his clothes almost torn from his body, sweat pouring from every pore, heard the labored breathing of the girls, and wondered how they could hang on. But they did, and after a long time, Gori, halting in

the midst of a slight clearing, held up a warning hand.

A queer sensation came over Kirby. As he stared and listened, he realized that the twinkles he saw far ahead were not fire-flies, as he had thought, but lights. In the frosted moon glow, Nini and Ivana drew close, and Kirby clasped their hands and pressed them for a second. Too tired to exult further he was, even though they seemed close to their goal of goals.

Gori swung her hairy arm in a signal, and with rifles clasped carefully, they began to advance. When, five minutes later, they stood in the heart of a rank glade beyond which they could see nothing, Gori spoke to the two girls in her creaking whisper, and Nini laid a restraining hand on Kirby's.

"We have gone as far as Gori dares! She says we must climb a tree here, and watch what will go on in a clearing just beyond this thicket."

"And we still don't know what we're getting into," Kirby muttered.

But at any rate they had reached the end of their march.

Exultation did come to Kirby now, but still he was too completely fagged, as were both girls, to give much sign. Gori pointed to a tree some fifty feet away, which shot up to a great, foliage-crowned height. They moved toward it, and in a moment were climbing, Gori first, the girls after her, and Kirby last.

“Here we are,” Ivana presently whispered, at the same time drawing herself out on a limb just beneath one on which Gori and Nini had crawled.

Kirby found himself hedged in by tasselled leaves through which he could not see. The foliage thinned, however, and soon Ivana halted, perched herself in a comfortable position. Kirby, making himself at ease beside her, and seeing that Nini and Gori were in place, turned his eyes slowly, expectantly downward.

At first, all that he saw from his bird’s-eye perch, was a circular clearing two hundred yards across, which was surrounded on all sides by lowering jungle. In the

exact center of the circle, like a splotch of ink on gray paper, there gaped a deep hole which might have measured six feet in diameter. Around this hole, eight poles as tall and stout as telephone poles stood up in bristling array. The moonlight showed that the whitish earth of the clearing was tamped smooth as though thousands of creatures had danced or walked about there for centuries. But not a living form was visible.

A grunt of disappointment escaped Kirby after that one look. When he looked beyond the clearing, however, a change came to his feelings.

A quarter of a mile away, lights were twinkling—the same ones which had been visible on the last stretch of the journey. And the moonlight touched the little conical roofs of fully two hundred huts of the ape-people. No sound was audible save the souging of night wind in the trees, the shrilling of insects.

Nevertheless, there stole over Kirby all at once a feeling that the great ape-village was crowded to overflowing. What was more, he felt himself touched by an eery sensation—familiar these days—of evil to come.

Ivana, seated with her rifle across her knees, stirred on the limb beside him.

“Oh,” she whispered suddenly, “I am afraid of this place!”

Kirby took her hand.

“I know. Maybe it is the sensation of all the legions of the apes herded together so silently in their village. I wish we knew what to expect from them. I wish—”

But he broke off, and called softly to Nini on the limb above. She looked down with a drawn expression about her mouth.

“Are you all right?” Kirby whispered.

“Yes. But—Well, are both of *you* all right? Gori says we have reached here in time, but I—” A gasp of uneasiness escaped her, and Kirby heard Ivana echo it. “There is something about that black, silent hole out there in the clearing, and about those poles sticking up like fangs, that makes me terribly, terribly

afraid. Oh, what are they planning? Where is Naida? What are they going to do to her?"

Kirby whistled in a low key. He had not thought about the black hole in the clearing.

"Hum," he muttered, "that's interesting. Ivana, Nini, what do you suppose—"

But he got no answer. Gori's twitching lips grimaced them to silence.

The next instant, the stillness of the night was hurled aside by a howling, gurgling shout from a hundred, a thousand hysterically distended ape throats. With the sickening sound came from the village the sullen roaring of drums.

Ten minutes later, a Kirby who was cold with apprehension and wonder looked down from his leaf-crowned height at such a spectacle as he knew human eyes had never before seen. The shouting had died away, the drums were silenced. Crammed into the clearing, their foul, hairy bodies packed close

together, the silver light glinting against rolling red eyes and grinning white teeth, stood fully a thousand apes!

Once the first tumult of shouting in the village had died, they had come on in silence, and in orderly procession. Those who bore the drums—huge gourds with heads of stretched skin—had formed a line entirely around the outer diameter of the circular clearing. Then others, lugging vats of a dark, heady-smelling liquor, had deposited their burden beside the drums, and formed a second circle. The balance of the thousand had crowded itself together as best it might, leaving bare the center of the clearing with its black hole and fangs of poles. Kirby, looking down at these legions, did not wonder that cold sweat wetted his back.

Capable of thinking about only one thing—Naida—he was trying with all his strength not to think. Ivana, her face blanched in the light which filtered their camouflage of leaves, sat rigid, her hands locked about her cold rifle. On the branch above, Nini and Gori were as still as mummies. No one had spoken

since the vanguard of apes had appeared.

But at last Nini leaned close to Kirby.

“Have you any idea of what all this means?”

A draught of hot night air carried up a stench of drunkenness, and the goatly odor of massed animal bodies.

“No,” Kirby whispered. “I suppose, from Gori’s having brought us here, that Naida is going to appear somehow. We’ve simply got to trust that Gori knows what she is about.”

“But listen—” Ivana suppressed a shudder. “Suppose they should bring Naida here presently to force her to take part in some ceremony at which we can only guess. Gori, who thinks we can work miracles, supposes we can rescue Naida. But I—I’m not so certain. Is there *anything* we can do?”

It was exactly that question which had made Kirby fight to keep himself from thinking. His face turned

gray before he answered. But answer he did, finally.

“Yes, there is one thing we can do, Ivana. We’ve got to be frank with each other, and so far, this is the *only* thing I’ve been able to figure out. If Naida is brought here, and they make any move to harm her or torture her, we can, and we will, shoot her quickly, before harm or pain comes.”

A grim silence settled once more. During the last miles of march in the jungle, there had persisted in Kirby’s heart the hope that there would be at least *something* favorable in whatever situation they might encounter. His spirits were so low now that he dared not speak again.

Amongst the noiseless sea of ape-men below them came, every now and again, a little ripple of motion as some anthropoid shadow fell out of his place, approached the liquor vats, and swilled down the black brew, a quart at a gulp. But mostly there was little commotion. Ivana drew a sibilant breath and said that she wished something would happen.

“I wish,” Kirby answered tensely, “that we knew *what* is going to happen.”

But the nightmare waiting was not to go on forever. Kirby leaned forward and pointed.

It was only instinct that had made him know action must come. For a second, no change in the expression of the ape-men, no movement in their crammed ranks, was visible. Then, however, a queer, subdued grunting rumbled deep down in many throats, and those who had faced the hundred-foot space in the center of the clearing squatted down on their hams.

In the back of the crowd necks were craned. The stronger shoved the weaker in an effort to get a better view of the cleared stage, and a few ape-men who had been drinking hurried on unsteady legs to their places.

“The drums!” Kirby whispered then.

With almost military precision, the scores of leather-faced creatures who had led the procession into the

clearing, clasped the skin-headed gourds to their shaggy bellies, and stood with free arm raised as though awaiting a signal. Nini moved in her position, and Kirby felt Ivana shiver and edge close to him.

From the front rank of the crowd, there sprang up a great male creature with the face of a gargoyle and the body of a jungle giant. Just once he reeled on his feet, as though black alcohol had befuddled him, then he steadied himself, flung both arms above his head, and rolled out a command which burst upon Kirby's ears like thunder.

It was as if the whole cavern of the lower world, and the whole of the round earth itself, had been rocked uneasily, dreadfully by the bellowing, crashing explosion of the drums. Maddened by the turmoil he had let loose, the gargoyle-faced giant ape-man leered about him with blood-shot, drunken eyes, and beat on his cicatrized chest with massive fists. Suddenly he let out a bellow. Straight up into the air he sprang in a wild leap. When he came down, he was dancing, and the portentous, the sickeningly mysterious ceremony for which such solemn

preparation had been made, was begun.

Kirby drew a rasping breath. Knowing that there must be some definite reason for the dance having begun just when and as it had, he looked beyond the solitary dancing giant, on beyond the crowded legions of the apes, toward the village. There, where the main trail from the community approached the clearing, he saw precisely the thing which he had both hoped desperately and dreaded terribly to find.

Headed directly toward the clearing, moving down the trail with slow, majestic pace, came a procession headed by a bodyguard of ape-men and augmented by other men whose nakedness was covered by unmistakable, unforgettable priestly robes of gray.

All at once the ape-people in the clearing began to scuffle apart, opening a lane down which the procession might pass to the central stage with its dancer, its ink spot orifice, and its fangs of tall poles. Kirby, watching the congregation, watching the majestic approach of gray robes through the night, wiped away from his forehead a sweat of fear.

“I think,” Nini called in a voice pitched high to outsound the drums, “that the—the Duca is with them!”

“Yes.” Kirby pointed jerkily. “In the middle of the procession, there, surrounded by his caciques!”

The Duca!

Yet his approach did not hold Kirby. Directly behind the priests were emerging now from the jungle a new company of ape-men. Squinting his eyes, Kirby saw that two of them were lugging on a pole across their shoulders a curious burden—a sort of monstrous bird cage of barked withes. Crouched on the floor of the cage in a little motionless, white heap—

But Kirby closed his eyes. Ivana, cowering against him, gulped as though she were going to be sick. Nini leaned down from above and looked at them with dilated eyes. Although none of them spoke, all knew that they had found Naida at last.

Kirby was the first to pull himself up. Opening his

eyes, he stared long at the white gowned, motionless shape within the cage. Next summing up the whole situation—the cage surrounded by an armed band, the clearing crammed with a thousand ape-men—he shook his head. Afterward, he made a quick movement with his hands.

Ivana, seeing that movement, seeing the expression on his face, started out of her daze.

“No! No! Oh, there must be some other way out for her! There must—”

Her cry, half a shriek, did not change Kirby’s look. What he had done with his hands was to throw a shell into the chamber of his rifle. Now he held the rifle grimly, ready to carry it to his shoulder.

The procession with the bodyguard of ape-men at its head, the renegade Duca and his caciques following next, and the cage bringing up the rear, advanced relentlessly down the lane to the central stage. The gargoyle-faced ape-man who held the stage alone danced with increasing wildness, writhing, twisting,

with weird suppleness. Upon the dancing giant the procession bore down, and before him it finally halted.

The halt left the Duca and the king ape facing each other, and the ape ended his dance. After each had given a salute made by raising their arms, both Duca and the king ape turned to face the creatures who were standing with the cage slung across their shoulders. Whereupon the bearers of the cage advanced with it until they stood between two of the tall poles. There, facing the ominous hole in the center of the clearing, with a pole on either side of them, the ape-men lowered the cage to the ground.

Kirby felt his last hope and courage ebbing. Now he noticed that each pole was equipped with a rope which passed through a hole near its top, like a thread through the eye of a needle. And while he stared at the dangling ropes, the ape-men made one end of each fast to a ring in the top of the cage. The next instant they leaped back, and began to heave at the other end of the lines.

From the drums came a quicker pounding, a more head-splitting volume of thunder. Over all the ape-people who watched the show, passed a shiver of what seemed to be whole-souled, ecstatic satisfaction. Slowly, as the two ape-men heaved hard, the cage swung off the ground, and slowly rose higher and higher into the moonlit air.

When finally the thing hung high above the heads of the multitude, swaying midway between its tall supports, the ape-men who had done the hoisting fastened their lines to cleats on the poles. Then they turned to the Duca and the giant king who stood behind them, executed a queer, lumbering bow, and fell back to the rear.

The next moment it seemed as though every creature in the clearing—men and those who were only half men—had gone crazy. The king flung himself into the air as if he were a mass of bounding rubber. Following his lead, the whole assembly let out howls that drowned even the drums, and then began to sway, to

squirm, to leap, even as their king was doing before them.

The caciques and the Duca joined in the madness of foul dancing as heartily as any there. Their eyes were flaming, their long robes flapping, their beards streaming.

On his perch in the tree Kirby muttered an oath which was lost, swept away like a breath, in the shrieking turmoil of sound. Then he turned to Ivana.

“They’ve brought Naida here to sacrifice her.”

“But *why*?” Ivana’s sweet face was frozen in lines of horror. “I’ve been able to guess what was going to happen to her. But—*sacrifice*. Why will it be that?”

“Don’t you see?” Looking up to include Nini, Kirby found his hands quivering against his rifle. “It is easy to understand. In the temple yesterday, what the Duca hoped to do was to kidnap most, or all, of the girls for the ape-people. But he was able to get only Naida. The first result was that the ape-men started to

quarrel over the one girl. From what Gori says, trouble started on all sides at once. It became inadvisable to let Naida live. So the Duca, in his shrewdness, planned a sacrifice. By sacrificing Naida, he rids himself of a source of contention amongst the ape-men. He also hopes his act will win favor from his Gods, and make them help him when he is ready to launch a new attempt to capture *all* the girls."

Ivana and Nini looked at each other, then at Kirby, and horror was etched deeper into their faces.

"I think," gulped Ivana, "that you—are right. I—begin to understand."

Nini leaned close to them.

"Tell us, then, *how* this sacrifice is to be made."

Silent at that, Kirby presently made a heavy gesture toward the maelstrom of howling, leaping animals below them.

"I couldn't guess at first. Now I think I can. They have

placed her in that cage and swung it high above the black hole you were afraid of. What can that mean except that she is to be offered to—to—”

It was a monstrous theory which had stunned his hope and courage, and to voice the thing in words was too gruesome.

His bare suggestion, however, made Ivana pass a hand limply over her forehead and look at him with blank, stricken eyes. Nini tottered so uncertainly that Gori, who had remained motionless and silent throughout, had to steady her with muscular arms. If it was impossible for Kirby to utter his fears aloud, he had no need to speak to make them understood.

“And—and we can do nothing?” Nini choked at last.

“You can see for yourself how she is surrounded. If we had been able to get here sooner, we might have done something. Now—”

Kirby’s voice trailed off, and he gave an agonized look at his rifle.

The terrific dance in the clearing was going forward with madness which increased second by second. It had been a general debauch at first, with the whole thousand of the apes bellowing and squirming. Now a change was becoming apparent. Red eyes which had caught the glare of ultimate madness, focused upon the caciques, the Duca, and the great king, all of whom were swaying together on the central stage. As they looked, the horde of ape-men broke loose with a heightened frenzy of noise and movement too overwhelming for Kirby to follow. He leaned forward, making an effort to see what actions of Duca and king could be so influencing the congregation. And then he saw.

Both of those central figures, the one with hair-covered giant's body and evilly grimacing face, the other with white robes and whipping silver hair, were definitely emulating the motions of a serpent!

It was as if the angles and joints had disappeared from their bodies. They were become gliding lengths of muscle as swift, as loathsome in their supple dartings and coilings as any snake lashing across the

expanses of primeval jungle. Lost in what they did, unconscious of the nightmare, demoniac legion before which they danced, they had eyes only for the empty, ominous hole beneath Naida's cage. As they circled the hole, drawing ever and ever closer to it, they opened and closed their arms with the motion of great serpent jaws biting and striking.

"God in Heaven!" Kirby cried in a voice which shrilled with horror and then broke.

It was not alone the Duca's dance which had wrung the shout from him. As Nina and Ivana shrieked and cowered, as Gori twitched, gasped, buried her head in trembling arms, Kirby knew that Naida was fully aware of what was going on—had been, perhaps, from the beginning.

Slowly, numbly she raised herself from her huddled position, rose to her knees, and clutching with despairing hands at the sides of her cage, looked out from between the bars.

The king and Duca edged closer to the hole until they

were dancing upon its very brink. From that position, they stared down into the depths, their faces tense and strained. And then their look became radiant, exalted, joyous. Suddenly the Duca leaped back. He shrieked something at the gargoyle ape, and they flung their arms high in a commanding, mighty signal which was directed across the nightmare legion of ape-men, to the drums.

As Kirby winced in expectancy, the drums ceased to roar. Over the night smashed a hideous concussion of silence, deafening, absolute. And the ape-men—all of them—and the Duca, his caciques, and the king, ceased to dance. As if a whirlwind had hurled them, the caciques scattered in all directions. The Duca, having already leaped back from the gaping orifice, suddenly turned and ran with blurred speed over to the slobbering, deadly still front rank of the congregation. An instant later the king crouched down beside him, and the whole stage was left bare and deserted.

Kirby gave one look at Naida, found her staring down, deeper and deeper down, into the hole which yawned

beneath her so blackly. Then Kirby lowered his eyes until he, too, stared at the opening.

Amidst the pressing silence there stole from the earth an uneasy sound as of some immense thing waking and stirring. Came a hissing note as of escaping steam. The tribes of the ape-men waited in silent rapture. Kirby saw Naida still looking down, and felt Ivana crouch against him, fainting. He held his rifle tighter, and continued to stare.

Something red, like two small flames, licked up above the edge of the pit. Then Kirby gasped and all but went limp. Up and out into the moonlight slid a glistening white lump that moved from side to side and licked at the night with flickering black and red tipped forked tongue.

The glistening white lump was the head of Quetzalcoatl, buried God of the People of the Temple. It was wider and bigger than an elephant's, and the round snake body could not have been encircled by a man's two arms. Kirby guessed at the probable length of the Serpent in terms of hundreds of feet.

Sick, numb, he glanced at Naida, who was still staring silently, and hitched his rifle half up to his shoulder. But he did not look down the sights yet. Although it was time, and more than time, that he fired, he would not do it until the last possible second, when nothing else remained.

Slowly from the hole slid a fifteen or twenty-foot column of the body, and Quetzalcoatl, thus reared, looked about him with a pair of eyes immense and not like snake's eyes, but heavily lidded and lashed; eyes that stared in a wise, evil way; eyes glittering and round and black as ink. After a time the mouth opened in a silent snarl, showing great white fangs and recurved simitars of teeth. The head was snow white, leperous in its scabby, scaly roughness, with here and there a patch of what looked like greenish fungus. From the rounded body trailed a short, unnatural, sickening growth of—feathers. Old and evil and very wise the Feathered Serpent seemed as his forked tongue flickered in and out and he stared at the ape horde, who stared back silently.

He seemed in no hurry to devote his attention to the

cage set forth for his delectation. The black eyes rolled beneath their lashes, staring now at the Duca in his robes, and again at the huddled ape-people. But after ghastly seconds, Quetzalcoatl at last had seen enough.

Again the moonlight glinted against simitar teeth as the great, white, puffy mouth yawned in its silent snarl. Quetzalcoatl reared his head a little higher, slid further from his hole, and then looked up at the dangling cage of barked withes.

In Kirby's mind stirred cloudily a remembrance of moments in the past: the feel of Naida's first kiss, her look as they advanced to the altar in the temple. Then he saw things as they were now, with Naida surrounded by all the tribes of the apes, and with Quetzalcoatl staring from beneath heavily lidded lashes at the whiteness of her.

Suddenly Kirby stirred to free his shoulder of Ivana's supine weight against it, and he made himself look down his rifle. He let the breath half out of his lungs, and nursed the trigger.

But he did not fire.

All at once he started so violently that he almost hurtled from the tree. Suddenly, trembling, he lowered his rifle.

“Oh, thank God!” he yelled in the silence of the night.

The idea which had transformed him was perhaps the conception of a lunatic. But it was still an idea, and offered a chance.

Again Kirby peered down his rifle. But he no longer aimed at Naida. As Quetzalcoatl lifted white fangs, Kirby aimed deliberately at him, and turned loose his fire.

With the first shot, the Serpent lurched back from the cage, snapped his jaws, and closed evil, black eyes. From one lidded socket squirted dark blood. As a second and third shot crashed into the cavernous fanged mouth, and others ripped into the flat skull, Quetzalcoatl seemed dazed. His head wavered back and forth and his hiss filled the night, but he did

nothing.

But all at once Kirby felt that he was *going* to do something in a second, and a great calm came upon him. He quickly jammed home a fresh clip of shells.

“Nini! Ivana! Fire at the Serpent. Give him everything you’ve got! Do you understand? Fire! He thinks that the ape-people have hurt him, and he will be after them in a second. If we have any luck, he will do to them what we never could have done, and maybe destroy himself at the same time! Me, I’m going down there and get Naida now!”

Chapter 13

No sooner did Kirby see comprehension in the girls' faces than he swung around and let go of his perch. As he crashed, caught the next limb below him, and let go to crash to another, he had all he could do to suppress a yelp of joy. For all at once every voice in the ape congregation was raised in howls and screams of devastated terror.

He did not care how he got down from the tree. Seconds and half seconds were what counted. From the last limb above the ground he swung into space, and a split second later staggered to his feet, clutched his rifle, and started for the clearing. His lungs seemed collapsed and both ankles shattered. He did not care. Not when the ape screams were growing louder with every step he took. Not when he heard Nini and Ivana pouring down from their tree a continuation of the scorching fire he had started.

Panting, his breath only half regained, but steeled to make the fight of his life, he tore from the jungle into the clearing just in time to see a twisting, pain-

convulsed seventy-foot coil of white muscle lash up and strike Naida's cage a blow which knocked it like a ball in the air. Naida screamed and hung to the bars.

But she was all right. It was not against her that Quetzalcoatl was venting his wrath: the blow had been blind accident. As Kirby stood at the clearing's edge, he knew to a certainty that Quetzalcoatl's reaction to sudden pain had been all he had dared hope.

In front of him forty or fifty ape-bodies lay in a crushed heap. While yard after yard of the Serpent's bleached length streamed out of the hole, the hundreds of feet of coils already in the clearing suddenly whipped about a whole squadron of apemen, and with a few constrictions annihilated them as if they had been ants. Across the clearing, the leperous head reared up as high as the trees and swooped down, fangs gleaming. The howls of the apemen trying to flee, the screams of those who had been caught, rose until they became all one scream.

But Kirby had not left the safety of the tree merely to

get a ringside view of carnage. He faced his next, his final task unhesitatingly. Straight out he leaped from the shadows of the jungle into the clearing, out into the presence of the beleagured, screaming ape-men. Well enough he knew that those creatures, despite their frenzy, might sight him and fall upon him at any second; well enough he knew that a single flick of the white coils all over the clearing could crush him instantly. But the time to worry about those hazards would be when they beset him. With a yell as piercing as any in the whole bedlam, Kirby rushed forward.

High up in the moonlit vault of the night, swaying between the two poles which supported it, hung the white cage which was Naida's prison. By the time Kirby had sprinted fifty yards, he knew that his yells had reached Naida. For she staggered to her knees and looked straight at him. A second later, though, he realized that the almost inevitable recognition of him by ape-men had come to pass.

Eight or ten of the creatures, left unmolested for a second by the Serpent, halted in the mad run they were making for the sheltering jungle, and while one

pointed with hairy arm, the others let out shrieks. Kirby gritted his teeth in something like despair. Then he realized that the worst danger—Quetzalcoatl's blurred coils—was not threatening him so far. And he went on, straight toward the ape-men.

He did not look where, how, or at whom he struck. All he knew was that his rifle blazed, and as he clubbed at soft flesh with the butt, blood spurted, and new screams filled the night. He felt and half saw big, stinking bodies going down, and clawed his way forward, around them, over them. Then he felt no more bodies, and knew that he was through. A little farther he ran over the trampled earth, and stopped and looked up.

The howls of the living, the shrieks of the dying deafened him. Renewed shots from the rifles in the tree, made the Serpent lash about in a dazzling white blur, smashing trees, apes, everything in its path. But Kirby, finding himself still safe, scarcely heard or saw. His eyes, turned upward, saw one thing only.

“Naida!”

She had snapped two of the withes of the cage and was leaning forward through the opening. Her face was livid with horror and exhaustion, but she was able to look at him with eyes that glowed.

“You—you came!” she gasped. “You came to me!”

In a flash Kirby jumped over to the poles and began to cast off one of the lines which held the cage aloft.

“Get ready for a bump!” he shouted, as he lowered away, arms straining.

Paying out the one line left the cage suspended from the second, but let it sweep from its position between the poles, down toward one pole. As the thing struck the tall support, Kirby bounded over to stand beneath it, only too sharply aware of the death waiting for him on every side, but ignoring it. Naida still hung suspended a good twenty feet above him, but there was no time to let go the other line. He braced himself and held up his arms.

“Jump!” he yelled.

Then he saw the white gown sweeping down toward him, felt the crash of a soft body against his, and staggered back. Recovered in a tenth of a second, he drew a deep breath, and looked at Naida beside him, tall and brave, unhurt.

“Are you able to run?” he snapped, and then, the moment she nodded, motioned toward the jungle.

Behind them, in front, on all sides, rose screams so horrible that he wondered even then if he would ever forget. As he started to run, he realized that when Naida had finally landed in his arms, the nearest squirming loop of the Serpent had been no more than four yards away, and that, right now, if their luck failed, a single unfortunate twist of the incredible hundreds of feet of white muscle could still end things for them.

But luck was not going to fail. Somehow Kirby knew it as they sprinted side by side, and the sheltering jungle loomed closer every second. And a moment later, something beside his own inner faith made him know it, too.

“Look, Naida! Look!” he screeched all at once.

At the upper end of the clearing, where an unthinkable slaughter was going on, there leaped out from amongst a surging mass of apes, leaped out from almost directly beneath a downward smashing blur of white snake folds, a figure which Kirby had not seen or thought about for many seconds.

The Duca’s robe hung in tatters from his body. Blood had smeared his white hair. His eyes were those of a man gone mad from fear. And as he escaped the tons of muscle which so nearly had engulfed him, he began to run even as Kirby felt himself running.

Straight toward him and Naida, Kirby saw the man spurt, but whether the mad eyes recognized them or not, he could not tell, nor did he care. All at once his feeling that they would escape the clearing, became conviction.

For suddenly the same single twitch of Quetzalcoatl’s vast folds which might have finished them, if luck had not held, put an end to the Duca’s retreat. At one

moment the man's path was clear. The next—

Kirby, running for dear life, gasped, and heard Naida cry out beside him.

The great loops flashed, twisted, and where had been an open way for the Duca, loomed a wall of scaly white flesh. The living wall twitched, closed in; and as the Duca dodged and leaped to no avail, a cry shrilled across the night—a cry that cut like a knife.

Kirby saw no more. But it was likely that most, if not all, of the caciques had gone with the Duca.

Somehow, anyhow, in but a few seconds more, Kirby dove into the spot from which he had left the jungle to enter the clearing. As Naida pressed against him, winded but still strong, he found his best hopes for immediate retreat realized, for Gori, Nini, and Ivana, down from their tree, ran toward them.

“She is all right,” he said with a gesture which cut short the outbursts ready to come. “But we’ve got to keep going. Ivana, tell Gori that her people are gone,

wiped out, but that if she will cast her lot with us, we will not forget what she has done. Come on!”

With Gori leading them they ran, stumbling, recovering themselves, stumbling again. To breathe became an agony. But not until many minutes later, when they plowed into the cover of a fern belt whose blackness not even the moonlight had pierced, did Kirby call a halt.

Here he swept a final glance behind him, listened long for sounds of pursuit, and relaxed a little only when none came to disturb the night stillness. However, that relaxation, now that he permitted it at last, meant something.

The complete silence gave him final conviction that what he had said about the whole ape-people being destroyed was true. As for the Serpent—well, perhaps he was destroyed even as they were. Perhaps not. In any case the grip which Quetzalcoatl held upon the imagination of the People of the Temple had been destroyed by this night’s work, and that was what counted most. The Serpent would be worshipped no

longer.

Kirby reached out in the darkness and found Naida's hand.

"Come along," he said to all of the party. "I think the past is—the past. And with Gori to guide us out of the jungle, and our own brains to guide us through the jungle of self-government after that, I think the future ought to be bright enough."

Ivana and Nini both chuckled as they moved again, and Gori, hearing her name spoken in a kindly voice, twitched her ears appreciatively. Naida drew very close to Kirby.

"What are you thinking about?" she asked presently.

"The—temple," he answered.

"About the crown which probably is still lying on the altar there?"

Kirby looked up in surprise.

“Why, I had forgotten about that!”

“What was it, then?”

“But what could I have been thinking about except how you looked when we came together in that gloomy place, and walked forward, side by side? *Now* have I told you enough?”

Naida laughed.

“There is so much to be done!” Kirby exclaimed then. “As soon as possible, we must climb to the Valley of the Geyser, go on into the outer world, and there seek carefully for men who are willing, and fit, to come here. And that is only one task. Others come crowding to me every second. But first—”

“What?” Naida asked softly.

“The temple. Naida, we will reach the plateau sometime to-morrow. All of the girls who kept watch there will be waiting for us, and it will be a time of happiness. May we not, then, go to the temple? There

will be no priests. But we will make our pledges without them. Tell me, may I hope that it will be so—to-morrow?"

Naida did not answer at once. She did not even nod. But presently her shoulder, still fragrant with faint perfume, brushed his. She clasped his hand then, and as they walked on in silence, Kirby knew.

January 1931

#64 The Dark Side Of Antri, By Sewell Peaslee Wright:

Commander John Hanson relates an interplanetary adventure illustrating the splendid service spirit of the men of the special patrol.

Aproximate word count:

Bigotry:

Warnings:

- - -

An officer of the Special Patrol Service dropped in to see me the other day. He was a young fellow, very sure of himself, and very kindly towards an old man.

He was doing a monograph, he said, for his own amusement, upon the early forms of our present offensive and defensive weapons. Could I tell him about the first Deuber spheres and the earlier disintegrator rays and the crude atomic bombs we

tried back when I first entered the Service?

I could, of course. And I did. But a man's memory does not improve in the course of a century of Earth years. Our scientists have not been able to keep a man's brain as fresh as his body, despite all their vaunted progress. There is a lot these deep thinkers, in their great laboratories, don't know. The whole universe gives them the credit for what's been done, yet the men of action who carried out the ideas—but I'm getting away from my pert young officer.

He listened to me with interest and toleration. Now and then he helped me out, when my memory failed me on some little detail. He seemed to have a very fair theoretical knowledge of the subject.

"It seems impossible," he commented, when we had gone over the ground he had outlined, "that the Service could have done its work with such crude and undeveloped weapons, does it not?" He smiled in a superior sort of way, as though to imply we had probably done the best we could, under the circumstances.

I suppose I should not have permitted his attitude to irritate me, but I am an old man, and my life has not been an easy one.

“Youngster,” I said—like many old people, I prefer spoken conversation—“back in those days the Service was handicapped in every way. We lacked weapons, we lacked instruments, we lacked popular support, and backing. But we had men, in those days, who did their work with the tools that were at hand. And we did it well.”

“Yes, sir!” the youngster said hastily—after all, a retired commander in the Special Patrol Service does rate a certain amount of respect, even from these perky youngsters—“I know that, sir. It was the efforts of men like yourself who gave us the proud traditions we have to-day.”

“Well, that’s hardly true,” I corrected him. “I’m not quite so old as that. We had a fine set of traditions when I entered the Service, son. But we did our share to carry them on, I’ll grant you that.”

“‘Nothing Less than Complete Success,’” quoted the lad almost reverently, giving the ancient motto of our service. “That is a fine tradition for a body of men to aspire to, sir.”

“True. True.” The ring in the boy’s voice brought memories flocking. It was a proud motto; as old as I am, the words bring a thrill even now, a thrill comparable only with that which comes from seeing old Earth swell up out of the darkness of space after days of outer emptiness. Old Earth, with her wispy white clouds and her broad seas— Oh, I know I’m provincial, but that is another thing that must be forgiven an old man.

“I imagine, sir,” said the young officer, “that you could tell many a strange story of the Service, and the sacrifices men have made to keep that motto the proud boast it is to-day.”

“Yes,” I told him. “I could do that. I have done so. That is my occupation, now that I have been retired from active service. I—”

“You are a historian?” he broke in eagerly.

I forgave him the interruption. I can still remember my own rather impetuous youth.

“Do I look like a historian?” I think I smiled as I asked him the question, and held out my hands to him. Big brown hands they are, hardened with work, stained and drawn from old acid burns, and the bite of blue electric fire. In my day we worked with crude tools indeed; tools that left their mark upon the workman.

“No. But—”

I waved the explanation aside.

“Historians deal with facts, with accomplishments, with dates and places and the names of great men. I write—what little I do write—of men and high adventures, so that in this time of softness and easy living some few who may read my scribblings may live with me those days when the worlds of the universe were strange to each other, and there were many new things to be found and marveled at.”

“And I’ll venture, sir, that you find much enjoyment in the work,” commented the youngster with a degree of perception with which I had not credited him.

“True. As I write, forgotten faces peer at me through the mists of the years, and strong, friendly voices call to me from out of the past....”

“It must be wonderful to live the old adventures through again,” said the young officer hastily. Youth is always afraid of sentiment in old people. Why this should be, I do not know. But it is so.

The lad—I wish I had made a note of his name; I predict a future for him in the Service—left me alone, then, with the thoughts he had stirred up in my mind.

Old faces ... old voices. Old scenes, too.

Strange worlds, strange peoples. A hundred, a thousand different tongues. Men that came only to my knee, and men that towered ten feet above my head. Creatures—possessed of all the attributes of men except physical form—that belonged only in the

nightmare realms of sleep.

An old man's most treasured possessions: his memories. A face drew close out of the flocking recollections; the face of a man I had known and loved more than a brother so many years—dear God, how many years—ago.

Anderson Croy. Search all the voluminous records of the bearded historians, and you will not find his name. No great figure of history was this friend of mine; just an obscure officer on an obscure ship of the Special Patrol Service.

And yet there is a people who owe to him their very existence.

I wonder if they have forgotten him? It would not surprise me.

The memory of the universe is not a reliable thing.

Anderson Croy was, like most of the officer personnel of the Special Patrol Service, a native of Earth.

They had tried to make a stoop-shouldered dabbler in formulas out of him, but he was not the stuff from which good scientists are moulded. He was young, when I first knew him, and strong; he had mild blue eyes and a quick smile. And he had a fine, steely courage that a man could love.

I was in command, then, of the *Ertak*, my second ship. I inherited Anderson Croy with the ship, and I liked him from the first time I laid eyes upon him.

As I recall it, we worked together on the *Ertak* for nearly two years, Earth time. We went through some tight places together. I remember our experience, shortly after I took over the *Ertak*, on the monstrous planet Callor, whose tiny, gentle people were attacked by strange, vapid Things that come down upon them from the fastness of the polar cap, and—

But I wander from the story I wish to tell here. An old man's mind is a weak and weary thing that totters and weaves from side to side; like a worn-out ship, it is hard to keep on a straight course.

We were out on one of those long, monotonous patrols, skirting the outer boundaries of the known universe, that were, at that time, before the building of all the many stations we have to-day a dreaded part of the Special Patrol Service routine.

Not once had we landed to stretch our legs. Slowing up to atmospheric speed took time, and we were on a schedule that allowed for no waste of even minutes. We approached the various worlds only close enough to report, and to receive an assurance that all was well. A dog's life, but part of the game.

My log showed nearly a hundred "All's well" reports, as I remember it, when we slid up to Antri, which was, so far as size is concerned, one of our smallest ports o' call.

Antri, I might add, for the benefit of those who have forgotten their maps of the universe, is a satellite of A-411, which, in turn, is one of the largest bodies of the universe, and both uninhabited and uninhabitable. Antri is somewhat larger than the moon, Earth's satellite, and considerably farther from its controlling

body.

“Report our presence, Mr. Croy,” I ordered wearily.

“And please ask Mr. Correy to keep a sharp watch on the attraction meter.” These huge bodies such as A-411 are not pleasant companions at space speeds. A few minute’s trouble—space ships gave trouble, in those days—and you melted like a drop of solder when you struck the atmospheric belt.

“Yes, sir!” There never was a crisper young officer than Croy.

I bent over my tables, working out our position and charting our course for the next period. In a few seconds Croy was back, his blue eyes gleaming.

“Sir, an emergency is reported on Antri. We are to make all possible speed, to Oreo, their governing city. I gather that it is very important.”

“Very well, Mr. Croy.” I can’t say the news was unwelcome. Monotony kills young men. “Have the disintegrator ray generators inspected and tested.

Turn out the watch below in such time that we may have all hands on duty when we arrive. If there is an emergency, we shall be prepared for it. I shall be with Mr. Correy in the navigating room; if there are any further communications, relay them to me there."

I hurried up to the navigating room, and gave Correy his orders.

"Do not reduce speed until it is absolutely necessary," I concluded. "We have an emergency call from Antri, and minutes may be important. How long do you make it to Oreo?"

"About an hour to the atmosphere; say an hour more to set down in the city. I believe that's about right, sir."

I nodded, frowning at the twin charts, with their softly glowing lights, and turned to the television disc, picking up Antri without difficulty.

Of course, back in those days we had the huge and cumbersome discs, their faces shielded by a hood,

that would be suitable only for museum pieces now. But they did their work very well, and I searched Antri carefully, at varying ranges, for any sign of disturbances. I found none.

The dark portion, of course, I could not penetrate. Antri has one portion of its face that is turned forever from its sun, and one half that is bathed in perpetual light. The long twilight zone was uninhabited, for the people of Antri are a sun-loving race, and their cities and villages appeared only in the bright areas of perpetual sunlight.

Just as we reduced to atmospheric speed, Croy sent up a message

“The Governing Council sends word that we are to set down on the platform atop the Hall of Government, the large, square white building in the center of the city. They say we will have no difficulty in locating it.”

I thanked him and ordered him to stand by for further messages, if any, and picked up the far-flung city of Oreo in my television disc.

There was no mistaking the building Croy had mentioned. It stood out from the city around it, cool and white, its mighty columns glistening like crystal in the sun. I could even make out the landing platform, slightly elevated above the roof on spidery arches of silvery metal.

We sped straight for the city at just a fraction of space speed, but the hand of the surface temperature gauge crept slowly toward the red line that marked the dangerous incandescent point. I saw that Correy, like the good navigating officer he was, was watching the gauge as closely as myself, and hence said nothing. We both knew that the Antrians would not have sent a call for help to a ship of the Special Patrol Service if there had not been a real emergency.

Correy had made a good guess in saying that it would take about an hour, after entering the gaseous envelope of Antri, to reach our destination. It was just a few minutes—Earth time, of course—less than that when we settled gently onto the landing platform.

A group of six or seven Antrians, dignified old men,

wearing the short, loosely belted white robes that we found were their universal costume, were waiting for us at the exit of the *Ertak*, whose sleek, smooth sides were glowing dull red.

“You have hastened, and that is well, sirs,” said the spokesman of the committee. “You find Antri in dire need.” He spoke in the universal language, and spoke it softly and perfectly. “But you will pardon me for greeting you with that which is, of necessity, uppermost in my mind, and in the minds of these, my companions.

“Permit me to welcome you to Antri, and to introduce those who extend those greetings.” Rapidly, he ran through a list of names, and each of the men bowed gravely in acknowledgment of our greetings. I have never observed a more courteous nor a more courtly people than the Antrians; their manners are as beautiful as their faces.

Last of all, their spokesman introduced himself. Bori Tulber, he was called, and he had the honor of being master of the Council—the chief executive of Antri.

When the introductions had been completed, the committee led our little party to a small, cylindrical elevator which dropped us, swiftly and silently, on a cushion of air, to the street level of the great building. Across a wide, gleaming corridor our conductors led us, and stood aside before a massive portal through which ten men might have walked abreast.

We found ourselves in a great chamber with a vaulted ceiling of bright, gleaming metal. At the far end of the room was an elevated rostrum, flanked on either side by huge, intricate masses of statuary, of some creamy, translucent stone that glowed as with some inner light. Semicircular rows of seats, each with its carved desk, surmounted by numerous electrical controls, occupied all the floor space. None of the seats was occupied.

“We have excused the Council from our preliminary deliberations,” explained Bori Tulber, “because such a large body is unwieldy. My companions and myself represent the executive heads of the various departments of the Council, and we are empowered to act.” He led us through the great council chamber,

and into an anteroom, beautifully decorated, and furnished with exceedingly comfortable chairs.

“Be seated, sirs,” the Master of the Council suggested. We obeyed silently, and Bori Tulber stood before, gazing thoughtfully into space.

“I do not know just where to begin,” he said slowly. “You men in uniform know, I presume, but little of this world of ours. I presume I had best begin far back.

“Since you are navigators of space, undoubtedly, you are acquainted with the fact that Antri is a world divided into two parts; one of perpetual night, and the other of perpetual day, due to the fact that Antri revolves but once upon its axis during the course of its circuit of its sun, thus presenting always the same face to our luminary.

“We have no day and night, such as obtain on other spheres. There are no set hours for working nor for sleeping nor for pleasure. The measure of a man’s work is the measure of his ambition, or his strength, or his desire. It is so also with his sleep and with his

pleasures. It is—it has been—a very pleasant arrangement.

“Ours is a fertile country, and our people live very long and very happily with little effort. We have believed that ours was the nearest of all the worlds to the ideal; that nothing could disturb the peace and happiness of our people. We were mistaken.

“There is a dark side to Antri. A side upon which the sun never has shone. A dismal place of gloom, which is like the night upon other worlds.

“No Antrian has, to our knowledge, ever penetrated this part of Antri, and lived to tell of his experience. We do not even till the land close to the twilight zone. Why should we, when we have so much fine land upon which the sun shines bright and fair always, save for the two brief seasons of rain?

“We have never given thought to what might be on the dark face of Antri. Darkness and night are things unknown to us; we know of them only from the knowledge which has come to us from other worlds.

And now—now we have been brought face to face with a terrible danger which comes to us from that other side of this sphere.

“A people have grown there. A terrible people that I shall not try to describe to you. They threaten us with slavery, with extinction. Four ara ago (the Antrians have their own system of reckoning time, just as we have on Earth, instead of using the universal system, based upon the enaro. An ara corresponds to about fifty hours, Earth time.) we did not know that such a people existed. Now their shadow is upon all our beautifully sunny country, and unless you can aid us, before other help can reach us, I am convinced that Antri is doomed!”

For a moment not one of us spoke. We sat there, staring at the old man who had just ceased speaking.

Only a man ripened and seasoned with the passing of years could have stood there before us and uttered, so quietly and solemnly, words such as had just come from his lips. Only in his eyes could we catch a glimpse of the torment which gripped his soul.

“Sir,” I said, and have never felt younger than at that moment, when I tried to frame some assurance to this splendid old man who had turned to me and my youthful crew for succor, “we shall do what it lies within our power to do. But tell us more of this danger which threatens.

“I am no man of science, and yet I cannot see how men could live in a land never reached by the sun. There would be no heat, no vegetation. Is that not so?”

“Would that it were!” replied the Master of the Council, bitterly. “What you say would be indeed the truth, were it not for the great river and seas of our sunny Antri, which bear their heated waters to this dark portion of our world, and make it habitable.

“And as for this danger, there is little to be said. At some time, men of our country, men who fish, or venture upon the water in commerce, have been borne, all unwillingly, across the shadowy twilight zone and into the land of darkness. They did not come back, but they were found there and despoiled of

their menores.

“Somehow, these creatures who dwell in darkness determined the use of the menore, and now that they have resolved that they shall rule all this sphere, they have been able to make their threat clear to us.

Perhaps”—and Bori Tulber smiled faintly and terribly —“you would like to have that message direct from its bearer?”

“Is that possible, sir?” I asked eagerly, glancing around the room. “How—”

“Come with me,” said the Master of the Council gently. “Alone—for too many near him excites this terrible messenger. You have your menore?”

“No. I had not thought there would be need of it.” The menores of those days, it should be remembered, were heavy, cumbersome circlets that were worn upon the head like a sort of crown, and one did not go so equipped unless in real need of the device. To-day, of course, your menores are but jeweled trinkets that convey thought a score of times more effectively, and

weigh but a tenth as much.

“It is a lack easily remedied.” Bori Tulber excused himself with a little bow and hurried out into the great council chamber, to appear again in a moment with a menore in either hand.

“Now, if your companions and mine will excuse us for a moment....” He smiled around the seated group apologetically. There was a murmur of assent, and the old man opened a door in the other side of the room.

“It is not far,” he said. “I will go first, and show you the way.”

He led me quickly down a long, narrow corridor to a pair of steep stairs that circled far down into the very foundation of the building. The walls of the corridor and the stairs were without windows, but were as bright as noonday from the ethon tubes which were set into both ceiling and walls.

Silently we circled our way down the spiral stairs, and silently the Master of the Council paused before a

door at the bottom—a door of dull red metal.

“This is the keeping place of those who come before the Council charged with wrong doing,” explained Bori Tulber. His fingers rested upon and pressed certain of a ring of small white buttons in the face of the door, and it opened swiftly and noiselessly. We entered, and the door closed behind us with a soft thud.

“Behold one of those who live in the darkness,” said the Master of the Council grimly. “Do not put on the menore until you have a grip upon yourself: I would not have him know how greatly he disturbs us.”

I nodded, dumbly, holding the heavy menore dangling in my hand.

I have said that I have beheld strange worlds and strange people in my life, and it is true that I have. I have seen the headless people of that red world Iralo, the ant people, the dragon-fly people, the terrible carnivorous trees of L-472, and the pointed heads of a people who live upon a world which may not be

named. But I have still to see a more terrible creature than that which lay before me now.

He—or it—was reclining upon the floor, for the reason that he could not have stood. No room save one with a vaulted ceiling such as the great council chamber, could offer room enough for this creature to walk erect.

He was, roughly, a shade better than twice my height, yet I believe he would have weighed but little more. You have seen rank weeds that have grown up in the darkness to reach the sun; if you can imagine a man who had done likewise, you can, perhaps, picture that which I saw before me.

His legs at the thigh were no larger than my arm, and his arms were but half the size of my wrist, and jointed twice instead of but once. He wore a careless garment of some dirty yellow, shaggy hide, and his skin, revealed on feet and arms and face, was a terrible, bloodless white; the dead white of a fish's belly. Maggot white. The white of something that had never known the sun.

The head was small and round, with features that were a caricature of man's. His ears were huge, and had the power of movement, for they cocked forward as we entered the room. The nose was not prominently arched, but the nostrils were wide, and very thin, as was his mouth, which was faintly tinged with dusky blue, instead of healthy red. At one time his eyes had been nearly round, and, in proportion, very large. Now they were but shadowy pockets, mercifully covered by shrunken, wrinkled lids that twitched but did not lift.

He moved as we entered, and from a reclining position, propped up on the double elbows of one spidery arm, he changed to a sitting position that brought his head nearly to the ceiling. He smiled sickeningly, and a queer, sibilant whispering came from the bluish lips.

"That is his way of talking," explained Bori Tulber. "His eyes, you will note, have been gouged out. They cannot stand the light; they prepared their messenger carefully for his work, you'll see."

He placed his menore upon his head, and motioned me to do likewise. The creature searched the floor with one white, leathery hand, and finally located his menore, which he adjusted clumsily.

“You will have to be very attentive,” explained my companion. “He expresses himself in terms of pictures only, of course, and his is not a highly developed mind. I shall try to get him to go over the entire story for us again, if I can make him understand. Emanate nothing yourself; he is easily confused.”

I nodded silently, my eyes fixed with a sort of fascination upon the creature from the darkness, and waited.

Back on the *Ertak* again. I called all my officers together for a conference.

“Gentlemen,” I said, “we are confronted with a problem of such gravity that I doubt my ability to describe it clearly.

“Briefly, this civilized, beautiful portion of Antri is menaced by a terrible fate. In the dark portion of this unhappy world there live a people who have the lust of conquest in their hearts—and the means at hand with which to wreck this world of perpetual sunlight.

“I have the ultimatum of this people direct from their messenger. They want a terrible tribute in the form of slaves. These slaves would have to live in perpetual darkness, and wait upon the whims of the most monstrous beings these eyes of mine have ever seen. And the number of slaves demanded would—as nearly as I could gather, mean about a third of the entire population. Further tribute in the form of sufficient food to support these slaves is also demanded.”

“But, in God’s name, sir,” burst forth Croy, his eyes blazing, “by what means do they, propose to inforce their infamous demands?”

“By the power of darkness—and a terrible cataclysm. Their wise men—and it would seem that some of them are not unversed in science—have discovered a way to unbalance this world, so that they can cause

darkness to creep over this land that has never known it. And as darkness advances, these people of the sun will be utterly helpless before a race that loves darkness, and can see in it like cats. That, gentlemen, is that fate which confronts this world of Antri!”

There was a ghastly silence for a moment, and then Croy, always impetuous, spoke up again.

“How do they propose to do this thing sir?”, he asked hoarsely.

“With devilish simplicity. They have a great canal dug nearly to the great polar cap of ice. Should they complete it, the hot waters of their seas will be liberated upon this vast ice field, and the warm waters will melt it quickly. If you have not forgotten your lessons, gentlemen, you will remember, since most of you are of Earth, that our scientists tell us our own world turned over in much this same fashion, from natural means, and established for itself new poles. Is that not true?”

Grave, almost frightened nods travelled around the

little semicircle of white, thoughtful faces.

“And is there nothing, sir, that we can do?” asked Kincaide, my second officer, in an awed whisper.

“That is the purpose of this conclave: to determine what may be done. We have our bombs and our rays, it is true, but what is the power of this one ship against the people of half a world? And such a people!” I shuddered, despite myself, at the memory of that grinning creature in the cell far below the floor of the council chamber. “This city, and its thousands, we might save, it is true—but not the whole half of this world. And that is the task the Council and its Master have set before us.”

“Would it be possible to frighten them?” asked Croy. “I gather that they are not an advanced race. Perhaps a show of power—the rays—the atomic pistol—bombs — Call it strategy, sir, or just plain bluff. It seems the only chance.”

“You have heard the suggestion, gentlemen,” I said. “Has anyone a better?”

“How does Mr. Croy plan to frighten these people of the darkness?” asked Kincaide, who was always practical.

“By going to their country, in this ship, and then letting events take their course,” replied Croy promptly. “Details will have to be settled on the spot, as I see it.”

“I believe Mr. Croy is right,” I decided. “The messenger of these people must be returned to his own kind; the sooner the better. He has given me a mental map of his country; I believe that it will be possible for me to locate the principal city, in which his ruler lives. We will take him there, and then—may God aid us gentlemen.”

“Amen,” nodded Croy, and the echo of the word ran from lip to lip like the prayer it was. “When do we start?”

I hesitated for just an instant.

“Now,” I brought forth crisply. “Immediately. We are

gambling with the fate of a world, a fine and happy people. Let us throw the dice quickly, for the strain of waiting will not help us. Is that as you would wish it, gentlemen?"

"It is, sir!" came the grave chorus.

"Very well. Mr. Croy, please report with a detail of ten men, to Bori Tulber, and tell him of our decision. Bring the messenger back with you. The rest of you, gentlemen, to your stations. Make any preparations you may think advisable. Be sure that every available exterior light is in readiness. Let me be notified the moment the messenger is on board and we are ready to take off. Thank you, gentlemen!"

I hastened to my quarters and brought the *Ertak's* log down to the minute, explaining in detail the course of action we had decided upon, and the reasons for it. I knew, as did all the *Ertak's* officers who had saluted so crisply, and so coolly gone about the business of carrying out my orders, that we would return from our trip to the dark side of Antri triumphant or—not at all.

Even in these soft days, men still respect the stern, proud motto of our service: "Nothing Less Than Complete Success." The Special Patrol does what it is ordered to do, or no man returns to present excuses. That is a tradition to bring tears of pride to the eyes of even an old man, in whose hands there is strength only for the wielding of a pen. And I was young, in those days.

It was perhaps a quarter of an hour when word came from the navigating room that the messenger was aboard, and we were ready to depart. I closed the log, wondering, I remember, if I would ever make another entry therein, and, if not, whether the words I had just inscribed would ever see the light of day. The love of life is strong in men so young. Then I hurried to the navigating room and took charge.

Bori Tulber had furnished me with large scale maps of the daylight portion of Antri. From the information conveyed to me by the messenger of the people of darkness—the Chisee they called themselves, as nearly as I could get the sound—I rapidly sketched in the map of the other side of Antri, locating their

principal city with a small black circle.

Realising that the location of the city we sought was only approximate, we did not bother to work out exact bearings. We set the *Ertak* on her course at a height of only a few thousand feet, and set out at low atmospheric speed, anxiously watching for the dim line of shadow that marked the twilight zone, and the beginning of what promised to be the last mission of the *Ertak* and every man she carried within her smooth, gleaming body.

“Twilight zone in view, sir,” reported Croy at length.

“Thank you, Mr. Croy. Have all the exterior lights and searchlights turned on. Speed and course as at present, for the time being.”

I picked up the twilight zone without difficulty in the television disc, and at full power examined the terrain.

The rich crops that fairly burst from the earth of the sunlit portion of Antri were not to be observed here.

The Antrians made no effort to till this ground, and I doubt that it would have been profitable to do so, even had they wished to come so close to the darkness they hated.

The ground seemed dank, and great dark slugs moved heavily upon its greasy surface. Here and there strange pale growths grew in patches—twisted, spotted growths that seemed somehow unhealthy and poisonous.

I searched the country ahead, pressing further and further into the line of darkness that was swiftly approaching. As the light of the sun faded, our monstrous searchlights cut into the gloom ahead, their great beams slashing the shadows.

In the dark country I had expected to find little if any vegetable growth. Instead, I found that it was a veritable jungle through which even our searchlight rays could not pass.

How tall the growths of this jungle might be, I could not tell, yet I had the feeling that they were tall

indeed. They were not trees, these pale, weedy arms that reached towards the dark sky. They were soft and pulpy, and without leaves; just long naked sickly arms that divided and subdivided and ended in little smooth stumps like amputated limbs.

That there was some kind of activity within the shelter of this weird jungle, was evident enough, for I could catch glimpses, now and then of moving things. But what they might be, even the searching eye of the television disc could not determine.

One of our searchlight beams, waving through the darkness like the curious antenna of some monstrous insect, came to rest upon a spot far ahead. I followed the beam with the disc, and bent closer, to make sure my eyes did not deceive me.

I was looking at a vast cleared place in the pulpy jungle—a cleared space in the center of which there was a city.

A city built of black, sweating stone, each house exactly like every other house: tall, thin slices of

stone, without windows, chimneys or ornamentation of any kind. The only break in the walls was the slit-like door of each house. Instead of being arranged along streets crossing each other at right angles, these houses were built in concentric circles broken only by four narrow streets then ran from the open space in the center of the city to the four points of the compass. Around the entire city was an exceedingly high wall built of and buttressed with the black, sweating stone of which the houses were constructed.

That it was a densely populated city there was ample evidence. People—they were creatures like the messenger; that the Chisee are a people, despite their terrible shape, is hardly debatable—were running up and down the four radial streets, and around the curved connecting streets, in the wildest confusion, their double-elbowed arms flung across their eyes. But even as I watched, the crowd thinned and melted swiftly away, until the streets of the queer, circular city were utterly deserted.

“The city ahead is not the one we are seeking, sir?” asked Croy, who had evidently been observing the

scene through one of the smaller television discs. "I take it that governing city will be farther in the interior."

"According to my rather sketchy information, yes." I replied. "However, keep all the searchlight operators busy, going over very bit of the country within the reach of their beams. You have men on all the auxiliary television discs?"

"Yes, sir."

"Good. Any findings of interest should be reported to me instantly. And—Mr. Croy!"

"Yes, sir?"

"You might order, if you will, that rations be served all men at their posts." Over such country as this, I felt it would be wise to have every man ready for an emergency. It was, perhaps, as well that I issued this order.

It was perhaps half an hour after we had passed the

circular city when, far ahead, I could see the pale, unhealthy forest thinning out. A half dozen of our searchlight beams played upon the denuded area, and as I brought the television disc to bear I saw that we were approaching a vast swamp, in which little pools of black water reflected the dazzling light of our searching beams.

Nor was this all. Out of the swamp a thousand strange, winged things were rising: yellowish, bat-like things with forked tails and fierce hooked beaks. And like some obscene miasma from that swamp, they rose and came straight for the *Ertak*!

Instantly I pressed the attention signal that warned every man on the ship.

“All disintegrator rays in action at once!” I barked into the transmitter. “Broad beams, and full energy. Bird-like creatures, dead ahead; do not cease action until ordered!”

I heard the disintegrator ray generators deepen their notes before I finished speaking, and I smiled grimly,

turning to Correy.

“Slow down as quickly and as much as possible, Mr. Correy,” I ordered. “We have work to do ahead.”

He nodded, and gave the order to the operating room; I felt the forward surge that told me my order was being obeyed, and turned my attention again to the television disc.

The ray operators were doing their work well. The search lights showed the air streaked with fine siftings of greasy dust, and these strange winged creatures were disappearing by the scores as the disintegrator rays beat and played upon them.

But they came on gamely, fiercely. Where there had been thousands, there were but hundreds ... scores ... dozens....

There were only five left. Three of them disappeared at once, but the two remaining came on unhesitatingly, their dirty yellow bat-like wings flapping heavily, their naked heads outstretched, and

hooked beaks snapping.

One of them disappeared in a little sifting of greasy dust, and the same ray dissolved one wing of the remaining creature. He turned over suddenly, the one good wing flapping wildly, and tumbled towards the waiting swamp that has spawned him. Then, as the ray eagerly followed him, the last of that hellish brood disappeared.

“Circle slowly, Mr. Correy,” I ordered. I wanted to make sure there were none of these terrible creatures left. I felt that nothing so terrible should be left alive—even in a world of darkness.

Through the television disc I searched the swamp. As I had half suspected, the filthy ooze held the young of this race of things: grub-like creatures that flipped their heavy bodies about in the slime, alarmed by the light which searched them out.

“All disintegrator rays on the swamp,” I ordered.
“Sweep it from margin to margin. Let nothing be left alive there.”

I had a well trained crew. The disintegrator rays massed themselves into a marching wall of death, and swept up and down the swamp as a plough turns its furrows.

It was easy to trace their passage, for behind them the swamp disappeared, leaving in its stead row after row of broad, dusty paths. When we had finished there was no swamp: there was only a naked area upon which nothing lived, and upon which, for many years, nothing would grow.

“Good work,” I commended the disintegrator ray men. “Cease action.” And then, to Correy, “Put her on her course again, please.”

An hour went by. We passed several more of the strange, damp circular cities, differing from the first we had seen only in the matter of size. Another hour passed, and I became anxious. If we were on our proper course, and I had understood the Chisee messenger correctly, we should be very close to the governing city. We should—

The waving beam of one of the searchlights came suddenly to rest. Three or four other beams followed it—and then all the others.

“Large city to port, sir!” called Croy excitedly.

“Thank you. I believe it is our destination. Cut all searchlights except the forward beam. Mr. Correy!”

“Yes, sir.”

“You can take her over visually now, I believe. The forward searchlight beam will keep our destination in view for you. Set her down cautiously in the center of the city in any suitable place. And—remain at the controls ready for any orders, and have the operating room crew do likewise.”

“Yes, sir,” said Correy crisply.

With a tenseness I could not control, I bent over the hooded television disc and studied the mighty governing city of the Chisee.

The governing city of the Chisee was not unlike the others we had seen, save that it was very much larger, and had eight spoke-like streets radiating from its center, instead of four. The protective wall was both thicker and higher.

There was another difference. Instead of a great open space in the center of the city, there was a central, park-like space, in the middle of which was a massive pile, circular in shape, and built, like all the rest of the city, of the black, sweating rock which seemed to be the sole building material of the Chisee.

We set the *Ertak* down close to the big circular building, which we guessed—and correctly—to be the seat of government. I ordered the searchlight ray to be extinguished the moment we landed, and the ethon tubes that illuminated our ship inside to be turned off, so that we might accustom our eyes as much as possible to darkness, finding our way about with small ethon tube flashlights.

With a small guard, I stood at the forward exit of the *Ertak* and watched the huge circular door back out on

its mighty threads, and finally swing to one side on its massive gimbals. Croy—the only officer with me—and I both wore our menores, and carried full expeditionary equipment, as did the guard.

The Chisee messenger, grimacing and talking excitedly in his sibilant, whispering voice, crouched on all fours (he could not stand in that small space) and waited, three men of the guard on either side of him. I placed his minore on his head and gave him simple, forceful orders, picturing them for him as best I could:

“Go from this place and find others of your kind. Tell them that we would speak to them with things such as you have upon your head. Run swiftly!”

“I will run,” he conveyed to me, “to those great ones who sent me.” He pictured them fleetingly. They were creatures like himself, save that they were elaborately dressed in fine skins of several pale colors, and wore upon their arms, between their two elbows, broad circlets of carved metal which I took to be emblems of power or authority, since the chief of them all wore a

very broad band. Their faces were much more intelligent than their messenger had led me to expect, and their eyes, very large and round, and not at all human, were the eyes of thoughtful, reasoning creatures.

Doubled on all fours, the Chisee crept through the circular exit, and straightened up. As he did so, from out of the darkness a score or more of his fellows rushed up, gathering around him, and blocking the exit with their reedy legs. We could hear than talking excitedly in high-pitched, squeaky whispers. Then, suddenly I received an expression from the Chisee who wore the minore:

“Those who are with me have come from those in power. They say one of you, and one only, is to come with us to our big men who will learn, through a thing such as I wear upon my head, that which you wish to say to them. You are to come quickly; at once.”

“I will come,” I replied. “Have those with you make way—”

A heavy hand fell upon my shoulder; a voice spoke eagerly in my ear:

“Sir, you must not go!” It was Croy, and his voice shook with feeling. “You are in command of the *Ertak*; she, and those in her need you. Let me go! I insist, sir!”

I turned in the darkness, quickly and angrily.

“Mr. Croy,” I said swiftly, “do you realize that you are speaking to your commanding officer?”

I felt his grip tighten on my arm as the reproof struck home.

“Yes, sir,” he said doggedly. “I do. But I repeat that your duty commands you to remain here.”

“The duty of a commander in this Service leads him to the place of greatest danger, Mr. Croy,” I informed him.

“Then stay with your ship, sir!” he pleaded, craftily.

“This may be some trick to get you away, so that they may attack us. Please! Can’t you see that I am right, sir?”

I thought swiftly. The earnestness of the youngster had touched me. Beneath the formality and the “sirs” there was a real affection between us.

In the darkness I reached for his hand; I found it and shook it solemnly—a gesture of Earth which it is hard to explain. It means many things.

“Go, then, Andy,” I said softly. “But do not stay long. An hour at the longest. If you are not back in that length of time, we’ll come after you, and whatever else may happen, you can be sure that you will be well avenged. The *Ertak* has not lost her stinger.”

“Thank you, John,” he replied. “Remember that I shall wear my menore. If I adjust it to full power, and you do likewise, and stand without the shelter of the *Ertak’s* metal hull, I shall be able to communicate with you, should there be any danger.” He pressed my hand again, and strode through the exit out into the

darkness, which was lit only by a few distant stars.

The long, slim legs closed in around him; like a pigmy guarded by the skeletons of giants he was led quickly away.

The minutes dragged by. There was a nervous tension on the ship, the like of which I have experienced not more than a dozen times in all my years.

No one spoke aloud. Now and again one man would matter uneasily to another; there would be a swift, muttered response, and silence again. We were waiting—waiting.

Ten minutes went by. Twenty. Thirty.

Impatiently I paced up and down before the exit, the guards at their posts, ready to obey any orders instantly.

Forty-five minutes. I walked through the exit; stepped out onto the cold, hard earth.

I could see, behind me, the shadowy bulk of the *Ertak*. Before me, a black, shapeless blot against the star-sprinkled sky, was the great administrative building of the Chisee. And in there, somewhere, was Anderson Croy. I glanced down at the luminous dial of my watch. Fifty minutes. In ten minutes more—

“John Hanson!” My name reached me, faintly but clearly, through the medium of my menore. “This is Croy. Do you understand me?”

“Yes,” I replied instantly. “Are you safe?”

“I am safe. All is well. Very well. Will you promise me now to receive what I am about to send, without interruption?”

“Yes,” I replied, thoughtlessly and eagerly. “What is it?”

“I have had a long conference with the chief or head of the Chisee,” explained Croy rapidly. “He is very intelligent, and his people are much further advanced than we thought.

“Through some form of communication, he has learned of the fight with the weird birds; it seems that they are—or were—the most dreaded of all the creatures of this dark world. Apparently we got the whole brood of them, and this chief, whose name, I gather, is Wieschien, or something like that, is naturally much impressed.

“I have given him a demonstration or two with my atomic pistol and the flashlight—these people are fairly stricken by a ray of light directly in the eyes—and we have reached very favorable terms.

“I am to remain here as chief bodyguard and adviser, of which he has need, for all is not peaceful, I gather, in this kingdom of darkness. In return, he is to give up his plans to subjugate the rest of Antri; he has sworn to do this by what is evidently, to him, a very sacred oath, witnessed solemnly by the rest of his council.

“Under the circumstances, I believe he will do what he says; in any case, the great canal will be filled in, and the Antrians will have plenty of time to erect a great series of disintegrator ray stations along the

entire twilight zone, using the broad fan rays to form a solid wall against which the Chisee could not advance even did they, at some future date, carry out their plans. The worst possible result then would be that the people in the sunlit portion would have to migrate from certain sections, and perhaps would have day and night, alternately, as do other worlds.

“This is the agreement we have reached; it is the only one that will save this world. Do you approve, sir?”

“No! Return immediately, and we will show the Chisee that they cannot hold an officer of the Special Patrol as a hostage. Make haste!”

“It’s no go, sir,” came the reply instantly. “I threatened them first. I explained what our disintegrator rays would do, and Wieschien laughed at me.

“This city is built upon great subterranean passages that lead to many hidden exits. If we show the least sign of hostility the work will be resumed on the canal, and, before we can locate the spot, and stop

the work, the damage will be done.

“This is our only chance, sir, to make this expedition a complete success. Permit me to judge this fact from the evidence I have before me. Whatever sacrifice there is to make, I make gladly. Wieschien asks that you depart at once, and in peace, and I know this is the only course. Good-by, sir; convey my salutations to my other friends upon the old *Ertak*, and elsewhere. And now, lest my last act as an officer of the Special Patrol Service be to refuse to obey the commands of my superior officer, I am removing the minore. Good-by!”

I tried to reach him again, but there was no response.

Gone! He was gone! Swallowed up in darkness and in silence!

Dazed, shaken to the very foundation of my being, I stood there between the shadowy bulk of the *Ertak* and the towering mass of the great silent pile that

was the seat of government in this strange land of darkness, and gazed up at the dark sky above me. I am not ashamed, now, to say that hot tears trickled down my cheeks, nor that as I turned back to the *Ertak*, my throat was so gripped by emotion that I could not speak.

I ordered the exit closed with a wave of my hand; in the navigating room I said but four words: “We depart at once.”

At the third meal of the day I gathered my officers about me and told them, as quickly and as gently as I could, of the sacrifice one of their number had made.

It was Kincaide who, when I had finished, rose slowly and made reply.

“Sir,” he said quietly, “We had a friend. Some day, he might have died. Now he will live forever in the records of the Service, in the memory of a world, and in the hearts of those who had the honor to serve with him. Could he—or we—wish more?”

Amid a strange silence he sat down again, and there was not an eye among us that was dry.

I hope that the snappy young officer who visited me the other day reads this little account of bygone times.

Perhaps it will make clear to him how we worked, in those nearly forgotten days, with the tools we had at hand. They were not the perfect tools of to-day, but what they lacked, we somehow made up.

That fine old motto of the Service, "Nothing Less Than Complete Success," we passed on unsullied to those who came after us.

I hope these youngsters of to-day may do as well.

#65 The Sunken Empire, By Harold Thompson Rich:

Concerning the strange adventures of Professor Stevens with the Antillians on the floor of the mysterious Sargasso Sea.

tilted her rudders and dove

- - -

“Then you really expect to find the lost continent of Atlantis, Professor?”

Martin Stevens lifted his bearded face sternly to the reporter who was interviewing him in his study aboard the torpedo-submarine *Nereid*, a craft of his own invention, as she lay moored at her Brooklyn wharf, on an afternoon in October.

“My dear young man,” he said, “I am not even going to look for it.”

The aspiring journalist—Larry Hunter by name—was properly abashed.

“But I thought,” he insisted nevertheless, “that you said you were going to explore the ocean floor under the Sargasso Sea?”

“And so I did.” Professor Stevens admitted, a smile moving that gray beard now and his blue eyes twinkling merrily. “But the Sargasso, an area almost

equal to Europe, covers other land as well—land of far more recent submergence than Atlantis, which foundered in 9564 B. C., according to Plato. What I am going to look for is this newer lost continent, or island rather—namely, the great island of Antillia, of which the West Indies remain above water to-day.”

“Antillia?” queried Larry Hunter, wonderingly. “I never heard of it.”

Again the professor regarded his interviewer sternly.

“There are many things you have never heard of, young man,” he told him. “Antillia may be termed the missing link between Atlantis and America. It was there that Atlantean culture survived after the appalling catastrophe that wiped out the Atlantean homeland, with its seventy million inhabitants, and it was in the colonies the Antillians established in Mexico and Peru, that their own culture in turn survived, after Antillia too had sunk.”

“My Lord! You don’t mean to say the Mayas and Incas originated on that island of Antillia?”

“No, I mean to say they originated on the continent of Atlantis, and that Antillia was the stepping stone to the New World, where they built the strange pyramids we find smothered in the jungle—even as thousands of years before the Atlanteans established colonies in Egypt and founded the earliest dynasties of pyramid-building Pharaohs.”

Larry was pushing his pencil furiously.

“Whew!” he gasped. “Some story, Professor!”

“To the general public, perhaps,” was the reply. “But to scholars of antiquity, these postulates are pretty well known and pretty well accepted. It remains but to get concrete evidence, in order to prove them to the world at large—and that is the object of my expedition.”

More hurried scribbling, then:

“But, say—why don’t you go direct to Atlantis and get the real dope?”

“Because that continent foundered so long ago that it is doubtful if any evidence would have withstood the ravages of time,” Professor Stevens explained, “whereas Antillia went down no earlier than 200 B. C., archaeologists agree.”

“That answers my question,” declared Larry, his admiration for this doughty graybeard rising momentarily. “And now, Professor, I wonder if you’d be willing to say a few words about this craft of yours?”

“Cheerfully, if you think it would interest anyone. What would you care to have me say?”

“Well, in the first place, what does the name *Nereid* mean?”

“Sea-nymph. The derivation is from the Latin and Greek, meaning daughter of the sea-god Nereus. Appropriate, don’t you think?”

“Swell. And why do you call it a torpedo-submarine? How does it differ from the common or navy variety?”

Professor Stevens smiled. It was like asking what was the difference between the sun and the moon, when about the only point of resemblance they had was that they were both round. Nevertheless, he enumerated some of the major modifications he had developed.

Among them, perhaps the most radical, was its motive power, which was produced by what he called a vacuo-turbine—a device that sucked in the water at the snout of the craft and expelled it at the tail, at the time purifying a certain amount for drinking purposes and extracting sufficient oxygen to maintain a healthful atmosphere while running submerged.

Then, the structure of the *Nereid* was unique, he explained, permitting it to attain depths where the pressure would crush an ordinary submarine, while mechanical eyes on the television principle afforded a view in all directions, and locks enabling them to leave the craft at will and explore the sea-bottom were provided.

This latter feat they would accomplish in special suits, designed on the same pneumatic principle as the

torpedo itself and capable of sustaining sufficient inflation to resist whatever pressures might be encountered, as well as being equipped with vibratory sending and receiving apparatus, for maintaining communication with those left aboard.

All these things and more Professor Stevens outlined, as Larry's pencil flew, admitting that he had spent the past ten years and the best part of his private fortune in developing his plans.

"But you'll get it all back, won't you? Aren't there all sorts of Spanish galleons and pirate barques laden with gold supposed to be down there?"

"Undoubtedly," was the calm reply. "But I am not on a treasure hunt, young man. If I find one single sign of former life, I shall be amply rewarded."

Whereupon the young reporter regarded the subject of his interview with fresh admiration, not unmingled with wonder. In his own hectic world, people had no such scorn of gold. Gee, he'd sure like to go along! The professor could have his old statues or whatever

he was looking for. As for himself, he'd fill up his pockets with Spanish doubloons and pieces of eight!

Larry was snapped out of his trance by a light knock on the door, which opened to admit a radiant girl in creamy knickers and green cardigan.

"May I come in, daddy?" she inquired, hesitating, as she saw he was not alone.

"You seem to be in already, my dear," the professor told her, rising from his desk and stepping forward.

Then, turning to Larry, who had also risen, he said:

"Mr. Hunter, this is my daughter, Diane, who is also my secretary."

"I am pleased to meet you, Miss Stevens," said Larry, taking her hand.

And he meant it—for almost anyone would have been pleased to meet Diane, with her tawny gold hair, warm olive cheeks and eyes bluer even than her

father's and just as twinkling, just as intelligent.

"She will accompany the expedition and take stenographic notes of everything we observe," added her father, to Larry's amazement.

"What?" he declared. "You mean to say that—that—"

"Of course he means to say that I'm going, if that's what you mean to say, Mr. Hunter," Diane assured him. "Can you think of any good reason why I shouldn't go, when girls are flying around the world and everything else?"

Even had Larry been able to think of any good reason, he wouldn't have mentioned it. But as a matter of fact, he had shifted quite abruptly to an entirely different line of thought. Diane, he was thinking—Diana, goddess of the chase, the huntress! And himself, Larry Hunter—the hunter and the huntress!

Gee, but he'd like to go! What an adventure, hunting around together on the bottom of the ocean!

What a wild dream, rather, he concluded when his senses returned. For after all, he was only a reporter, fated to write about other people's adventures, not to participate in them. So he put away his pad and pencil and prepared to leave.

But at the door he paused.

"Oh, yes—one more question. When are you planning to leave, Professor?"

At that, Martin Stevens and his daughter exchanged a swift glance. Then, with a smile, Diane said:

"I see no reason why we shouldn't tell him, daddy."

"But we didn't tell the reporters from the other papers, my dear," protested her father.

"Then suppose we give Mr. Hunter the exclusive story," she said, transferring her smile to Larry now. "It will be what you call a—a scoop. Isn't that it?"

"That's it."

She caught her father's acquiescing nod. "Then here's your scoop, Mr. Hunter. We leave to-night."

To-night! This was indeed a scoop! If he hurried, he could catch the late afternoon editions with it.

"I—I certainly thank you, Miss Stevens!" he exclaimed. "That'll make the front page!"

As he grasped the door-knob, he added, turning to her father:

"And I want to thank you too, Professor—and wish you good luck!"

Then, with a hasty handshake, and a last smile of gratitude for Diane, he flung open the door and departed, unconscious that two young blue eyes followed his broad shoulders wistfully till they disappeared from view.

But Larry was unaware that he had made a favorable impression on Diane. He felt it was the reverse. As he headed toward the subway, that vivid blond goddess

of the chase was uppermost in his thoughts.

Soon she'd be off in the *Nereid*, bound for the mysterious regions under the Sargasso Sea, while in a few moments he'd be in the subway, bound under the prosaic East River for New York.

No—damned if he would!

Suddenly, with a wild inspiration, the young reporter altered his course, dove into the nearest phone booth and got his city editor on the wire.

Scoop? This was just the first installment. He'd get a scoop that would fill a book!

And his city editor tacitly O. K.'d the idea.

With the result that when the *Nereid* drew away from her wharf that night, on the start of her unparalleled voyage, Larry Hunter was a stowaway.

The place where he had succeeded in secreting himself was a small storeroom far aft, on one of the

lower decks. There he huddled in the darkness, while the slow hours wore away, hearing only the low hum of the craft's vacuo-turbine and the flux of water running through her.

From the way she rolled and pitched, he judged she was still proceeding along on the surface.

Having eaten before he came aboard, he felt no hunger, but the close air and the dark quarters brought drowsiness. He slept.

When he awoke it was still dark, of course, but a glance at his luminous wrist-watch told him it was morning now. And the fact that the rolling and pitching had ceased made him believe they were now running submerged.

The urge for breakfast asserting itself, Larry drew a bar of chocolate from his pocket and munched on it. But this was scanty fare for a healthy young six-footer, accustomed to a liberal portion of ham and eggs. Furthermore, the lack of coffee made him realize that he was getting decidedly thirsty. The air, moreover,

was getting pretty bad.

“All in all, this hole wasn’t exactly intended for a bedroom!” he reflected with a wry smile.

Taking a chance, he opened the door a crack and sat there impatiently, while the interminable minutes ticked off.

The *Nereid’s* turbine was humming now with a high, vibrant note that indicated they must be knocking off the knots at a lively clip. He wondered how far out they were, and how far down.

Lord, there’d be a riot when he showed up! He wanted to wait till they were far enough on their way so it would be too much trouble to turn around and put him ashore.

But by noon his powers of endurance were exhausted. Flinging open the door, he stepped out into the corridor, followed it to a companionway and mounted the ladder to the deck above.

There he was assailed by a familiar and welcome odor—food!

Trailing it to its origin, he came to a pair of swinging doors at the end of a cork-paved passage. Beyond, he saw on peering through, was the mess-room, and there at the table, among a number of uniformed officers, sat Professor Stevens and Diane.

A last moment Larry stood there, looking in on them. Then, drawing a deep breath, he pushed wide the swinging doors and entered with a cheery:

“Good morning, folks! Hope I’m not too late for lunch!”

Varying degrees of surprise greeted this dramatic appearance. The officers stared, Diane gasped, her father leaped to his feet with a cry.

“That reporter! Why—why, what are you doing here, young man?”

“Just representing the press.”

Larry tried to make it sound nonchalant but he was finding it difficult to bear up under this barrage of disapproving eyes—particularly two very young, very blue ones.

“So that is the way you reward us for giving you an exclusive story, is it?” Professor Stevens’ voice was scathing. “A representative of the press! A stowaway, rather—and as such you will be treated!”

He turned to one of his officers.

“Report to Captain Petersen that we have a stowaway aboard and order him to put about at once.”

He turned to another.

“See that Mr. Hunter is taken below and locked up. When we reach New York, he will be handed over to the police.”

“But daddy!” protested Diane, as they rose to comply, her eyes softening now. “We shouldn’t be too severe with Mr. Hunter. After all, he is probably doing only

what his paper ordered him to.”

Gratefully Larry turned toward his defender. But he couldn't let that pass.

“No, I'm acting only on my own initiative,” he said.

“No one told me to come.”

For he couldn't get his city editor involved, and after all it was his own idea.

“You see!” declared Professor Stevens. “He admits it is his own doing. It is clear he has exceeded his authority, therefore, and deserves no sympathy.”

“But can't you let me stay, now that I'm here?” urged Larry. “I know something about boats. I'll serve as a member of the crew—anything.”

“Impossible. We have a full complement. You would be more of a hindrance than a help. Besides, I do not care to have the possible results of this expedition blared before the public.”

“I’ll write nothing you do not approve.”

“I have no time to edit your writings, young man. My own, will occupy me sufficiently. So it is useless. You are only wasting your breath—and mine.”

He motioned for his officers to carry out his orders.

But before they could move to do so, in strode a lean, middle-aged Norwegian Larry sensed must be Captain Petersen himself, and on his weathered face was an expression of such gravity that it was obvious to everyone something serious had happened.

Ignoring Larry, after one brief look of inquiry that was answered by Professor Stevens, he reported swiftly what he had to say.

While cruising full speed at forty fathoms, with kite-aerial out, their wireless operator had received a radio warning to turn back. Answering on its call-length, he had demanded to know the sender and the reason for the message, but the information had been declined, the warning merely being repeated.

“Was it a land station or a ship at sea?” asked the professor.

“Evidently the latter,” was the reply. “By our radio range-finder, we determined the position at approximately latitude 27, longitude 65.”

“But that, Captain, is in the very area we are headed for.”

“And that, Professor, makes it all the more singular.”

“But—well, well! This is indeed peculiar! And I had been on the point of turning back with our impetuous young stowaway. What would you suggest, sir?”

Captain Petersen meditated, while Larry held his breath.

“To turn back,” he said at length, in his clear, precise English, “would in my opinion be to give the laugh to someone whose sense of humor is already too well developed.”

“Exactly!” agreed Professor Stevens, as Larry relaxed in relief. “Whoever this practical joker is, we will show him he is wasting his talents—even though it means carrying a supernumerary for the rest of the voyage.”

“Well spoken!” said the captain. “But as far as that is concerned, I think I can keep Mr. Hunter occupied.”

“Then take him, and welcome!”

Whereupon, still elated but now somewhat uneasy, Larry accompanied Captain Petersen from the mess-room; started to, that is. But at a glance of sympathy from Diane, he dared call out:

“Say—hold on, folks! I haven’t had lunch yet!”

When young Larry Hunter reported to the captain of the *Nereid*, after this necessary meal, he found that the craft had returned to the surface.

Assigned a pair of powerful binoculars, he was ordered to stand watch in the conning-tower and

survey the horizon in every direction, in an effort to sight the vessel that had sent out that mysterious radio, but though he cast his good brown eyes diligently through those strong lenses, he saw not so much as a smoke tuft upon the broad, gray-blue surface of the hazy Atlantic.

Gradually, however, as the afternoon wore away, something else came in view. Masses of brownish seaweed, supported by small, berry-like bladders, began drifting by. Far apart at first, they began getting more and more dense, till at last, with a thrill, he realized that they were drawing into that strange area known as the Sargasso Sea.

Shortly after this realization dawned, he was ordered below, and as the tropic sun was sinking over that eery floating tombstone, which according to Professor Stevens marked a nation's grave, the *Nereid* submerged.

Down she slid, a hundred fathoms or more, on a long, even glide that took her deep under that veiling brown blanket.

In the navigating room now, Larry stood with the captain, the professor and Diane, studying an illuminated panel on which appeared a cross of five squares, like a box opened out.

The central square reproduced the scene below, while those to left and right depicted it from port and starboard, and those to front and rear revealed the forward and aft aspects of the panorama, thus affording a clear view in every direction.

This, then, was the television device Professor Stevens had referred to the previous afternoon, its mechanical eyes enabling them to search every square inch of those mysterious depths, as they cruised along.

It was the central square that occupied their attention chiefly, however, as they stood studying the panel. While the others represented merely an unbroken vista of greenish water, this one showed the sea floor as clearly as though they had been peering down into a shallow lagoon through a glass-bottomed boat, though it must have been a quarter of a mile below

their cruising level.

A wonderful and fearsome sight it was to Larry: like something seen in a nightmare—a fantastic desert waste of rocks and dunes, with here and there a yawning chasm whose ominous depths their ray failed to penetrate, and now and then a jutting plateau that would appear on the forward square and cause Captain Petersen to elevate their bow sharply.

But more thrilling than this was their first glimpse of a sunken ship—a Spanish galleon, beyond a doubt!

There she lay, grotesquely on her side, half rotted, half buried in the sand, but still discernible. And to Larry's wildly racing imagination, a flood of gold and jewels seemed to pour from her ruined coffers.

Turning to Diane, he saw that her eyes too were flashing with intense excitement.

"Say!" he exclaimed. "Why don't we stop and look her over? There may be a fortune down there!"

Professor Stevens promptly vetoed the suggestion, however.

“I must remind you, young man,” he said severely, “that this is not a treasure hunt.”

Whereupon Larry subsided; outwardly, at least. But when presently the central square revealed another and then another sunken ship, it was all he could do to contain himself.

Now, suddenly, Diane cried out:

“Oh, daddy, look! There’s a modern ship! A—a freighter, isn’t it?”

“A collier, I would say,” was her father’s calm reply. “Rather a large one, too. *Cyclops*, possibly. She disappeared some years ago, en route from the Barbados to Norfolk. Or possibly it is any one of a dozen other steel vessels that have vanished from these seas in recent times. The area of the Sargasso, my dear, is known as ‘The Port of Missing Ships.’”

“But couldn’t we drop down and make sure which ship it is?” she pleaded, voicing the very thought Larry had been struggling to suppress.

At the professor’s reply, however, he was glad he had kept quiet.

“We could, of course,” was his gentle though firm rebuke, “but if we stopped to solve the mystery of every sunken ship we shall probably see during this cruise, we would have time for nothing else. Nevertheless, my dear, you may take a short memorandum of the location and circumstances, in the present instance.”

Whereupon he dictated briefly, while Larry devoted his attention once more to the central square.

Suddenly, beyond a dark pit that seemed to reach down into the very bowels of the earth, rose an abrupt plateau—and on one of its nearer elevations, almost directly under then, loomed a monumental four-sided mound.

“Say—hold on!” called Larry. “Look at that, Professor! Isn’t that a building of some kind?”

Martin Stevens looked up, glanced skeptically toward the panel. But one glimpse at what that central square revealed, and his skepticism vanished.

“A building?” he cried in triumph. “A building indeed! It is a pyramid, young man!”

“Good Lord!”

“Oh, daddy! Really?”

“Beyond a doubt! And look—there are two other similar structures, only smaller!”

Struggling for calm, he turned to Captain Petersen, who had taken his eyes from the forward square and was peering down as well upon those singular mounds.

“Stop! Descend!” was his exultant command. “This is my proof! We have discovered Antillia!”

Swiftly the *Nereid* dropped to that submerged plateau.

In five minutes, her keel was resting evenly on the smooth sand beside the largest of the three pyramids.

Professor Stevens then announced that he would make a preliminary investigation of the site at once.

“For, otherwise, I for one would be quite unable to sleep tonight!” declared the graybeard, with a boyish chuckle.

He added that Diane would accompany him.

At this latter announcement, Larry’s heart sank. He had hoped against hope that he might be invited along with them.

But once again his champion came to his aid.

“We really ought to let Mr. Hunter come with us, daddy, don’t you think?” she urged, noting his disappointment. “After all, it was he who made the

discovery.”

“Very true,” said her father, “but I had not thought it necessary for anyone to accompany us. In the event anyone does, Captain Petersen should have that honor.”

But this honor the captain declined.

“If you don’t mind, sir, I’d prefer to stay with the ship,” he said, quietly. “I haven’t forgotten that radio warning.”

“But surely you don’t think anyone can molest us down here?” scoffed the professor.

“No, but I’d prefer to stay with the ship just the same, sir, if you don’t mind.”

“Very well”—with a touch of pique. “Then you may come along if you care to, Mr. Hunter.”

If he cared to!

“Thanks, Professor!” he said with a grateful look toward Diane. “I’d be keen to!”

So he accompanied them below, where they donned their pressure-suits—rubber affairs rather less cumbersome than ordinary deep-sea diving gear, reinforced with steel wire and provided with thick glass goggles and powerful searchlights, in addition to their vibratory communication apparatus and other devices that were explained to Larry.

When he had mastered their operation, which was rendered simple by reason of the fact that they were so nearly automatic, the trio stepped into a lock on the floor of the ship and Professor Stevens ordered them to couple their suits to air-valve connections on the wall, at the same time admitting water by opening another valve.

Swiftly the lock flooded, while their suits inflated.

“All right?” came his vibratory query.

“Right!” they both answered.

“Then stand by for the heavy pressure.”

Wider now he opened the water-valve, letting the ocean in, while at the same time their suits continued inflating through their air-valve connections.

To his surprise, Larry found himself no more inconvenienced by the pressure than he had been from the moment the submarine dove to its present depth. Indeed, most of the air that was coming into his suit was filling the reinforced space between its inner and outer layers, much as the *Nereid* held air under pressure between her two thick shells.

“All right now?” called out the professor’s vibrator.

“Right!” they called back again.

“Then uncouple your air-valve connections and make ready.”

They did so; and he likewise.

Then, advancing to a massive door like that of a vault,

he flung back its powerful clamps, dragged it open—and there beyond, its pressure equaled by that within the lock, loomed the black tide of the ocean bottom.

Awed by this solemn sight, tingling with a sense of unparalleled adventure, Larry stood there a moment, peering out over the threshold of that untrodden world.

Then he followed Diane and her father into its beckoning mystery....

Their searchlights cutting bright segments into the dark, they proceeded toward the vast mound that towered ahead, pushing through a weird realm of phosphorescent fish and other marine creatures.

As they neared it, any possible doubt that it was in fact a pyramid vanished. Corroded by the action of salt water and covered with the incrustations of centuries, it nevertheless presented unmistakable evidence of human construction, rising in steps of massive masonry to a summit shadowy in the murk above.

As Larry stood gazing upon that mighty proof that this submerged plateau had once stood forth proudly above the sea, he realized that he was a party to one of the most profound discoveries of the ages. What a furore this would make when he reported it back to his New York paper!

But New York seemed remote indeed, now. Would they ever get back? What if anything went wrong with their pressure-suits—or if they should become lost?

He glanced back uneasily, but there gleamed the reassuring lights of the *Nereid*, not a quarter of a mile away.

Diane and her father were now rounding a corner of the pyramid and he followed them, his momentary twinge of anxiety gone.

For some moments, Professor Stevens prowled about without comment, examining the huge basal blocks of the structure and glancing up its sloping sides.

“You see, I was right!” he declared at length. “This is

not only a man-made edifice but a true pyramid, embodying the same architectural principles as the Mayan and Egyptian forms. We see before us the visible evidence of a sunken empire—the missing link between Atlantis and America.”

No comments greeted this profound announcement and the professor continued:

“This structure appears to be similar in dimensions with that of the pyramid of Xochicalco, in Mexico, which in turn approximates that of the “Sacred Hill” of Atlantis, mentioned by Plato, and which was the prototype of both the Egyptian and Mayan forms. It was here the Antillians, as the Atlanteans had taught them to do, worshipped their grim gods and performed the human sacrifices they thought necessary to appease them. And it was here, too, if I am not mistaken, that—”

Suddenly his vibratory discourse was broken into by a sharp signal from the submarine:

“Pardon interruption! Hurry back! We are attacked!”

At this, the trio stood rigid.

“Captain Petersen! Captain Petersen!” Larry heard the professor call. “Speak up! Give details! What has happened?”

But an ominous silence greeted the query.

Another moment they stood there, thoroughly dismayed now. Then came the professor’s swift command:

“Follow me—quickly!”

He was already in motion, retracing his steps as fast as his bulky suit would permit. But as he rounded the corner of the pyramid, they saw him pause, stand staring. And as they drew up, they in turn paused; stood staring, too.

With sinking hearts, they saw that the *Nereid* was gone.

Stunned by this disaster, they stood facing one

another—three lone human beings, on the bottom of the Atlantic ocean, their sole means of salvation gone.

Professor Stevens was the first to speak.

“This is unbelievable!” he said. “I cannot credit it. We must have lost our senses.”

“Or our bearings!” added Diane, more hopefully.

“Suppose we look around the other side.”

As for Larry, a darker suspicion flashed through his mind. Captain Petersen! Had he seized his opportunity and led the crew to mutiny, in the hope of converting the expedition into a treasure hunt? Was that the reason he had been so willing to remain behind?

He kept his suspicion to himself, however, and accompanied Diane and her father on a complete circuit of the pyramid; but, as he feared, there was no sign of the *Nereid* anywhere. The craft had vanished as completely as though the ocean floor had opened and swallowed her up.

But no, not as completely as that! For presently the professor, who had proceeded to the site where they left the craft resting on the sand, called out excitedly:

“Here—come here! There are tracks! Captain Petersen was right! They were attacked!”

Hurrying to the scene, they saw before them the plain evidences of a struggle. The ocean bottom was scuffed and stamped, as though by many feet, and a clear trail showed where the craft had finally been dragged away.

Obviously there was but one thing to do and they did it. After a brief conference, they turned and followed the trail.

It led off over the plateau a quarter mile or more, in an eastward direction, terminating at length beside one of the smaller pyramids—and there lay the *Nereid*, apparently unharmed.

But her lights were out and there came no answer to their repeated calls, so they judged she must be

empty.

What had happened to Captain Petersen and his crew? What strange sub-sea enemy had overcome them? What was now their fate?

Unanswerable question! But one thing was certain. Larry had misjudged the captain in suspecting him of mutiny. He was sorry for this and resolved he would make amends by doing all in his power to rescue him and his men, if they were still living.

Meanwhile his own plight, and that of Diane and her father, was critical. What was to be done?

Suddenly, as all three stood there debating that question, Professor Stevens uttered an exclamation and strode toward the pyramid. Following him with their eyes, they saw him pass through an aperture where a huge block of stone had been displaced—and disappear within.

The next moment they had joined him, to find themselves in a small flooded chamber at whose far

end a narrow gallery sloped upward at a sharp angle.

The floor and walls were tiled, they noted, and showed none of the corrosion of the exterior surfaces. Indeed, so immaculate was the room that it might have been occupied but yesterday.

As they stood gazing around in wonder, scarcely daring to draw the natural inferences of this phenomena, there came a rasping sound, and, turning toward the entrance, they saw a massive section of masonry descend snugly into place.

They were trapped!

Standing there tense, speechless, they waited, wondering what would be the next move of this strange enemy who held them now so surely in his power.

Nor had they long to wait.

Almost immediately, there issued a gurgling sound from the inclined gallery, and turning their eyes in the

direction of this new phenomena, they saw that the water level was receding, as though under pressure from above.

“Singular!” muttered Professor Stevens. “A sort of primitive lock. It seems incredible that human creatures could exist down here, but such appears to be the case.”

Larry had no desire to dispute the assumption, nor had Diane. They stood there as people might in the imminence of the supernatural, awaiting they knew not what.

Swiftly the water receded.

Now it was scarcely up to their waists, now splashing about their ankles, and now the room was empty.

The next moment, there sounded a rush of feet—and down the gallery came a swarm of the strangest beings any of them had ever seen.

They were short, thin, almost emaciated, with pale,

pinched faces and pasty, half-naked bodies. But they shimmered with ornaments of gold and jade, like some strange princes from the realm of Neptune—or rather, like Aztec chieftains of the days of Cortes, thought Larry.

Blinking in the glare of the searchlights, they clamored around their captives, touching their pressure-suits half in awe and chattering among themselves.

Then one of them, larger and more regally clad than the rest, stepped up and gestured toward the balcony.

“They obviously desire us to accompany them above,” said the professor, “and quite as obviously we have little choice in the matter, so I suggest we do so.”

“Check!” said Larry.

“And double-check!” added Diane.

So they started up, preceded by a handful of their captors and followed by the main party.

The gallery seemed to be leading toward the center of the pyramid, but after a hundred feet or so it turned and continued up at a right angle, turning twice more before they arrived at length in another stone chamber, smaller than the one below.

Here their guides paused and waited for the main party.

There followed another conference, whereupon their leader stepped up again, indicating this time that they were to remove their suits.

At this, Professor Stevens balked.

“It is suicide!” he declared. “The air to which they are accustomed here is doubtless at many times our own atmospheric pressure.”

“But I don’t see that there’s anything to do about it,” said Larry, as their captors danced about them menacingly. “I for one will take a chance!”

And before they could stop him, he had pressed the

release-valve, emitting the air from his suit—slowly, at first, then more and more rapidly, as no ill effects seemed to result.

Finally, flinging off the now deflated suit, he stepped before them in his ordinary clothes, calling with a smile:

“Come on out, folks—the air’s fine!”

This statement was somewhat of an exaggeration, as the air smelt dank and bad. But at least it was breathable, as Diane and her father found when they emerged from their own suits.

They discovered, furthermore, now that their flashlights were no longer operating, that a faint illumination lit the room, issuing from a number of small crystal jars suspended from the walls: some sort of phosphorescence, evidently.

Once again the leader of the curious throng stepped up to them, beaming now and addressing Professor Stevens in some barbaric tongue, and, to their

amazement, he replied in words approximating its harsh syllables.

“Why, daddy!” gasped Diane. “How can you talk to him?”

“Simply enough,” was the reply. “They speak a language which seems to be about one-third Basque, mixed oddly with Greek. It merely proves another hypothesis of mine, namely, that the Atlantean influence reached eastward to the Pyrenees mountains and the Hellenic peninsula, as well as to Egypt.”

Whereupon he turned and continued his conversation, haltingly it is true and with many gestures, but understandably nevertheless.

“I have received considerable enlightenment as to the mystery of this strange sunken empire,” he reported, turning back to them at length. “It is a singular story this creature tells, of how his country sank slowly beneath the waves, during the course of centuries, and of how his ancestors adapted themselves by

degrees to the present conditions. I shall report it to you both, in detail, when time affords. But the main thing now is that a man similar to ourselves has conquered their country and set himself up as emperor. It is to him we are about to be taken."

"But it doesn't seem possible!" exclaimed Diane.
"Why, how could he have got down here?"

"In a craft similar to our own, according to this creature. Heaven knows what it is we are about to face! But whatever it is, we will face it bravely."

"Check and double-check!" said Larry, with a glance toward Diane that told her she would not find him wanting.

They were not destined to meet the test just then, however, for just at that moment a courier in breech-clout and sandals dashed up the gallery and burst into the room, bearing in his right hand a thin square of metal.

Bowing, he handed it to the leader of the pigmy

throng, with the awed word:

“Cabiri!”

At this, Professor Stevens gave a start.

“A message from their high priests!” he whispered.

Whatever it contained, the effect produced on the reader was profound. Facing his companions, he addressed them gravely. Then, turning from the room, he commanded the captives to follow.

The way led back down the inclined gallery to a point where another door now stood open, then on down until finally the passage leveled out into a long, straight tunnel.

This they traversed for fully a mile, entering at length a large, square chamber where for a moment they paused.

“I judge we are now at the base of the large pyramid,” the professor voiced in an undertone. “It would

naturally be the abode of the high priests.”

“But what do you suppose they want with us?” asked Diane.

“That I am not disposed to conjecture,” was her father’s reply.

But the note of anxiety in his voice was not lost on Diane, nor on Larry, who pressed her hand reassuringly.

Now their captors led them from the room through a small door opening on another inclined gallery, whose turns they followed until all were out of breath from the climb.

It ended abruptly on a short, level corridor with apertures to left and right.

Into the latter they were led, finding themselves in a grotesquely furnished room, lit dimly by phosphorescent lamps.

Swiftly the leader addressed Professor Stevens. Then all withdrew. The aperture was closed by a sliding block of stone.

For a moment they stood there silent, straining their eyes in the gloom to detect the details of their surroundings, which included several curious chairs and a number of mattings strewn on the tiled floor.

“What did he say?” asked Diane at length, in a tremulous voice.

“He said we will remain here for the night,” her father replied, “and will be taken before the high priests at dawn.”

“At dawn!” exclaimed Larry. “How the deuce do they know when it is dawn, down here?”

“By their calendars, which they have kept accurately,” was the answer. “But there are many other questions you must both want to ask, so I shall anticipate them by telling you now what I have been able to learn. Suppose we first sit down, however. I for one am

weary.”

Whereupon they drew up three of those curious chairs of some heavy wood carved with the hideous figures of this strange people’s ancient gods, and Professor Stevens began.

Their sunken empire, as he had surmised, had indeed been the great island of Antillia and a colony of Atlantis. A series of earthquakes and tidal waves such as engulfed their homeland ages before had sent it down, and the estimated archaeological date of the final submergence—namely, 200 B. C.—was approximately correct.

But long before this ultimate catastrophe, the bulk of the disheartened population had migrated to Central and South America, founding the Mayan and Incan dynasties. Many of the faithful had stayed on, however, among them most of the Cabiri or high priests, who either were loath to leave their temples or had been ordered by their gods to remain.

At any rate, they had remained, and as the great

island sank lower and lower, they had fortified themselves against the disaster in their pyramids, which by then alone remained above the surface.

These, too, had gradually disappeared beneath the angry waters, however, and with them had disappeared the steadfast priests and their faithful followers, sealing their living tombs into air-tight bell-jars that retained the atmosphere.

This they had supplemented at first by drawing it down from above, but as time went by they found other means of getting air; extracting it from the sea water under pressure, by utilizing their subterranean volcanoes, in whose seething cauldrons the gods had placed their salvation; and it was this process that now provided them with the atmosphere which had so amazed their captives.

But naturally, lack of sunshine had produced serious degeneration in their race, and that accounted for their diminutive forms and pale bodies. Still, they had been able to survive with a degree of happiness until some ten or a dozen years ago, when a strange enemy

had come down in a great metal fish, like that of these new strangers, and with a handful of men had conquered their country.

This marauder was after their gold and had looted their temples ruthlessly, carrying away its treasures, for which they hated him with a fury that only violation of their most sacred deities could arouse. Long ago they would have destroyed him, but for the fact that he possessed terrible weapons which were impossible to combat. But they were in smouldering rebellion and waited only the support of their gods, when they would fall on this oppressor and hurl him off.

That, though it left many things unexplained, was all the professor had been able to gather from his conversation with the leader of their captors. He ended, admitting regretfully that he was still in ignorance of what fate had befallen Captain Petersen and the crew of the *Nereid*.

“Perhaps this fellow in the other submarine has got them,” suggested Larry.

“But why weren’t we taken to him too?” asked Diane.
“What do you suppose they want with us, anyway, daddy?”

“That, my dear, as I told you before,” replied her father, “I am not disposed to conjecture. Time will reveal it. Meanwhile, we can only wait.”

As before, there was a note of anxiety in his voice not lost on either of them. And as for Larry, though he knew but little of those old religions, he knew enough to realize that their altars often ran with the blood of their captives, and he shuddered.

With these grim thoughts between them, the trio fell silent.

A silence that was interrupted presently by the arrival of a native bearing a tray heaped with strange food.

Bowing, he placed it before them and departed.

Upon examination, the meal proved to consist mainly of some curious kind of steamed fish, not unpalatable

but rather rank and tough. There were several varieties of fungus, too, more or less resembling mushrooms and doubtless grown in some sunless garden of the pyramid.

These articles, together with a pitcher of good water that had obviously been distilled from the sea, comprised their meal, and though it was far from appetizing, they ate it.

But none of the three slept that night, though Diane dozed off for a few minutes once or twice, for their apprehension of what the dawn might hold made it impossible, to say nothing of the closeness of the air in that windowless subterranean room.

Slowly, wearily, the hours dragged by.

At length the native who had brought their food came again. This time he spoke.

“He says we are now to be taken before the high priests,” Professor Stevens translated for them.

Almost with relief, though their faces were grave, they stepped out into the corridor, where an escort waited.

Five minutes later, after proceeding along an inclined gallery that wound ever upward, they were ushered into a vast vaulted chamber lit with a thousand phosphorescent lamps and gleaming with idols of gold and silver, jewels flashing from their eyes.

High in the dome hung a great golden disc, representing the sun. At the far end, above a marble altar, coiled a dragon with tusks of ivory and scales of jade, its eyes two lustrous pearls.

And all about the room thronged priests in fantastic head-dress and long white robes, woven through elaborately with threads of yellow and green.

At the appearance of the captives, a murmur like a chant rose in the still air. Someone touched a brand to the altar and there was a flash of flame followed by a thin column of smoke that spiraled slowly upward.

Now one of the priests stepped out—the supreme one among them, to judge from the magnificence of his robe—and addressed the trio, speaking slowly, rhythmically.

As his strange, sonorous discourse continued, Professor Stevens grew visibly perturbed. His beard twitched and he shifted uneasily on his feet.

Finally the discourse ceased and the professor replied to it, briefly. Then he turned grave eyes on Larry and Diane.

“What is it?” asked the latter, nervously. “What did the priest say, daddy?”

Her father considered, before replying.

“Naturally, I did not gather everything,” was his slow reply, “but I gathered sufficient to understand what is afoot. First, however, let me explain that the dragon you see over there represents their deity Tlaloc, god

of the sea. In more happy circumstances, it would be interesting to note that the name is identified with the Mayan god of the same element.”

He paused, as though loath to go on, then continued:

“At any rate, the Antillians have worshipped Tlaloc principally, since their sun god failed them. They believe he dragged down their empire in his mighty coils, through anger with them, and will raise it up again if appeased. Therefore they propose today to—”

“Daddy!” cried Diane, shrinking back in horror, while a chill went up Larry’s spine. “You mean—mean that —”

“I mean, my poor child, that we are about to be sacrificed to the dragon god of the Antillians.”

The words were no more than uttered, when with a weird chant the Cabiri closed in on their victims and led them with solemn ceremonial toward the altar.

In vain did Professor Stevens protest. Their decision

had been made and was irrevocable. Tlaloc must be appeased. Lo, even now he roared for the offering!

They pointed to the dragon, from whose nostrils suddenly issued hissing spurts of flame.

Larry fumed in disgust at the cheap hocus-pocus of it—but the next moment a more violent emotion swept over him as he saw Diane seized and borne swiftly to that loathsome shrine.

But even as he lunged forward, the professor reached his daughter's side. Throwing himself in front of her, he begged them to spare her, to sacrifice him instead.

The answer of the priests was a blow that knocked the graybeard senseless, and lifting Diane up, half-swooning, they flung her upon the altar.

"Mr. Hunter! Larry!" came her despairing cry.

She struggled up and for a moment her blue eyes opened, met his beseechingly.

That was enough—that and that despairing cry,
“Larry!”

With the strength of frenzy, he flung off his captors,
rushed to her aid, his hard fists flailing.

The pigmies went down in his path like grain before
the scythe. Reaching the altar, he seized the priest
whose knife was already upraised, and, lifting him
bodily, flung him full into the ugly snout of that
snorting dragon.

Then, as a wail of dismay rose from the Cabiri, at this
supreme sacrilege, he seized the now unconscious
Diane and retreated with her toward the door.

But there spears barred his escape; and now,
recovered from the first shock of this fearful affront to
their god, the priests started toward him.

Standing at bay, with that limp, tender burden in his
arms, Larry awaited the end.

As the maddened horde drew near, she stirred, lifted

her pale face and smiled, her eyes still shut.

“Oh, Larry!”

“Diane!”

“You saved me. I won’t forget.”

Then, the smile still lingering, she slipped once more into merciful oblivion, and as Larry held her close to his heart, a new warmth kindled there.

But bitterness burned in his heart, too. He had saved her—won her love, perhaps—only to lose her. It wasn’t fair! Was there no way out?

The priests were close now, their pasty faces leering with fierce anticipation of their revenge, when suddenly, from down the gallery outside that guarded door, came the sharp crash of an explosion, followed by shouts and the rush of feet.

At the sound, the priests trembled, fled backward into the room and fell moaning before their idols, while

the quaking guards strove frantically to close the door.

But before they could do so, in burst a half dozen brawny sailors in foreign uniform, bearing in their hands little black bulbs that looked suspiciously like grenades. Shouting in a tongue Larry could not distinguish above the uproar, they advanced upon the retreating guards and priests.

Then, when all were herded in the far corner of the room, the sailors backed toward the door. Motioning for Larry and Diane to clear out, they raised those sinister little missiles, prepared to fling them.

“Wait!” cried Larry, thinking of Professor Stevens.

And releasing Diane, who had revived, he rushed forward, seized the prostrate savant from amid the unresisting Cabiri, and bore him to safety.

“Daddy!” sobbed Diane, swaying to meet them.

“Back!” shouted one of the sailors, shoving them

through the door.

The last glimpse Larry had of that fateful room was the horde of priests and guards huddled before their altar, voices lifted in supplication to that hideous dragon god.

Then issued a series of blinding flashes followed by deafening explosions, mingled with shrieks of anguish.

Sickened, he stood there, as the reverberations died away.

Presently, when it was plain no further menace would come from that blasted temple, their rescuers led the trio back down those winding galleries, and through that long, straight tunnel to the smaller pyramid.

Professor Stevens had recovered consciousness by now and was able to walk, with Larry's aid, though a matted clot of blood above his left ear showed the force of the blow he had received.

The way, after reaching the smaller pyramid, led up those other galleries they had mounted the night before.

This time, undoubtedly, they were to be taken before that mysterious usurping emperor. And what would be the result of that audience? Would it but plunge them from the frying pan into the fire, wondered Larry, or would it mean their salvation?

Anyway, he concluded, no fate could be worse than the hideous one they had just escaped. But if only Diane could be spared further anguish!

He glanced at her fondly, as they walked along, and she returned him a warm smile.

Now the way led into a short, level passage ending in a door guarded by two sailors with rifles. They presented arms, as their comrades came up, and flung open the door.

As he stepped inside, Larry blinked in amazement, for he was greeted by electric lights in ornate clusters,

richly carpeted floors, walls hung with modern paintings—and there at the far end, beside a massive desk, stood an imposing personage in foreign naval uniform of high rank, strangely familiar, strangely reminiscent of war days.

Even before the man spoke, in his guttural English, the suspicion those sailors had aroused crystallized itself.

A German! A U-boat commander!

“Greetings, gentlemen—and the little lady,” boomed their host, with heavy affability. “I see that my men were in time. These swine of Antillians are a tricky lot. I must apologize for them—my subjects.”

The last word was pronounced with scathing contempt.

“We return greetings!” said Professor Stevens. “To whom, might I ask, do we owe our lives, and the honor of this interview?”

Larry smiled. The old graybeard was up to his form, all right!

“You are addressing Herr Rolf von Ullrich,” the flattered German replied, adding genially:

“commander of one of His Imperial Majesty’s super-submarines during the late war and at present Emperor of Antillia.”

To which the professor replied with dignity that he was greatly honored to make the acquaintance of so exalted a personage, and proceeded in turn to introduce himself and party. But Von Ullrich checked him with a smile.

“The distinguished Professor Stevens and his charming daughter need no introduction, as they are already familiar to me through the American press and radio,” he said. “While as for Mr. Hunter, your Captain Petersen has already made me acquainted with his name.”

At the mention of the commander of the *Nereid*, all three of them gave a start.

“Then—then my captain and crew are safe?” asked the professor, eagerly.

“Quite,” Von Ullrich assured him. “You will be taken to them presently. But first there are one or two little things you would like explained—yes? Then I shall put to you a proposal, which if acceptable will guarantee your safe departure from my adopted country.”

Whereupon the German traced briefly the events leading up to the present.

During the last months of the war, he had been placed in command of a special U-boat known as the “mystery ship”—designed to resist depth-charges and embodying many other innovations, most of them growing out of his own experience with earlier submarines.

One day, while cruising off the West Indies, in wait for some luckless sugar boat, he had been surprised by a destroyer and forced to submerge so suddenly that his diving gear had jammed and they had gone to the bottom. But the craft had managed to withstand the

pressure and they had been able to repair the damage, limping home with a bad leak but otherwise none the worse for the experience.

The leak repaired and the hull further strengthened, he had set out again. But when in mid-Atlantic the Armistice had come, and rather than return to a defeated country, subject possibly to Allied revenge, he had persuaded his crew to remain out and let their craft be reported missing.

What followed then, though Von Ullrich masked it in polite words, was a story of piracy, until they found by degrees that there was more gold on the bottom of the ocean than the top; and from this to the discovery of the sunken empire where he now held reign was but a step.

They had thought at first they were looting only empty temples—but, finding people there, had easily conquered them, though ruling them, he admitted, was another matter. As, for instance, yesterday, when the priests had interfered with his orders and carried his three chief captives off to sacrifice.

“Where now, but for me, you would be food for their gods!” he ended. “And if you do not find my hospitality altogether to your liking, friends, remember that you came uninvited. In fact, if you will recall, you came despite my explicit warning!”

But since they were here, he told them, they might be willing to repay his good turn with another.

Whereupon Von Ullrich launched into his proposal, which was that Professor Stevens place the *Nereid* at his disposal for visiting the depths at the foot of the plateau, where lay the capital of the empire, he said—a magnificent metropolis known as the City of the Sun and modeled after the great Atlantean capital, the City of the Golden Gates, and the depository of a treasure, the greedy German believed, that was the ransom of the world.

The professor frowned, and for a moment Larry thought he was going to remind their host that this was not a treasure hunt.

“Why,” he asked instead, “do you not use your own

submarine for the purpose?”

“Because for one thing, she will not stand the pressure, nor will our suits,” was the reply. “And for another, she is already laden with treasure, ready for an—er—forced abdication!” with a sardonic laugh.

“Then have you not enough gold already?”

“For myself, yes. But there are my men, you see—and men who have glimpsed the treasures of the earth are not easily satisfied, Professor. But have no fear. You shall accompany us, and, by your aid, shall pay your own ransom.”

Von Ullrich made no mention of the alternative, in case the aid was refused, but the ominous light Larry caught in his cold gray eyes spoke as clearly as words.

So, since there was nothing else to do, Professor Stevens agreed.

Whereupon the audience terminated and they were

led from the presence of this arrogant German to another apartment, where they were to meet Captain Petersen and the crew of the *Nereid*.

As they proceeded toward it, under guard, Larry wondered why Von Ullrich had even troubled to make the request, when he held it in his power to take the craft anyway.

But after the first joyful moment of reunion, it was a mystery no longer, for Captain Petersen reported that immediately upon their capture, the commander of the U-boat had tried to force him to reveal the operation of the *Nereid*, but that he had steadfastly refused, even though threatened with torture.

And to think, it came to Larry with a new twinge of shame, that he had suspected this gallant man of mutiny!

That very morning, while Professor Stevens and his party were still exchanging experiences with Captain Petersen and the members of the crew, Von Ullrich sent for them and they gathered with his own men in

the small lock-chamber at the base of the pyramid.

There they were provided with temporary suits by their host, since their own—which they brought along—could be inflated only from the *Nereid*.

Beside her, they noted as they emerged in relays, the U-boat was now moored.

Entering their own craft, they got under way at once and headed swiftly westward toward the brink of the plateau. Most of Von Ullrich's crew were with them, though a few had been left behind to guard against any treachery, on the part of the now sullen and aroused populace.

Slipping out over the edge of that precipitous tableland, they tilted her rudders and dove to the abyss below.

Presently the central square of the illuminated panel in the navigating room showed three great concentric circles, enclosed by a quadrangle that must have been miles on a side—and within this vast sunken fortress

lay a city of innumerable pyramids and temples and palaces.

The German's eyes flashed greedily as he peered upon this vision.

"There you are!" he exclaimed, quivering with excitement. "Those circles, that square: what would you judge they were, Professor?"

"I would judge that originally they were the canals bearing the municipal water supply," Martin Stevens told him quietly, suppressing his own excitement, "for such was said to be the construction of the City of the Golden Gates; but now I judge they are walls raised on those original foundations by the frantic populace, when the submergence first began, in a vain effort to hold back the tides that engulfed them."

"And do you think they are of gold?"

"Frankly, no; though I have no doubt you will find plenty of that element down there."

Nor was the prediction wrong, for modern eyes had never seen such a treasure house as they beheld when presently the *Nereid* came to rest outside that ancient four-walled city and they forced their way inside.

Though the walls were not of gold, the inner gates were, and the temples were fairly bursting with the precious metal, as well as rare jewels, the eyes of a thousand idols gleaming with rubies and emeralds.

But where was the populace, amid all this prodigious wealth? Was there no life down here?

Von Ullrich declared through the vibrator of his pressure-suit that he had heard there was. And as though in substantiation, many of the temples showed the same bell-jar construction as the pyramids above, though even stouter, revealing evidences of having been occupied very recently; but all were flooded and empty. The city was as a city of the dead.

This ominous sign did not deter the “emperor,” however. Ruthlessly he and his men looted those

flooded temples, forcing Professor Stevens and his party to lend aid in the orgy of pillage.

And all the time, Larry had an uneasy feeling of gathering furtive hosts about them, waiting—waiting for what?

He confided his fears to no one, though he noted with relief that Von Ullrich seemed to sense these unseen presences too, for he proceeded with caution and always kept a strong guard outside.

By early afternoon, the *Nereid* was one great coffer-chest.

But still the rapacious U-boat commander was unsatisfied, though Professor Stevens began to have doubts if his craft could lift that massive weight of plunder to the top of the plateau.

“One more load and we go,” he soothed. “A few more pretties for the little lady!”

Larry writhed, and should have suspected then and

there—but as it was, the blow fell unexpected, stunning.

Filing from the lock, they failed to notice that Von Ullrich and his crew hung back, until there came a sudden, guttural command, whereupon Diane was seized and the massive door flung shut in their faces.

Appalled by this overwhelming disaster, the party stood for a moment motionless, speechless. Then, as one, Larry and the professor rushed forward and beat upon that barred hatch, calling upon Von Ullrich to open it.

From within the submarine, through their vibrators, they heard him laugh.

“Auf Wiedersehen!” he toasted them. “I now have all the treasure I want! The rest I leave to you! Help yourselves!”

Even as he spoke, the *Nereid’s* auxiliary propellers started churning the water. Slowly, sluggishly, like some great gorged fish, the sturdy craft moved off,

lifted her snout, headed upward.

Professor Stevens bowed his head, and Larry could well picture the grief that distorted the graybeard's face, inside that owl-eyed helmet.

"Cheer up!" he said, though his own face was twisted with anguish. "Perhaps—"

Then he paused—for how could he say that perhaps the situation wasn't as bad as it seemed, when it was obviously hopeless?

"My poor Diane!" moaned the professor. "Poor child. Poor child!"

As for Captain Petersen and the crew, they said nothing. Perhaps they were thinking of Diane, perhaps of themselves. At least, they knew it was over.

Or so they thought. But to Larry, suddenly, occurred a gleam of hope. That strange sense of unseen presences! It was bizarre, of course, but doesn't a

drowning person catch at straws? And Lord knows they were drowning, if ever anyone was!

He turned and confided to Professor Stevens his idea, which was to retrace their steps within the city gates, seek out the populace and throw themselves on their mercy.

The stricken savant, too, grasped at the straw.

“It seems fantastic, but after all it is a chance,” he admitted.

So they pushed back into that great submerged city, with Captain Petersen and his skeptical crew. They entered one of the largest of the temples, wandered forlornly through its flooded halls and corridors, seeking some sign of these alleged beings Larry had sensed.

Nor was their search unrewarded, for suddenly the captain himself, most skeptical of all, cried out:

“Listen! Did you hear that?”

There was no need to ask the question, for all had heard. It was a rasping sound, as of some great door swinging shut, followed almost immediately by a rushing gurgle—and as they stood there tense, the water level began rapidly receding.

Even while it was still splashing about their ankles, a secret block of masonry slid back and a horde of Antillians burst in upon them.

What happened then, happened with a rush that left them dazed.

Unable to talk directly with the pigmies, by reason of their pressure-suits, which they dared not remove, they started gesturing with them, trying to explain their predicament and make known that they bore them no ill-will, but the creatures waved for them to cease and led them swiftly through the now waterless temple.

“Well, I guess it’s all up!” said Larry, adding with dismal humor: “They’re probably going to finish that meal they started feeding their dragon last night!”

No one laughed, nor made any comment, and he relapsed into silence, realizing that they probably held him responsible for this latest disaster.

Leaving the temple, their captors led them into a passage that was level for a time, then inclined sharply. It was laborious going but they struggled on.

“I believe they know we are not their enemies!” declared Professor Stevens, at length, to everyone’s cheer. “They seem to be leading us back to the plateau by some underground passage.”

“Let’s hope so!” said Larry. “Perhaps I had the right hunch after all.”

“But my poor Diane!” came the professor’s sorrowing after-thought. “That fiend Von Ullrich could never get the *Nereid* up safely.”

“I think perhaps he could, with Miss Stevens to help him,” put in Captain Petersen, his usual optimism returning. “She is thoroughly familiar with the craft’s operation.”

“That is so,” her father admitted, his tone brighter.
“But—”

“Of course it’s so!” exclaimed Larry, breaking off any less hopeful reflections. “So cheerio, folks, as the English say. We’ll make it yet!”

But in his heart, he was tormented with doubt for Diane’s safety....

The trail was growing eery, now, and precipitous. To their right rose a sheer cliff. To their left, the path fell off abruptly to a gigantic caldron where red flames leaped and waned.

“Looks like something out of Dante’s ‘Inferno’!” muttered Larry, with a shudder.

“The volcano where they distill their atmosphere, evidently,” commented Professor Stevens. “It would have been interesting, in other circumstances, to observe the process.”

“Not to me, it wouldn’t!”

Larry was glad when they had passed that seething hell-pot and were once more proceeding through a long, dark gallery.

But everywhere, though their guides were but a handful, was a sense of those unseen presences, of gathering, furtive hosts about them, waiting—waiting for what?

What was this strange sense of tension, of foreboding, that hung in the air? Was the professor wrong? Were they being led to their doom, after all?

He was soon to know, for now the gallery they had been traversing levelled out into a series of short passages, each barred by a heavy stone door, and finally they were led into a small, square room, barely large enough to admit them all.

There, with gestures toward the far end, their guides left them.

The door closed, and almost immediately another on the opposite side opened, slowly at first, then wider

and wider, admitting a rush of water that promptly filled the room.

Stepping wonderingly out, they found themselves on the upper level, beside the second of the two smaller pyramids.

“Whew!” gasped Larry, as they stood looking around, still a little dazed. “These people are sure quick-change artists! First they try to feed you to their gods, then they save you from almost as bad a fate. Dizzy, I call it!”

“Quite understandable, I should say,” declared the professor. “Unable to cope with Von Ullrich themselves, they think perhaps we may be able to.”

“Well, let’s hope they’re right!” grimly. “If once I get my hands on him—”

He broke off suddenly, as Captain Petersen called out:

“The *Nereid*! There she is!”

Following with their eyes the bright segment cut into the murky depths by his flashlight, they saw the familiar outlines of their craft; and close beside her lay the U-boat.

A feverish activity seemed to be going on between the two submarines.

“They’re changing cargo!” cried Larry. “Quick! We’ve got them now!”

But the progress they were able to make, hampered by their heavy suits, was maddeningly slow. Their searchlights, moreover, betrayed their approach. Before they could reach the scene, most of the sailors had abandoned their task and piled into the U-boat.

Arms swinging wildly, Von Ullrich stood beside it, trying to rally them. Refusing to risk combat, however, since they were unable to use their deadly hand-grenades under water, they continued clambering up the sides of their submersible and shoving down through its conning-tower hatch.

Now a figure in a familiar pressure-suit broke away and started toward the advancing party.

It was Diane!

Even as he recognized her, Larry saw Von Ullrich lunge forward, seize his captive and mount to the conning-tower with her—but before the German could thrust her into the hatch, he had reached the U-boat's side and clambered to her rescue.

Dropping Diane, Von Ullrich wheeled to face his assailant. They grappled, fell to the deck, rolled over and over.

But suddenly, as they were struggling, there came a sound that caused the German to burst free and leap to his feet.

It was the sound of engines under them!

Ignoring Larry now, Von Ullrich staggered to the conning-tower hatch. It was battened fast. Frantically he beat on it.

This much Larry saw, as he knelt there getting his breath. Then he rose, took Diane by the arm and led her down. And he was none too soon, for with a lunge the U-boat got under way.

But she seemed unable to lift her loot-laden mass from the ocean floor, and headed off crazily across the plateau, dragging her keel in the sand.

With fascinated horror, they watched the craft's erratic course, as it swung loggily westward and headed toward that yawning abyss from which they had all so lately risen.

The last sight they had of the U-boat was as it reached the brink, its despairing commander still standing in the conning-tower, hammering vainly on that fast-bound hatch; then they turned away faint, as the doomed craft plunged down, stern up, into those crushing depths.

Professor Stevens now joined them.

"A lesson in avarice," he said gravely, when he had

greeted his daughter with heartfelt relief. "And a typical fate of fortune hunters! Let that be a lesson to you, young man."

"Amen!" said Larry.

"But what happened, my dear?" asked the professor of Diane, a moment later. "Why were they in such a hurry to be off?"

"Because the sensible Antillians seized their opportunity and overcame their guards, while we were below," was her reply. "When we got back, we found the pyramids flooded, so there was nothing else for them to do but go."

So that was the explanation of those gathering, furtive hosts in the lower level, thought Larry. Now he knew what they had been waiting for! They had been waiting for that usurping vandal to depart.

And how they must be gloating now, down there!

"But why were they so eager to abandon the *Nereid*?"

asked the savant, still puzzled. "It it a better boat than theirs, even if I do say so myself."

"Because I put it out of commission, directly we got back up here," replied Diane. "But not permanently!" she added, with what Larry knew was a smile, though he couldn't see her face, of course, through the helmet of her pressure-suit.

"Little thoroughbred!" he exclaimed, half to himself.

"What did you say, Mr. Hunter?—Larry, I mean," she inquired.

"N—nothing," he replied uneasily.

"Fibber!" said Diane. "I heard you the first time!"

"Just wait till I get out of this darned suit!" said Larry.

"I guess I can wait that long!" she told him.

And if Professor Stevens heard any of this, it went in one ear and out the other, for he was thinking what a

report he would have to make to his confrères when they got home—particularly with half a boatload of assorted idols for proof.

#66 The Gate To Xoran, By Hal K. Wells:

A strange man of metal comes to earth on a dreadful mission.

Aproximate word count:

Bigotry:

Warnings:

just as Arlok came through the door

- - -

He sat in a small half-darkened booth well over in the corner—the man with the strangely glowing blue-green eyes.

The booth was one of a score that circled the walls of the “Maori Hut,” a popular night club in the San Fernando Valley some five miles over the hills from Hollywood.

It was nearly midnight. Half a dozen couples danced

lazily in the central dancing space. Other couples remained tête-à-tête in the secluded booths.

In the entire room only two men were dining alone. One was the slender gray-haired little man with the weirdly glowing eyes. The other was Blair Gordon, a highly successful young attorney of Los Angeles. Both men had the unmistakable air of waiting for someone.

Blair Gordon's college days were not so far distant that he had yet lost any of the splendid physique that had made him an All-American tackle. In any physical combat with the slight gray-haired stranger, Gordon knew that he should be able to break the other in two with one hand.

Yet, as he studied the stranger from behind the potted palms that screened his own booth. Gordon was amazed to find himself slowly being overcome by an emotion of dread so intense that it verged upon sheer fear. There was something indescribably alien and utterly sinister in that dimly seen figure in the corner booth.

The faint eery light that glowed in the stranger's deep-set eyes was not the lambent flame seen in the chatoyant orbs of some night-prowling jungle beast. Rather was it the blue-green glow of phosphorescent witch-light that flickers and dances in the night mists above steaming tropical swamps.

The stranger's face was as classically perfect in its rugged outline as that of a Roman war-god, yet those perfect features seemed utterly lifeless. In the twenty minutes that he had been intently watching the stranger, Gordon would have sworn that the other's face had not moved by so much as the twitch of an eye-lash.

Then a new couple entered the Maori Hut, and Gordon promptly forgot all thought of the puzzlingly alien figure in the corner. The new arrivals were a vibrantly beautiful blond girl and a plump, sallow-faced man in the early forties. The girl was Leah Keith, Hollywood's latest screen sensation. The man was Dave Redding, her director.

A waiter seated Leah and her escort in a booth

directly across the room from that of Gordon. It was a maneuver for which Gordon had tipped lavishly when he first came to the Hut.

A week ago Leah Keith's engagement to Blair Gordon had been abruptly ended by a trivial little quarrel that two volatile temperaments had fanned into flames which apparently made reconciliation impossible. A miserably lonely week had finally ended in Gordon's present trip to the Maori Hut. He knew that Leah often came there, and he had an overwhelming longing to at least see her again, even though his pride forced him to remain unseen.

Now, as he stared glumly at Leah through the palms that effectively screened his own booth, Gordon heartily regretted that he had ever come. The sight of Leah's clear fresh beauty merely made him realize what a fool he had been to let that ridiculous little quarrel come between them.

Then, with a sudden tingling thrill, Gordon realized that he was not the only one in the room who was interested in Leah and her escort.

Over in the half-darkened corner booth the eery stranger was staring at the girl with an intentness that made his weird eyes glow like miniature pools of shimmering blue-green fire. Again Gordon felt that vague impression of dread, as though he were in the presence of something utterly alien to all human experience.

Gordon turned his gaze back to Leah, then caught his breath sharply in sudden amaze. The necklace about Leah's throat was beginning to glow with the same uncanny blue-green light that shone in the stranger's eyes! Faint, yet unmistakable, the shimmering radiance pulsed from the necklace in an aura of nameless evil.

And with the coming of that aura of weird light at her throat, a strange trance was swiftly sweeping over Leah. She sat there now as rigidly motionless as some exquisite statue of ivory and jet.

Gordon stared at her in stark bewilderment. He knew the history of Leah's necklace. It was merely an oddity, and nothing more—a freak piece of costume

jewelry made from fragments of an Arizona meteorite. Leah had worn the necklace a dozen times before, without any trace of the weird phenomena that were now occurring.

Dancers again thronged the floor to the blaring jazz of the negro orchestra while Gordon was still trying to force his whirling brain to a decision. He was certain that Leah was in deadly peril of some kind, yet the nature of that peril was too bizarre for his mind to imagine.

Then the stranger with the glowing eyes took matters into his own hands. He left his booth and began threading his way through the dancers toward Leah. As he watched the progress of that slight gray-haired figure Gordon refused to believe the evidence of his own eyes. The thing was too utterly absurd—yet Gordon was positive that the strong oak floor of the dancing space was visibly swaying and creaking beneath the stranger's mincing tread!

The stranger paused at Leah's booth only long enough to utter a brief low-voiced command. Then

Leah, still in the grip of that strange trance, rose obediently from her seat to accompany him.

Dave Redding rose angrily to intercept her. The stranger seemed to barely brush the irate director with his finger tips, yet Redding reeled back as though struck by a pile-driver. Leah and the stranger started for the door. Redding scrambled to his feet again and hurried after them.

It was then that Gordon finally shook off the stupor of utter bewilderment that had held him. Springing from his booth, he rushed after the trio.

The dancers in his way delayed Gordon momentarily. Leah and the stranger were already gone when he reached the door. The narrow little entrance hallway to the Hut was deserted save for a figure sprawled there on the floor near the outer door.

It was the body of Dave Redding. Gordon shuddered as he glanced briefly down at the huddled figure. A single mighty blow from some unknown weapon had crumpled the director's entire face in, like the

shattered shell of a broken egg.

Gordon charged on through the outer door just as a heavy sedan came careening out of the parking lot. He had a flashing glimpse of Leah and the stranger in the front seat of the big car.

Gordon raced for his own machine, a powerful low-slung roadster. A single vicious jab at the starting button, and the big motor leaped into roaring life. Gordon shot out from the parking lot onto the main boulevard. A hundred yards away the sedan was fleeing toward Hollywood.

Gordon tramped hard on the accelerator. His engine snarled with the unleashed fury of a hundred horsepower. The gap between the two cars swiftly lessened.

Then the stranger seemed to become aware for the first time that he was being followed. The next second the big sedan accelerated with the hurtling speed of a flying bullet. Gordon sent his own foot nearly to the floor. The roadster jumped to eighty miles an hour, yet

the sedan continued to leave it remorselessly behind.

The two cars started up the northern slope of Cahuenga Pass with the sedan nearly two hundred yards ahead, and gaining all the time. Gordon wondered briefly if they were to flash down the other side of the Pass and on into Hollywood at their present mad speed.

Then at the summit of the Pass the sedan swerved abruptly to the right and fled west along the Mulholland Highway. Gordon's tires screamed as he swerved the roadster in hot pursuit.

The dark winding mountain highway was nearly deserted at that hour of the night. Save for an occasional automobile that swerved frantically to the side of the road to dodge the roaring onslaught of the racing cars, Gordon and the stranger had the road to themselves.

The stranger seemed no longer to be trying to leave his pursuer hopelessly behind. He allowed Gordon to come within a hundred yards of him. But that was as

near as Gordon could get, in spite of the roadster's best efforts.

Half a dozen times Gordon trod savagely upon his accelerator in a desperate attempt to close the gap, but each time the sedan fled with the swift grace of a scudding phantom. Finally Gordon had to content himself with merely keeping his distance behind the glowing red tail-light of the car ahead.

They passed Laurel Canyon, and still the big sedan bored on to the west. Then finally, half a dozen miles beyond Laurel Canyon, the stranger abruptly left the main highway and started up a narrow private road to the crest of one of the lonely hills. Gordon slowly gained in the next two miles. When the road ended in a winding gravelled driveway into the grounds of what was apparently a private estate, the roadster was scarcely a dozen yards behind.

The stranger's features as he stood there stiffly erect in the vivid glare of the roadster's headlights were still as devoid of all expression as ever. The only things that really seemed alive in that masque of a

face were the two eyes, glowing eery blue-green fire like twin entities of alien evil.

Gordon wasted no time in verbal sparring. He motioned briefly to Leah Keith's rigid form in the front seat of the sedan.

"Miss Keith is returning to Hollywood with me," he said curtly. "Will you let her go peaceably, or shall I —?" He left the question unfinished, but its threat was obvious.

"Or shall you do what?" asked the stranger quietly. There was an oddly metallic ring in his low even tones. His words were so precisely clipped that they suggested some origin more mechanical than human.

"Or shall I take Miss Keith with me by force?" Gordon flared angrily.

"You can try to take the lady by force—if you wish." There was an unmistakable jeering note in the metallic tones.

The taunt was the last thing needed to unleash Gordon's volatile temper. He stepped forward and swung a hard left hook for that expressionless masque of a face. But the blow never landed. The stranger dodged with uncanny swiftness. His answering gesture seemed merely the gentlest possible push with an outstretched hand, yet Gordon was sent reeling backward a full dozen steps by the terrific force of that apparently gentle blow.

Recovering himself, Gordon grimly returned to the attack. The stranger again flung out one hand in the contemptuous gesture with which one would brush away a troublesome fly, but this time Gordon was more cautious. He neatly dodged the stranger's blow, then swung a vicious right squarely for his adversary's unprotected jaw.

The blow smashed solidly home with all of Gordon's weight behind it. The stranger's jaw buckled and gave beneath that shattering impact. Then abruptly his entire face crumpled into distorted ruin. Gordon staggered back a step in sheer horror at the gruesome result of his blow.

The stranger flung a hand up to his shattered features. When his hand came away again, his whole face came away with it!

Gordon had one horror-stricken glimpse of a featureless blob of rubbery bluish-gray flesh in which fiendish eyes of blue-green fire blazed in malignant fury.

Then the stranger fumbled at his collar, ripping the linen swiftly away. Something lashed out from beneath his throat—a loathsome snake-like object, slender and forked at the end. For one ghastly moment, as the writhing tentacle swung into line with him, Gordon saw its forked ends glow strange fire—one a vivid blue, the other a sparkling green.

Then the world was abruptly blotted out for Blair Gordon.

Consciousness returned to Gordon as swiftly and painlessly as it had left him. For a moment he blinked stupidly in a dazed effort to comprehend the incredible scene before him.

He was seated in a chair over near the wall of a large room that was flooded with livid red light from a single globe overhead. Beside him sat Leah Keith, also staring with dazed eyes in an effort to comprehend her surroundings. Directly in front of them stood a figure of stark nightmare horror.

The weirdly glowing eyes identified the figure as that of the stranger at the Maori Hut, but there every point of resemblance ceased. Only the cleverest of facial masques and body padding could ever have enabled this monstrosity to pass unnoticed in a world of normal human beings.

Now that his disguise was completely stripped away, his slight frame was revealed as a grotesque parody of that of a human being, with arms and legs like pipe-stems, a bald oval head that merged with neckless rigidity directly into a heavy-shouldered body that tapered into an almost wasp-like slenderness at the waist. He was naked save for a loin cloth of some metallic fabric. His bluish-gray skin had a dull oily sheen strangely suggestive of fine grained flexible metal.

The creature's face was hideously unlike anything human. Beneath the glowing eyes was a small circular mouth orifice with a cluster of gill-like appendages on either side of it. Patches of lighter-colored skin on either side of the head seemed to serve as ears. From a point just under the head, where the throat of a human being would have been, dangled the foot-and-a-half long tentacle whose forked tip had sent Gordon into oblivion.

Behind the creature Gordon was dimly aware of a maze of complicated and utterly unfamiliar apparatus ranged along the opposite wall, giving the room the appearance of being a laboratory of some kind.

Gordon's obvious bewilderment seemed to amuse the bluish-gray monstrosity. "May I introduce myself?" he asked with a mocking note in his metallic voice. "I am Arlok of Xoran. I am an explorer of Space, and more particularly an Opener of Gates. My home is upon Xoran, which is one of the eleven major planets that circle about the giant blue-white sun that your astronomers call Rigel. I am here to open the Gate between your world and mine."

Gordon reached a reassuring hand over to Leah. All memory of their quarrel was obliterated in the face of their present peril. He felt her slender fingers twine firmly with his. The warm contact gave them both new courage.

“We of Xoran need your planet and intend to take possession of it,” Arlok continued, “but the vast distance which separates Rigel from your solar system makes it impracticable to transport any considerable number of our people here in space-cars for, though our space-cars travel with practically the speed of light, it requires over five hundred and forty years for them to cross that great void. So I was sent as a lone pioneer to your Earth to do the work necessary here in order to open the Gate that will enable Xoran to cross the barrier in less than a minute of your time.

“That gate is the one through the fourth dimension, for Xoran and your planet in a four-dimensional universe are almost touching each other in spite of the great distance separating them in a three-dimensional universe. We of Xoran, being three-

dimensional creatures like you Earthlings, can not even exist on a four-dimensional plane. But we can, by the use of apparatus to open a Gate, pass through a thin sector of the fourth dimension and emerge in a far distant part of our three-dimensional universe.

“The situation of our two worlds,” Arlok continued, “is somewhat like that of two dots on opposite ends of a long strip of paper that is curved almost into a circle. To two-dimensional beings capable only of realizing and traveling along the two dimensions of the paper itself those dots might be many feet apart, yet in the third dimension straight across free space they might be separated by only the thousandth part of an inch. In order to take that short cut across the third dimension the two-dimensional creatures of the paper would have only to transform a small strip of the intervening space into a two-dimensional surface like their paper.

“They could, do this, of course, by the use of proper vibration-creating machinery, for all things in a material universe are merely a matter of vibration. We of Xoran plan to cross the barrier of the fourth

dimension by creating a narrow strip of vibrations powerful enough to exactly match and nullify those of the fourth dimension itself. The result will be that this narrow strip will temporarily become an area of three dimensions only, an area over which we can safely pass from our world to yours.”

Arlok indicated one of the pieces of apparatus along the opposite wall of the room. It was an intricate arrangement of finely wound coils with wires leading to scores of needle-like points which constantly shimmered and crackled with tiny blue-white flames. Thick cables ran to a bank of concave reflectors of some gleaming grayish metal.

“There is the apparatus which will supply the enormous power necessary to nullify the vibrations of the fourth dimensional barrier,” Arlok explained. “It is a condenser and adapter of the cosmic force that you call the Millikan rays. In Xoran a similar apparatus is already set up and finished, but the Gate can only be opened by simultaneous actions from both sides of the barrier. That is why I was sent on my long journey through space to do the necessary work here. I am

now nearly finished. A very few hours more will see the final opening of the Gate. Then the fighting hordes of Xoran can sweep through the barrier and overwhelm your planet.

“When the Gate from Xoran to a new planet is first opened,” Arlok continued, “our scientists always like to have at least one pair of specimens of the new world’s inhabitants sent through to them for experimental use. So to-night, while waiting for one of my final castings to cool, I improved the time by making a brief raid upon the place that you call the Maori Hut. The lady here seemed an excellent type of your Earthling women, and the meteoric iron in her necklace made a perfect focus for electric hypnosis. Her escort was too inferior a specimen to be of value to me so I killed him when he attempted to interfere. When you gave chase I lured you on until I could see whether you might be usable. You proved an excellent specimen, so I merely stunned you. Very soon now I shall be ready to send the two of you through the Gate to our scientists in Xoran.”

A cold wave of sheer horror swept over Gordon. It

was impossible to doubt the stark and deadly menace promised in the plan of this grim visitor from an alien universe—a menace that loomed not only for Gordon and Leah but for the teeming millions of a doomed and defenseless world.

“Let me show you Xoran,” Arlok offered. “Then you may be better able to understand.” He turned his back carelessly upon his two captives and strode over to the apparatus along the opposite wall.

Gordon longed to hurl himself upon the unprotected back of the retreating Xoranian, but he knew that any attempt of that kind would be suicidal. Arlok’s deadly tentacle would strike him down before he was halfway across the room.

He searched his surroundings with desperate eyes for anything that might serve as a weapon. Then his pulse quickened with sudden hope. There on a small table near Leah was the familiar bulk of a .45 calibre revolver, loaded and ready for use. It was included in a miscellaneous collection of other small earthly tools and objects that Arlok had apparently collected for

study.

There was an excellent chance that Leah might be able to secure the gun unobserved. Gordon pressed her fingers in a swift attempt at signalling, then jerked his head ever so slightly toward the table. A moment later the quick answering pressure of Leah's fingers told him that she had understood his message. From the corner of his eye Gordon saw Leah's other hand begin cautiously groping behind her for the revolver.

Then both Gordon and Leah froze into sudden immobility as Arlok faced them again from beside an apparatus slightly reminiscent of an earthly radio set. Arlok threw a switch, and a small bank of tubes glowed pale green. A yard-square plate of bluish-gray metal on the wall above the apparatus glowed with milky fluorescence.

"It is easy to penetrate the barrier with light waves," Arlok explained. "That is a Gate that can readily be opened from either side. It was through it that we first discovered your Earth."

Arlok threw a rheostat on to more power. The luminous plate cleared swiftly. "And there, Earthlings, is Xoran!" Arlok said proudly.

Leah and Gordon gasped in sheer amaze as the glowing plate became a veritable window into another world—a world of utter and alien terror.

The livid light of a giant red sun blazed mercilessly down upon a landscape from which every vestige of animal and plant life had apparently been stripped. Naked rocks and barren soil stretched illimitably to the far horizon in a vast monotony of utter desolation.

Arlok twirled the knob of the apparatus, and another scene flashed into view. In this scene great gleaming squares and cones of metal rose in towering clusters from the starkly barren land. Hordes of creatures like Arlok swarmed in and around the metal buildings. Giant machines whirled countless wheels in strange tasks. From a thousand great needle-like projections on the buildings spurted shimmering sheets of crackling flame, bathing the entire scene in a whirling mist of fiery vapors.

Gordon realized dimly that he must be looking into one of the cities of Xoran, but every detail of the chaotic whirl of activity was too utterly unfamiliar to carry any real significance to his bewildered brain. He was as hopelessly overwhelmed as an African savage would be if transported suddenly into the heart of Times Square.

Arlok again twirled the knob. The scene shifted, apparently to another planet. This world was still alive, with rich verdure and swarming millions of people strangely like those of Earth. But it was a doomed world. The dread Gate to Xoran had already been opened here. Legions of bluish-gray Xorans were attacking the planet's inhabitants, and the attack of those metallic hosts was irresistible.

The slight bodies of the Xorans seemed as impervious to bullets and missiles as though armor-plated. The frantic defense of the beleaguered people of the doomed planet caused hardly a casualty in the Xorans' ranks.

The attack of the Xorans was hideously effective.

Clouds of dense yellow fog belched from countless projectors in the hands of the bluish-gray hosts, and beneath that deadly miasma all animal and plant life on the doomed planet was crumbling, dying, and rotting into a liquid slime. Then even the slime was swiftly obliterated, and the Xoranians were left triumphant upon a world starkly desolate.

“That was one of the minor planets in the swarm that make up the solar system of the sun that your astronomers call Canopus,” Arlok explained. “Our first task in conquering a world is to rid it of the unclean surface scum of animal and plant life. When this noxious surface mold is eliminated, the planet is then ready to furnish us sustenance, for we Xoranians live directly upon the metallic elements of the planet itself. Our bodies are of a substance of which your scientists have never even dreamed—deathless, invincible, living metal!”

Arlok again twirled the control of the apparatus and the scene was shifted back to the planet of Xoran, this time to the interior of what was apparently a vast laboratory. Here scores of Xoranian scientists were

working upon captives who were pathetically like human beings of Earth itself, working with lethal gases and deadly liquids as human scientists might experiment upon noxious pests. The details of the scene were so utterly revolting, the tortures that were being inflicted so starkly horrible, that Leah and Gordon sank back in their chairs sick and shaken.

Arlok snapped off a switch, and the green light in the tubes died. "That last scene was the laboratory to which I shall send you two presently," he said callously as he started back across the room toward them.

Gordon lurched to his feet, his brain a seething whirl of hate in which all thought of caution was gone as he tensed his muscles to hurl himself upon that grim monstrosity from the bleak and desolate realm of Xoran.

Then he felt Leah tugging surreptitiously at his right hand. The next moment the bulk of something cold and hard met his fingers. It was the revolver. Leah had secured it while Arlok was busy with his inter-

dimensional televisor.

Arlok was rapidly approaching them. Gordon hoped against hope that the menace of that deadly tentacle might be diverted for the fraction of a second necessary for him to get in a crippling shot. Leah seemed to divine his thought. She suddenly screamed hysterically and flung herself on the floor almost at Arlok's feet.

Arlok stopped in obvious wonder and bent over Leah. Gordon took instant advantage of the Xoranian's diverted attention. He whipped the revolver from behind him and fired point-blank at Arlok's unprotected head.

The bullet struck squarely, but Arlok was not even staggered. A tiny spot of bluish-gray skin upon his oval skull gleamed faintly for a moment under the bullet's impact. Then the heavy pellet of lead, as thoroughly flattened as though it had struck the triple armor of a battleship, dropped spent and harmless to the floor.

Arlok straightened swiftly. For the moment he seemed to have no thought of retaliating with his deadly tentacle. He merely stood there quite still with one thin arm thrown up to guard his glowing eyes.

Gordon sent the remainder of the revolver's bullets crashing home as fast as his finger could press the trigger. At that murderously short range the smashing rain of lead should have dropped a charging gorilla. But for all the effect Gordon's shots had upon the Xoranian, his ammunition might as well have been pellets of paper. Arlok's glossy hide merely, glowed momentarily in tiny patches as the bullets struck and flattened harmlessly—and that was all.

His last cartridge fired, Gordon flung the empty weapon squarely at the blue monstrosity's hideous face. Arlok made no attempt to dodge. The heavy revolver struck him high on the forehead, then rebounded harmlessly to the floor. Arlok paid no more attention to the blow than a man would to the casual touch of a wind-blown feather.

Gordon desperately flung himself forward upon the

Xoranian in one last mad effort to overwhelm him. Arlok dodged Gordon's wild blows, then gently swept the Earth man into the embrace of his thin arms. For one helpless moment Gordon sensed the incredible strength and adamant hardness of the Xoranian's slender figure, together with an overwhelming impression of colossal weight in that deceptively slight body.

Then Arlok contemptuously flung Gordon away from him. As Gordon staggered backward, Arlok's tentacle lashed upward and levelled upon him. Its twin tips again glowed brilliant green and livid blue. Instantly every muscle in Gordon's body was paralyzed. He stood there as rigid as a statue, his body completely deadened from the neck down. Beside him stood Leah, also frozen motionless in that same weird power.

"Earthling, you are beginning to try my patience," Arlok snapped. "Can you not realize that I am utterly invincible in any combat with you? The living metal of my body weighs over sixteen hundred pounds, as you measure weight. The strength inherent in that metal

is sufficient to tear a hundred of your Earth men to shreds. But I do not even have to touch you to vanquish you. The electric content of my bodily structure is so infinitely superior to yours that with this tentacle-organ of mine I can instantly short-circuit the feeble currents of your nerve impulses and bring either paralysis or death as I choose.

“But enough of this!” Arlok broke off abruptly. “My materials are now ready, and it is time that I finished my work. I shall put you out of my way for a few hours until I am ready to send you through the Gate to the laboratories of Xoran.”

The green and blue fire of the tentacle’s tips flamed to dazzling brightness. The paralysis of Gordon’s body swept swiftly over his brain. Black oblivion engulfed him.

When Gordon again recovered consciousness he found that he was lying on the floor of what was apparently a narrow hall, near the foot of a stairway. His hands were lashed tightly behind him, and his feet and legs were so firmly pinioned together that he

could scarcely move.

Beside him lay Leah, also tightly bound. A short distance down the hall was the closed door of Arlok's work-room, recognizable by the thin line of red light gleaming beneath it.

Moonlight through a window at the rear of the hall made objects around Gordon fairly clear. He looked at Leah and saw tears glistening on her long lashes.

"Oh, Blair, I was afraid you'd never waken again," the girl sobbed. "I thought that fiend had killed you!" Her voice broke hysterically.

"Steady, darling," Gordon said soothingly. "We simply can't give up now, you know. If that monstrosity ever opens that accursed Gate of his our entire world is doomed. There must be some way to stop him. We've got to find that way and try it—even if it seems only one forlorn chance in a million."

Gordon shook his head to clear the numbness still lingering from the effect of Arlok's tentacle. The

Xoranian seemed unable to produce a paralysis of any great duration with his weird natural weapon.

Accordingly, he had been forced to bind his captives like two trussed fowls while he returned to his labors.

Lying close together as they were, it was a comparatively easy matter for them to get their bound hands within reach of each other, but after fifteen minutes of vain work Gordon realized that any attempt at untying the ropes was useless. Arlok's prodigious strength had drawn the knots so tight that no human power could ever loosen them.

Then Gordon suddenly thought of the one thing in his pockets that might help them. It was a tiny cigarette lighter, of the spring-trigger type. It was in his vest pocket completely out of reach of his bound hands, but there was a way out of that difficulty.

Gordon and Leah twisted and rolled their bodies like two contortionists until they succeeded in getting into such a position that Leah was able to get her teeth in the cloth of the vest pocket's edge. A moment of desperate tugging, then the fabric gave way. The

lighter dropped from the torn pocket to the floor, where Leah retrieved it.

Then they twisted their bodies back to back. Leah managed to get the lighter flaming in her bound hands. Gordon groped in an effort to guide the ropes on his wrists over the tiny flickering flame.

Then there came the faint welcome odor of smoldering rope as the lighter's tiny flame bit into the bonds. Gordon bit his lips to suppress a cry of pain as the flame seared into his skin as well. The flame bit deeper into the rope. A single strand snapped.

Then another strand gave way. To Gordon the process seemed endless as the flame scorched rope and flesh alike. A long minute of lancing agony that seemed hours—then Gordon could stand no more. He tensed his muscles in one mighty agonized effort to end the torture of the flame.

The weakened rope gave way completely beneath that pain-maddened lunge. Gordon's hands were free. It was an easy matter now to use the lighter to finish

freeing himself and Leah. They made their way swiftly back to the window at the rear of the hall. It slid silently upward. A moment later, and they were out in the brilliant moonlight—free.

They made their way around to the front of the house. Behind the drawn shades of one of the front rooms an eery glow of red light marked the location of Arlok's work-room. They heard the occasional clink of tools inside the room as the Xoranian diligently worked to complete his apparatus.

They crept stealthily up to where one of the French windows of Arlok's work-room swung slightly ajar. Through the narrow crevice they could see Arlok's grotesque back as he labored over the complex assembly of apparatus against the wall.

A heavy stone flung through the window would probably wreck that delicate mechanism completely, yet the two watchers knew that such a respite would be only a temporary one. As long as Arlok remained alive on this planet to build other gates to Xoran, Earth's eventual doom was certain. Complete

destruction of Arlok himself was Earth's only hope of salvation.

The Xoranian seemed to be nearing the end of his labors. He left the apparatus momentarily and walked over to a work-bench where he picked up a slender rod-like tool. Donning a heavy glove to shield his left hand, he selected a small plate of bluish-gray metal, then pressed a switch in the handle of the tool in his right hand.

A blade of blinding white flame, seemingly as solid as a blade of metal, spurted for the length of a foot from the tool's tip. Arlok began cutting the plate with the flame, the blade shearing through the heavy metal as easily as a hot knife shears through butter.

The sight brought a sudden surge of exultant hope to Gordon. He swiftly drew Leah away from the window, far enough to the side that their low-voiced conversation could not be heard from inside the work-room.

"Leah, there is our one chance!" he explained

excitedly. “That blue fiend *is* vulnerable, and that flame-tool of his is the weapon to reach his vulnerability. Did you notice how careful he was to shield his other hand with a glove before he turned the tool on? He can be hurt by that blade of flame, and probably hurt badly.”

Leah nodded in quick understanding. “If I could lure him out of the room for just a moment, you could slip in through the window and get that flame-tool, Blair,” she suggested eagerly.

“That might work,” Gordon agreed reluctantly. “But, Leah, don’t run any more risks than you absolutely have to!” He picked up a small rock. “Here, take this with you. Open the door into the hall and attract Arlok’s attention by throwing the rock at his precious apparatus. Then the minute he sees you, try to escape out through the hall again. He’ll leave his work to follow you. When he returns to his work-room I’ll be in there waiting for him. And I’ll be waiting with a weapon that can stab through even that armor-plated hide of his!”

They separated, Leah to enter the house, Gordon to return to the window.

Arlok was back over in front of the apparatus, fitting into place the piece of metal he had just cut. The flame-tool, its switch now turned off, was still on the work-bench.

Gordon's heart pounded with excitement as he crouched there with his eyes fixed upon the closed hall door. The minutes seemed to drag interminably. Then suddenly Gordon's muscles tensed. The knob of the hall door had turned ever so slightly. Leah was at her post!

The next moment the door was flung open with a violence that sent it slamming back against the wall. The slender figure of Leah stood framed in the opening, her dark eyes blazing as she flung one hand up to hurl her missile.

Arlok whirled just as Leah threw the rock straight at the intricate Gate-opening apparatus. With the speed of thought the Xoranian flung his own body over to

shield his fragile instruments. The rock thudded harmlessly against his metallic chest.

Then Arlok's tentacle flung out like a striking cobra, its forked tip flaming blue and green fire as it focussed upon the open door. But Leah was already gone. Gordon heard her flying footsteps as she raced down the hall. Arlok promptly sped after her in swift pursuit.

As Arlok passed through the door into the hall Gordon flung himself into the room, and sped straight for the work-bench. He snatched the flame-tool up, then darted over to the wall by the door. He was not a second too soon. The heavy tread of Arlok's return was already audible in the hall just outside.

Gordon prepared to stake everything upon his one slim chance of disabling that fearful tentacle before Arlok could bring it into action. He pressed the tiny switch in the flame-tool's handle just as Arlok came through the door.

Arlok, startled by the glare of the flame-tool's blazing

blade, whirled toward Gordon—but too late. That thin searing shaft of vivid flame had already struck squarely at the base of the Xoranian's tentacle. A seething spray of hissing sparks marked the place where the flame bit deeply home. Arlok screamed, a ghastly metallic note of anguish like nothing human.

The Xoranian's powerful hands clutched at Gordon, but he leaped lithely backward out of their reach. Then Gordon again attacked, the flame-tool's shining blade licking in and out like a rapier. The searing flame swept across one of Arlok's arms, and the Xoranian winced. Then the blade stabbed swiftly at Arlok's waist. Arlok half-doubled as he flinched back. Gordon shifted his aim with lightning speed and sent the blade of flame lashing in one accurate terrible stroke that caught Arlok squarely in the eyes.

Again Arlok screamed in intolerable agony as that tearing flame darkened forever his glowing eyes. In berserker fury the tortured Xoranian charged blindly toward Gordon. Gordon warily dodged to one side. Arlok, sightless, and with his tentacle crippled, still had enough power in that mighty metallic body of his

to tear a hundred Earth men to pieces.

Gordon stung Arlok's shoulder with the flame, then desperately leaped to one side just in time to dodge a flailing blow that would have made pulp of his body had it landed.

Arlok went stark wild in his frenzied efforts to come to grips with his unseen adversary. Furniture crashed and splintered to kindling wood beneath his threshing feet. Even the stout walls of the room shivered and cracked as the incredible weight of Arlok's body caromed against them.

Gordon circled lithely around the crippled blue monstrosity like a timber wolf circling a wounded moose. He began concentrating his attack upon Arlok's left leg. Half a dozen deep slashes with the searing flame—then suddenly the thin leg crumpled and broke. Arlok crashed helplessly to the floor.

Gordon was now able to shift his attack to Arlok's head. Dodging the blindly flailing arms of the Xoranian, he stabbed again and again at that oval-

shaped skull.

The searing thrusts began to have their effect. Arlok's convulsive movements became slower and weaker. Gordon sent the flame stabbing in a long final thrust in an attempt to pierce through to that alien metal brain.

With startling suddenness the flame burned its way home to some unknown center of life force in the oval skull. There was a brief but appalling gush of bright purple flame from Arlok's eye-sockets and mouth orifice. Then his twitching body stiffened. His bluish-gray hide darkened with incredible swiftness into a dull black. Arlok was dead.

Gordon, sickened at the grisly ending to the battle, snapped off the flame-tool and turned to search for Leah. He found her already standing in the hall door, alive, and unhurt.

"I escaped through the window at the end of the hall," she explained. "Arlok quit following me as soon as he saw that you too were gone from where he had left us

“tied.” She shuddered as she looked down at the Xoranian’s mangled body. “I saw most of your fight with him, Blair. It was terrible; awful. But, Blair, we’ve won!”

“Yes, and now we’ll make sure of the fruits of our victory,” Gordon said grimly, starting over toward the Gate-opening apparatus with the flame-tool in his hand. A very few minutes’ work with the shearing blade of flame reduced the intricate apparatus to a mere tangled pile of twisted metal.

Arlok, Gate-opener of Xoran, was dead—and the Gate to that grim planet was now irrevocably closed!

“Blair, do you feel it too, that eery feeling of countless eyes still watching us from Xoran?” There was frank awe in Leah’s half-whispered question. “You know Arlok said that they had watched us for centuries from their side of the barrier. I’m sure they’re watching us now. Will they send another Opener of Gates to take up the work where Arlok failed?”

Gordon took Leah into his arms. “I don’t know, dear,”

he admitted gravely. "They may send another messenger, but I doubt it. This world of ours has had its warning, and it will heed it. The watchers on Xoran must know that in the five hundred and forty years it would take their next messenger to get here, the Earth will have had more than enough time to prepare an adequate defense for even Xoran's menace. I doubt if there will ever again be an attempt made to open the Gate to Xoran."

#67 The Eye Of Allah, By Charles Willard Diffin:

On the fatal seventh of September a certain secret service man sat in the president's chair and—looked back into the Eye of Allah.

Aproximate word count: 8,100

Bigotry: The islamomisia is pretty implicit from the title.

Warnings:

The great ship tore apart

- - -

On the fatal seventh of September a certain Secret Service man sat in the President's chair and—looked back into the Eye of Allah.

Blinky Collins' part in this matter was very brief. Blinky lasted just long enough to make a great discovery, to brag about it as was Blinky's way, and then pass on to find his reward in whatever hereafter is set apart for weak-minded crooks whose heads are not hard enough to withstand the crushing impact of a lead-filled pacifier.

The photograph studio of Blinky Collins was on the third floor of a disreputable building in an equally unsavory part of Chicago. There were no tinted pictures of beautiful blondes nor of stern, square-jawed men of affairs in Blinky's reception room. His clients, who came furtively there, were strongly opposed to having their pictures taken—they came for other purposes. For the photographic work of Mr. Collins was strictly commercial—and peculiar. There were fingerprints to be photographed and identified

for purpose of private revenge, photographs of people to be merged and repictured in compromising closeness for reasons of blackmail. And even X-Ray photography was included in the scope of his work.

The great discovery came when a box was brought to the dingy room and Mr. Collins was asked to show what was inside it without the bother and inconvenience of disturbing lock and seals. The X-Ray machine sizzled above it, and a photographic plate below was developed to show a string of round discs that could easily have been pearls.

The temporary possessor of the box was pleased with the result—but Blinky was puzzled. For the developer had brought out an odd result. There were the pearls as expected, but, too, there was a small picture superimposed—a picture of a bald head and a body beneath seated beside a desk. The picture had been taken from above looking straight down, and head and desk were familiar.

Blinky knew them both. The odd part was that he knew also that both of them were at that instant on

the ground floor of the same disreputable building, directly under and two floors below his workshop.

Like many great discoveries, this of Blinky's came as the result of an accident. He had monkeyed with the X-Ray generator and had made certain substitutions. And here was the result—a bald head and a desk, photographed plainly through two heavy wood floors. Blinky scratched his own head in deep thought. And then he repeated the operation.

This time there was a blonde head close to the bald one, and two people were close to the desk and to each other. Blinky knew then that there were financial possibilities in this new line of portrait work.

It was some time before the rat eyes of the inventor were able to see exactly what they wanted through this strange device, but Blinky learned. And he fitted a telescope back of the ray and found that he could look along it and see as if through a great funnel what was transpiring blocks and blocks away; he looked where he would, and brick walls or stone were like glass when the new ray struck through them.

Blinky never knew what he had—never dreamed of the tremendous potentialities in his oscillating ethereal ray that had a range and penetration beyond anything known. But he knew, in a vague way, that this ray was a channel for light waves to follow, and he learned that he could vary the range of the ray and that whatever light was shown at the end of that range came to him as clear and distinct as if he were there in the room.

He sat for hours, staring through the telescope. He would train the device upon a building across the street, then cut down the current until the unseen vibration penetrated inside the building. If there was nothing there of interest he would gradually increase the power, and the ray would extend out and still out into other rooms and beyond them to still others. Blinky had a lot of fun, but he never forgot the practical application of the device—practical, that is, from the distorted viewpoint of a warped mind.

“I’ve heard about your machine,” said a pasty-faced man one day, as he sat in Blinky’s room, “and I think it’s a lot of hooey. But I’d give just one grand to know

who is with the district attorney this minute.”

“Where is he?” asked Blinky.

“Two blocks down the street, in the station house ... and if Pokey Barnard is with him, the lousy stool-pigeon—”

Blinky paid no attention to the other’s opinion of one Pokey Barnard; he was busy with a sputtering blue light and a telescope behind a shield of heavy lead.

“Put your money on the table,” he said, finally:
“there’s the dicks ... and there’s Pokey. Take a look—”

It was some few minutes later that Blinky learned of another valuable feature in his ray. He was watching the district attorney when the pasty-faced man brushed against a hanging incandescent light. There was a bit of bare wire exposed, and as it swung into the ray the fuses in the Collins studio blew out instantly.

But the squinting eyes at the telescope had seen

something first. They had seen the spare form of the district attorney throw itself from the chair as if it had been dealt a blow—or had received an electric shock.

Blinky put in new fuses—heavier ones—and tried it again on another subject. And again the man at the receiving end got a shot of current that sent him sprawling.

“Now what the devil—” demanded Blinky. He stood off and looked at the machine, the wire with its 110 volts, the invisible ray that was streaming out.

“It’s insulated, the machine is,” he told his caller, “so the juice won’t shoot back if I keep my hands off; but why,” he demanded profanely, “don’t it short on the first thing it touches?”

He was picturing vaguely a ray like a big insulated cable, with light and current both traveling along a core at its center, cut off, insulated by the ray, so that only the bare end where the ray stopped could make contact.

“Some more of them damn electrons.” he hazarded; then demanded of his caller: “But am I one hell of a smart guy? Or am I?”

There was no denying this fact. The pasty-faced man told Blinky with lurid emphasis just how smart. He had seen with his own eyes and this was too good to keep.

He paid his one grand and departed, first to make certain necessary arrangements for the untimely end of one Pokey Barnard, squealer, louse, et cetera, et cetera, and then to spread the glad news through the underworld of Collins’ invention.

That was Blinky’s big mistake, as was shown a few days later. Not many had taken seriously the account of the photographer’s experiments, but there was one who had, as was evident. A bearded man, whose eyes stared somewhat wildly from beneath a shock of frowzy hair, entered the Collins work-room and locked the door behind him. His English was imperfect, but the heavy automatic in his hand could not be misunderstood. He forced the trembling inventor to

give a demonstration, and the visitor's face showed every evidence of delight.

"The cur-rent," he demanded with careful words, "the electreek cur-rent, you shall do also. Yes?"

Again the automatic brought quick assent, and again the visitor showed his complete satisfaction. Showed it by slugging the inventor quietly and efficiently and packing the apparatus in the big suitcase he had brought.

Blinky Collins had been fond of that machine. He had found a form of television with uncounted possibilities, and it had been for him the perfect instrument of a blackmailing Peeping Tom; he had learned the secret of directed wireless transmission of power and had seen it as a means for annoying his enemies. Yet Blinky Collins—the late Blinky Collins—offered no least objection, when the bearded man walked off with the machine. His body, sprawled awkwardly in the corner, was quite dead....

And now, some two months later, in his Washington

office, the Chief of the United States Secret Service pushed a paper across his desk to a waiting man and leaned back in his chair.

“What would you make of that, Del?” he asked.

Robert Delamater reached leisurely for the paper. He regarded it with sleepy, half-closed eyes.

There was a crude drawing of an eye at the top. Below was printed—not written—a message in careful, precise letters: “Take warning. The Eye of Allah is upon you. You shall instructions receive from time to time. Follow them. Obey.”

Delamater laughed. “Why ask me what I think of a nut letter like that. You’ve had plenty of them just as crazy.”

“This didn’t come to me,” said the Chief; “it was addressed to the President of the United States.”

“Well, there will be others, and we will run the poor sap down. Nothing out of the ordinary I should say.”

“That is what I thought—at first. Read this—” The big, heavy-set man pushed another and similar paper across the desk. “This one was addressed to the Secretary of State.”

Delamater did not read it at once. He held both papers to the light; his fingers touched the edges only.

“No watermark,” he mused; “ordinary white writing stock—sold in all the five and ten cent stores. Tried these for fingerprints I suppose?”.

“Read it,” suggested the Chief.

“Another picture of an eye,” said Delamater aloud, and read: “‘Warning. You are dealing with an emissary from a foreign power who is an unfriend of my country. See him no more. This is the first and last warning. The Eye of Allah watches.’”

“And what is this below—? ‘He did not care for your cigars, Mr. Secretary. Next time—but there must be no next time.’”

Delamater read slowly—lazily. He seemed only slightly interested except when he came to the odd conclusion of the note. But the Chief knew Delamater and knew how that slow indolence could give place to a feverish, alert concentration when work was to be done.

“Crazy as a loon,” was the man’s conclusion as he dropped the papers upon the desk.

“Crazy,” his chief corrected, “like a fox! Read the last line again; then get this—

“The Secretary of State *is* meeting with a foreign agent who is here very much incog. Came in as a servant of a real ambassador. Slipped quietly into Washington, and not a soul knew he was here. He met the Secretary in a closed room; no one saw him come or leave—”;

“Well, the Secretary tells me that in that room where nobody could see he offered this man a cigar. His visitor took it, tried to smoke it, apologized—and lit one of his own vile cigarettes.”

“Hm-m!” Delamater sat a little straighter in his chair; his eyebrows were raised now in questioning astonishment. “Dictaphone? Some employee of the Department listening in?”

“Impossible.”

“Now that begins to be interesting,” the other conceded. His eyes had lost their sleepy look. “Want me to take it on?”

“Later. Right now. I want you to take this visiting gentleman under your personal charge. Here is the name and the room and hotel where he is staying. He is to meet with the Secretary to-night—he knows where. You will get to him unobserved—absolutely unseen; I can leave that to you. Take him yourself to his appointment, and take him without a brass band. But have what men you want tail you and watch out for spies.... Then, when he is through, bring him back and deliver him safely to his room. Compray?”

“Right—give me Wilkins and Smeed. I rather think I can get this bird there and back without being seen,

but perhaps they may catch Allah keeping tabs on us at that.” He laughed amusedly as he took the paper with the name and address.

A waiter with pencil and order-pad might have been seen some hours later going as if from the kitchen to the ninth floor of a Washington hotel. And the same waiter, a few minutes later, was escorting a guest from a rear service-door to an inconspicuous car parked nearby. The waiter slipped behind the wheel.

A taxi, whose driver was half asleep, was parked a hundred feet behind them at the curb. As they drove away and no other sign of life was seen in the quiet street the driver of the taxi yawned ostentatiously and decided to seek a new stand. He neglected possible fares until a man he called Smeed hailed him a block farther on. They followed slowly after the first car ... and they trailed it again on its return after some hours.

“Safe as a church,” they reported to the driver of the first car. “We’ll swear that nobody was checking up on that trip.”

And: "O. K." Delamater reported to his chief the next morning. "Put one over on this self-appointed Allah that time."

But the Chief did not reply: he was looking at a slip of paper like those he had shown his operative the day before. He tossed it to Delamater and took up the phone.

"To the Secretary of State," Delamater read. "You had your warning. Next time you disobey it shall be you who dies."

The signature was only the image of an eye.

The Chief was calling a number; Delamater recognized it as that of the hotel he had visited.

"Manager, please, at once," the big man was saying.

He identified himself to the distant man. Then:

"Please check up on the man in nine four seven. If he doesn't answer, enter the room and report at once—I will hold the phone...."

The man at the desk tapped steadily with a pencil; Robert Delamater sat quietly, tensely waiting. But some sixth sense told him what the answer would be. He was not surprised when the Chief repeated what the phone had whispered.

“Dead?... Yes!... Leave everything absolutely undisturbed. We will be right over.”

“Get Doctor Brooks, Del,” he said quietly; “the Eye of Allah was watching after all.”

Robert Delamater was silent as they drove to the hotel. Where had he slipped? He trusted Smeed and Wilkins entirely; if they said his car had not been followed it had not. And the visitor had been disguised; he had seen to that. Then, where had this person stood—this being who called himself the Eye of Allah?

“Chief,” he said finally. “I didn’t slip—nor Wilkins or Smeed.”

“Someone did,” replied the big man, “and it wasn’t

the Eye of Allah, either.”

The manager of the hotel was waiting to take them to the room. He unlocked the door with his pass key.

“Not a thing touched,” he assured the Secret Service men; “there he is, just the way we found him.”

In the doorway between the bedroom and bath a body was huddled. Doctor Brooks knelt quickly beside it. His hands worked swiftly for a moment, then he rose to his feet.

“Dead,” he announced.

“How long?” asked the Chief.

“Some time. Hours I should say—perhaps eight or ten.”

“Cause?” the query was brief.

“It will take an autopsy to determine that. There is no blood or wound to be seen.”

The doctor was again examining the partly rigid body. He opened one hand; it held a cake of soap. There was a grease mark on the hand.

Delamater supplied the explanation. "He touched some grease on the old car I was using," he said. "Must have gone directly to wash it off. See—there is water spilled on the floor."

Water had indeed been splashed on the tile floor of the bath room; a pool of it still remained about the heavy, foreign-looking shoes of the dead man.

Something in it caught Delamater's eye. He leaned down to pick up three pellets of metal, like small shot, round and shining.

"I'll keep these," he said, "though the man was never killed with shot as small as that."

"We shall have to wait for the autopsy report," said the Chief crisply; "that may give the cause of death. Was there anyone in the room—did you enter it with him last night, Del?"

“No,” said the operative; “he was very much agitated when we got here—dismissed me rather curtly at the door. He was quite upset about something—spoke English none too well and said something about a warning and damned our Secret Service as inefficient.”

“A warning!” said the Chief. The dead man’s brief case was on the bed. He crossed to it and undid the straps; the topmost paper told the reason for the man’s disquiet. It showed the familiar, staring eye. And beneath the eye was a warning: this man was to die if he did not leave Washington at once.

The Chief turned to the hotel manager. “Was the door locked?”

“Yes.”

“But it is a spring lock. Someone could have gone out and closed it after him.”

“Not this time. The dead-bolt was thrown. It takes a key to do that from the outside or this thumb-turn on

the inside.” The hotel man demonstrated the action of the heavy bolt.

“Then, with a duplicate key, a man could have left this room and locked the door behind him.”

“Absolutely not. The floor-clerk was on duty all night. I have questioned her: this room was under her eyes all the time. She saw this man return, saw your man, here”—and he pointed to Delamater—“leave him at the door. There was no person left the room after that.”

“See about the autopsy, Doctor,” the Chief ordered.

And to the manager: “Not a thing here must be touched. Admit only Mr. Delamater and no one else unless he vouches for them.

“Del,” he told the operative, “I’m giving you a chance to make up for last night. Go to it.”

And Robert Delamater “went to it” with all the thoroughness at his command, and with a total lack of

result.

The autopsy helped not at all. The man was dead; it was apparently a natural death. “Not a scratch nor a mark on him,” was the report. But: “... next time it will be you,” the note with the staring eye had warned the Secretary of State. The writer of it was taking full credit for the mysterious death.

Robert Delamater had three small bits of metal, like tiny shot, and he racked his brain to connect these with the death. There were fingerprints, too, beautifully developed upon the mysterious missives—prints that tallied with none in the records. There were analyses of the paper—of the ink—and not a clue in any of them.

Just three pellets of metal. Robert Delamater had failed utterly, and he was bitter in the knowledge of his failure.

“He had you spotted, Del,” the Chief insisted. “The writer of these notes may be crazy, but he was clever enough to know that this man *did* see the Secretary.

And he was waiting for him when he came back; then he killed him.”

“Without a mark?”

“He killed him,” the Chief repeated; “then he left—and that’s that.”

“But,” Delamater objected, “the room clerk—”

“—took a nap,” broke in the Chief. But Delamater could not be satisfied with the explanation.

“He got his, all right,” he conceded, “—got it in a locked room nine stories above the street, with no possible means of bringing it upon himself—and no way for the murderer to escape. I tell you there is something more to this: just the letter to the Secretary, as if this Eye of Allah were spying upon him—”

The Chief waved all that aside. “A clever spy,” he insisted. “Too clever for you. And a darn good guesser; he had us all fooled. But we’re dealing with a

madman, not a ghost, and he didn't sail in through a ninth story window nor go out through a locked door; neither did he spy on the Secretary of State in his private office. Don't try to make a supernatural mystery out of a failure, Del."

The big man's words were tempered with a laugh, but there was an edge of sarcasm, ill-concealed.

And then came the next note. And the next. The letters were mailed at various points in and about the city; they came in a flood. And they were addressed to the President of the United States, to the Secretary of War—of the Navy—to all the Cabinet members. And all carried the same threat under the staring eye.

The United States, to this man, represented all that was tyrannical and oppressive to the downtrodden of the earth. He proposed to end it—this government first, then others in their turn. It was the outpouring of a wildly irrational mind that came to the office of the harassed Chief of the United States Secret Service, who had instructions to run this man down—this man who signed himself The Eye of Allah. And do

it quickly for the notes were threatening. Official Washington, it seemed, was getting jumpy and was making caustic inquiries as to why a Secret Service department was maintained.

The Chief, himself, was directing the investigation—and getting nowhere.

“Here is the latest,” he said one morning. “Mailed at New York.” Delamater and a dozen other operatives were in his office: he showed them a letter printed like all the others. There was the eye, and beneath were words that made the readers catch their breath.

“The Eye of Allah sees—it has warned—now it will destroy. The day of judgment is at hand. The battleship *Maryland* is at anchor in the Hudson River at New York. No more shall it be the weapon of a despot government. It will be destroyed at twelve o’clock on September fifth.”

“Wild talk,” said the Chief, “but today is the fourth. The Commander of the *Maryland* has been warned—approach by air or water will be impossible. I want

you men to patrol the shore and nail this man if he shows up. Lord knows what he intends—bluffing probably—but he may try some fool stunt. If he does—get him!”

Eleven-thirty by the watch on Robert Delamater’s wrist found him seated in the bow of a speed-boat the following morning. They patrolled slowly up and down the shore. There were fellow operatives, he knew, scores of them, posted at all points of vantage along the docks.

Eleven forty-five—and the roar of seaplanes came from above where air patrols were-guarding the skies. Small boats drove back and forth on set courses; no curious sight-seeing craft could approach the *Maryland* that day. On board the battleship, too, there was activity apparent. A bugle sounded, and the warning of bellowing Klaxons echoed across the water. Here, in the peace and safety of the big port, the great man-of-war was sounding general quarters, and a scurry of running men showed for an instant on her decks. Anti-aircraft guns swung silently upon imaginary targets—

The watcher smiled at the absurdity of it all—this preparation to repel the attack of a wild-eyed writer of insane threats. And yet—and yet— He knew, too, there was apprehension in his frequent glances at his watch.

One minute to go! Delamater should have watched the shore. And, instead, he could not keep his eyes from the big fighting-ship silhouetted so clearly less than a mile away, motionless and waiting—waiting—for what? He saw the great turreted guns, useless against this puny, invisible opponent. Above them the fighting tops were gleaming. And above them—

Delamater shaded his eyes with a quick, tense hand: the tip of the mast was sparkling. There was a blue flash that glinted along the steel. It was gone to reappear on the fighting top itself—then lower.

What was it? the watching man was asking himself. What did it bring to mind? A street-car? A defective trolley? The zipping flash of a contact made and broken? That last!

Like the touch of a invisible wire, tremendously charged, a wire that touched and retreated, that made and lost its contact, the flashing arc was working toward the deck. It felt its way to the body of the ship; the arc was plain, starting from mid-air to hiss against the armored side; the arc shortened—went to nothing—vanished.... A puff of smoke from an open port proved its presence inside. Delamater had the conviction that a deadly something had gone through the ship's side—was insulated from it—was searching with its blazing, arcing end for the ammunition rooms....

The realization of that creeping menace came to Delamater with a gripping, numbing horror. The seconds were almost endless as he waited. Slowly, before his terrified eyes, the deck of the great ship bulged upward ... slowly it rolled and tore apart ... a mammoth turret with sixteen-inch guns was lifting unhurriedly into the air ... there were bodies of men rocketing skyward....

The mind of the man was racing at lightning speed, and the havoc before him seemed more horrible in its

slow, leisurely progress. If he could only move—do something!

The shock of the blasted air struck him sprawling into the bottom of the boat; the listener was hammered almost to numbness by the deafening thunder that battered and tore through the still air. At top speed the helmsman drove for the shelter of a hidden cove. They made it an instant before the great waves struck high upon the sand spit. Over the bay hung a ballooning cloud of black and gray—lifting for an instant to show in stark ghastliness the wreckage, broken and twisted, that marked where the battleship *Maryland* rested in the mud in the harbor of New York.

The eyes of the Secret-Service men were filled with the indelible impress of what they had seen. Again and again, before him, came the vision of a ship full of men in horrible, slow disintegration; his mind was numbed and his actions and reactions were largely automatic. But somehow he found himself in the roar of the subway, and later he sat in a chair and knew he was in a Pullman of a Washington train.

He rode for hours in preoccupied silence, his gaze fixed unseeingly, striving to reach out and out to some distant, unknown something which he was trying to visualize. But he looked at intervals at his hand that held three metal pellets.

He was groping for the mental sequence which would bring the few known facts together and indicate their cause. A threat—a seeming spying within a closed and secret room—the murder on the ninth floor, a murder without trace of wound or weapon. Weapon! He stared again at the tangible evidence he held; then shook his head in perplexed abstraction. No—the man was killed by unknown means.

And now—the *Maryland*! And a visible finger of death—touching, flashing, feeling its way to the deadly cargo of powder sacks.

Not till he sat alone with his chief did he put into words his thoughts.

“A time bomb did it,” the Chief was saying. “The officials deny it, but what other answer is there? No

one approached that ship—you know that, Del—no torpedo nor aerial bomb! Nothing as fanciful as that!”

Robert Delamater’s lips formed a wry smile. “Nothing at fanciful as that”—and he was thinking, thinking—of what he hardly dared express.

“We will start with the ship’s personnel,” the other continued; “find every man who was not on board when the explosion occurred—”

“No use,” the operative interrupted; “this was no inside job, Chief.” He paused to choose his words while the other watched him curiously.

“Someone *did* reach that ship—reached it from a distance—reached it in the same way they reached that poor devil I left at room nine forty-seven. Listen —”

He told his superior of his vigil on the speed-boat—of the almost invisible flash against the ship’s mast. “He reached it, Chief,” he concluded; “he felt or saw his way down and through the side of that ship. And he

fired their ammunition from God knows where.”

“I wonder,” said the big man slowly; “I wonder if you know just what you are trying to tell me—just how absurd your idea is. Are you seriously hinting at long-distance vision through solid armor-plate—through these walls of stone and steel? And wireless power-transmission through the same wall—!”

“Exactly!” said the operative.

“Why, Del, you must be as crazy as this Eye of Allah individual. It’s impossible.”

“That word,” said Delamater, quietly, “has been crossed out of scientific books in the past few years.”

“What do you mean?”

“You have studied some physical science, of course?” Delamater asked. The Chief nodded.

“Then you know what I mean. I mean that up to recent years science had all the possibilities and

impossibilities neatly divided and catalogued. Ignorance, as always, was the best basis for positive assurance. Then they got inside the atom. And since then your real scientist has been a very humble man. He has seen the impossibility of yesterday become the established fact of to-day."

The Chief of the United States Secret Service was tapping with nervous irritation on the desk before him.

"Yes, yes!" he agreed, and again he looked oddly at his operative. "Perhaps there is something to that; you work along that line, Del: you can have a free hand. Take a few days off, a little vacation if you wish. Yes—and ask Sprague to step in from the other office; he has the personnel list."

Robert Delamater felt the other's eyes follow him as he left the room. "And that about lets me out," he told himself; "he thinks I've gone cuckoo, now."

He stopped in a corridor; his fingers, fumbling in a vest pocket, had touched the little metal spheres.

Again his mind flashed back to the chain of events he had linked together. He turned toward an inner office.

“I would like to see Doctor Brooks,” he said. And when the physician appeared: “About that man who was murdered at the hotel, Doctor—”

“Who died,” the doctor corrected; “we found no evidence of murder.”

“Who was murdered,” the operative insisted. “Have you his clothing where I can examine it?”

“Sure,” agreed the physician. He led Delamater to another room and brought out a box of the dead man’s effects.

“But if it’s murder you expect to prove you’ll find no help in this.”

The Secret Service man nodded. “I’ll look them over, just the same,” he said. “Thanks.”

Alone in the room, he went over the clothing piece by

piece. Again he examined each garment, each pocket, the lining, as he had done before when first he took the case. Metal, he thought, he must find metal.

But only when a heavy shoe was in his hands did the anxious frown relax from about his eyes.

“Of course,” he whispered, half aloud. “What a fool I was! I should have thought of that.”

The soles of the shoes were sewed, but, beside the stitches were metal specks, where cobbler’s nails were driven. And in the sole of one shoe were three tiny holes.

“Melted!” he said exultantly. “Crazy, am I, Chief? This man was standing on a wet floor; he made a perfect ground. And he got a jolt that melted these nails when it flashed out of him.”

He wrapped the clothing carefully and replaced it in the box. And he fingered the metal pellets in his pocket as he slipped quietly from the room.

He did not stop to talk with Doctor Brooks; he wanted to think, to ponder upon the incredible proof of the theory he had hardly dared believe. The Eye of Allah—the maniac—was real; and his power for evil! There was work to be done, and the point of beginning was not plain.

How far did the invisible arm reach? How far could the Eye of Allah see? Where was the generator—the origin of this wireless power; along what channel did it flow? A ray of lightless light—an unseen ethereal vibration.... Delamater could only guess at the answers.

The current to kill a man or to flash a spark into silken powder bags need not be heavy, he knew. Five hundred—a thousand volts—if the mysterious conductor carried it without resistance and without loss. People had been killed by house-lighting currents—a mere 110 volts—when conditions were right. There would be no peculiar or unusual demand upon the power company to point him toward the hidden maniac.

He tossed restlessly throughout the night, and morning brought no answer to his repeated questions. But it brought a hurry call from his Chief.

“Right away,” was the instruction; “don’t lose a minute. Come to the office.”

He found the big man at his desk. He was quiet, unhurried, but the operative knew at a glance the tense repression that was being exercised—the iron control of nerves that demanded action and found incompetence and helplessness instead.

“I don’t believe your fantastic theories,” he told Delamater. “Impractical—impossible! But—” He handed the waiting man a paper. “We must not leave a stone unturned.”

Delamater said nothing; he looked at the paper in his hand. “To the President of the United States,” he read. “Prepare to meet your God. Friday. The eighth. Twelve o’clock.”

The signature he hardly saw; the staring, open eye

was all too familiar.

“That is to-morrow,” said Delamater softly. “The President dies to-morrow.”

“No!” exploded the Chief. “Do you realize what that means? The President murdered—more killings to follow—and the killer unknown! Why the country will be in a panic: the whole structure of the Government is threatened!”

He paused, then added as he struck his open hand upon the desk: “I will have every available man at the White House.”

“For witnesses?” asked Delamater coldly.

The big man stared at his operative; the lines of his face were sagging.

“Do you believe—really—he can strike him down—at his desk—from a distance?”

“I know it.” Delamater’s fingers played for a moment

with three bits of metal in his pocket. Unconsciously he voiced his thoughts: “Does the President have nails in his shoes, I wonder?”

“What—what’s that?” the Chief demanded.

But Delamater made no reply. He was picturing the President. He would be seated at his desk, waiting, waiting ... and the bells would be ringing and whistles blowing from distant shops when the bolt would strike.... It would flash from his feet ... through the thick rug ... through the rug.... It would have to ground.

He paid no heed to his Chief’s repeated question. He was seeing, not the rug in the Presidential office, but below it—underneath it—a heavy pad of rubber.

“If he can be insulated—” he said aloud, and stared unseeingly at his eagerly listening superiors—“even the telephone cut—no possible connection with the ground—”

“For God’s sake, Del, if you’ve got an idea—any hope

at all! I'm—I'm up against it, Del."

The operative brought his distant gaze back to the room and the man across from him. "Yes," he said slowly, thoughtfully, "I've got the beginning of an idea; I don't see the end of it yet."

"We can cut him off from the ground—the President, I mean—make an insulated island where he sits. But this devil will get him the instant he leaves ... unless ... unless...."

"Yes—yes?" The Chief's voice was high-pitched with anxious impatience; for the first time he was admitting to himself his complete helplessness in this emergency.

"Unless," said Delamater, as the idea grew and took shape, "unless that wireless channel works both ways. If it does ... if it does...."

The big man made a gesture of complete incomprehension.

“Wait!” said Robert Delamater, sharply. If ever his sleepy indolence had misled his Chief, there was none to do so now in the voice that rang like cold steel. His eyes were slits under the deep-drawn brows, and his mouth was one straight line.

To the hunter there is no greater game than man. And Robert Delamater, man-hunter, had his treacherous quarry in sight. He fired staccato questions at his Chief.

“Is the President at his desk at twelve?”

“Yes.”

“Does he know—about this?”

“Yes.”

“Does he know it means death?”

The Chief nodded.

“I see a way—a chance,” said the operative. “Do I get

a free hand?”

“Yes—Good Lord, yes! If there’s any chance of—”

Delamater silenced him. “I’ll be the one to take the chance,” he said grimly. “Chief, I intend to impersonate the President.”

“Now listen— The President and I are about the same build. I know a man who can take care of the make-up; he will get me by anything but a close inspection. This Eye of Allah, up to now, has worked only in the light. We’ll have to gamble on that and work our change in the dark.

“The President must go to bed as usual—impress upon him that he may be under constant surveillance. Then, in the night, he leaves—

“Oh, I know he won’t want to hide himself, but he must. That’s up to you.

“Arrange for me to go to his room before daylight. From that minute on I am the President. Get me his

routine for that morning; I must follow it so as to arouse no least suspicion.”

“But I don’t see—” began the Chief. “You will impersonate him—yes—but what then? You will be killed if this maniac makes good. Is the President of the United States to be a fugitive? Is—”

“Hold on, hold on!” said Delamater. He leaned back in his chair; his face relaxed to a smile, then a laugh.

“I’ve got it all now. Perhaps it will work. If not—” A shrug of the shoulders completed the thought. “And I have been shooting it to you pretty fast haven’t I! Now here is the idea—

“I must be in the President’s chair at noon. This Allah person will be watching in, so I must be acting the part all morning. I will have the heaviest insulation I can get under the rug, and I’ll have something to take the shot instead of myself. And perhaps, perhaps I will send a message back to the Eye of Allah that will be a surprise.

“Is it a bet?” he asked. “Remember, I’m taking the chance—unless you know some better way—”

The Chief’s chair came down with a bang. “We’ll gamble on it, Del,” he said; “we’ve got to—there is no other way.... And now what do you want?”

“A note to the White House electrician,” said Robert Delamater, “and full authority to ask for anything I may need, from the U. S. Treasury down to a pair of wire-cutters.”

His smile had become contagious; the Chief’s anxious look relaxed. “If you pull this off, Del, they may give you the Treasury or the Mint at that. But remember, republics are notoriously ungenerous.”

“We’ll have to gamble on that, too,” said Robert Delamater.

The heart of the Nation is Washington. Some, there are, who would have us feel that New York rules our lives. Chicago—San Francisco—these and other great cities sometimes forget that they are mere ganglia on

the financial and commercial nervous system. The heart is Washington, and, Congress to the contrary notwithstanding, the heart of that heart is not the domed building at the head of Pennsylvania Avenue, but an American home. A simple, gracious mansion, standing in quiet dignity and whiteness above its velvet lawns.

It is the White House that draws most strongly at the interest and curiosity of the homely, common throng that visits the capital.

But there were no casual visitors at the White House on the seventh of September. Certain Senators, even, were denied admittance. The President was seeing only the members of the Cabinet and some few others.

It is given to a Secret Service operative, in his time, to play many parts. But even a versatile actor might pause at impersonating a President. Robert Delamater was acting the role with never a fumble. He sat, this new Robert Delamater, so startlingly like the Chief Executive, in the chair by a flat top desk.

And he worked diligently at a mass of correspondence.

Secretaries came and went; files were brought. Occasionally he replied to a telephone call—or perhaps called someone. It would be hard to say which happened, for no telephone bells rang.

On the desk was a schedule that Delamater consulted. So much time for correspondence—so many minutes for a conference with this or that official, men who were warned to play up to this new Chief Executive as if the life of their real President were at stake.

To any observer the busy routine of the morning must have passed with never a break. And there was an observer, as Delamater knew. He had wondered if the mystic ray might carry electrons that would prove its presence. And now he knew.

The Chief of the U. S. Secret Service had come for a consultation with the President. And whatever lingering doubts may have stifled his reluctant imagination were dispelled when the figure at the

desk opened a drawer.

“Notice this,” he told the Chief as he appeared to search for a paper in the desk. “An electroscope; I put it in here last night. It is discharging. The ray has been on since nine-thirty. No current to electrocute me—just a penetrating ray.”

He returned the paper to the drawer and closed it.

“So that is that,” he said, and picked up a document to which he called the visitor’s attention.

“Just acting,” he explained. “The audience may be critical; we must try to give them a good show! And now give me a report. What are you doing? Has anything else turned up? I am counting on you to stand by and see that that electrician is on his toes at twelve o’clock.”

“Stand by is right,” the Chief agreed; “that’s about all we can do. I have twenty men in and about the grounds—there will be as many more later on. And I know now just how little use we are to you, Del.”

“Your expression!” warned Delamater. “Remember you are talking to the President. Very official and all that.”

“Right! But now tell me what is the game, Del. If that devil fails to knock you out here where you are safe, he will get you when you leave the room.”

“Perhaps,” agreed the pseudo-executive, “and again, perhaps not. He won’t get me here; I am sure of that. They have this part of the room insulated. The phone wire is cut—my conversations there are all faked.

“There is only one spot in this room where that current can pass. A heavy cable is grounded outside in wet earth. It comes to a copper plate on this desk; you can’t see it—it is under those papers.”

“And if the current comes—” began the visitor.

“When it comes,” the other corrected, “it will jump to that plate and go off harmlessly—I hope.”

“And then what? How does that let you out?”

“Then we will see,” said the presidential figure. “And you’ve been here long enough, Chief. Send in the President’s secretary as you go out.”

“He arose to place a friendly, patronizing hand on the other’s shoulder.

“Good-by,” he said, “and watch that electrician at twelve. He is to throw the big switch when I call.”

“Good luck,” said the big man huskily. “We’ve got to hand it to you, Del; you’re—”

“Good-by!” The figure of the Chief Executive turned abruptly to his desk.

There was more careful acting—another conference—some dictating. The clock on the desk gave the time as eleven fifty-five. The man before the flat topped desk verified it by a surreptitious glance at his watch. He dismissed the secretary and busied himself with some personal writing.

Eleven fifty-nine—and he pushed paper and pen aside.

The movement disturbed some other papers, neatly stacked. They were dislodged, and where they had lain was a disk of dull copper.

“Ready,” the man called softly. “Don’t stand too near that line.” The first boom of noonday bells came faintly to the room.

The President—to all but the other actors in the morning’s drama—leaned far back in his chair. The room was suddenly deathly still. The faint ticking of the desk clock was loud and rasping. There was heavy breathing audible in the room beyond. The last noonday chime had died away....

The man at the desk was waiting—waiting. And he thought he was prepared, nerves steeled, for the expected. But he jerked back, to fall with the overturned chair upon the soft, thick-padded rug, at the ripping, crackling hiss that tore through the silent room.

From a point above the desk a blue arc flamed and wavered. Its unseen terminal moved erratically in the

air, but the other end of the deadly flame held steady upon a glowing, copper disc.

Delamater, prone on the floor, saw the wavering point that marked the end of the invisible carrier of the current—saw it drift aside till the blue arc was broken. It returned, and the arc crashed again into blinding flame. Then, as abruptly, the blue menace vanished.

The man on the floor waited, waited, and tried to hold fast to some sense of time.

Then: “Contact!” he shouted. “The switch! Close the switch!”

“Closed!” came the answer from a distant room. There was a shouted warning to unseen men: “Stand back there—back—there’s twenty thousand volts on that line—”

Again the silence....

“Would it work? Would it?” Delamater’s mind was full

of delirious, half-thought hopes. That fiend in some far-off room had cut the current meant as a death-bolt to the Nation's' head. He would leave the ray on—look along it to gloat over his easy victory. His generator must be insulated: would he touch it with his hand, now that his own current was off?—make of himself a conductor?

In the air overhead formed a terrible arc.

From the floor, Delamater saw it rip crashingly into life as twenty thousand volts bridged the gap of a foot or less to the invisible ray. It hissed tremendously in the stillness....

And Delamater suddenly buried his face in his hands. For in his mind he was seeing a rigid, searing body, and in his nostrils, acrid, distinct, was the smell of burning flesh.

“Don't be a fool,” he told himself fiercely. “Don't be a fool! Imagination!”

The light was out.

“Switch off!” a voice was calling. There was a rush of swift feet from the distant doors; friendly hands were under him—lifting him—as the room, for Robert Delamater, President-in-name of the United States, turned whirlingly, dizzily black....

Robert Delamater, U. S. Secret Service operative, entered the office of his Chief. Two days of enforced idleness and quiet had been all he could stand. He laid a folded newspaper before the smiling, welcoming man.

“That’s it, I suppose,” he said, and pointed to a short notice.

“X-ray Operator Killed,” was the caption. “Found Dead in Office in Watts Building.” He had read the brief item many times.

“That’s what we let the reporters have,” said the Chief.

“Was he”—the operative hesitated for a moment —“pretty well fried?”

“Quite!”

“And the machine?”

“Broken glass and melted metal. He smashed it as he fell.”

“The Eye of Allah,” mused Delamater. “Poor devil—poor, crazy devil. Well, we gambled—and we won. How about the rest of the bet? Do I get the Mint?”

“Hell, no!” said the Chief. “Do you expect to win all the time? They want to know why it took us so long to get him.

“Now, there’s a little matter out in Ohio, Del, that we’ll have to get after—”

#68 The Fifth-dimension Catapult, By Murray Leinster:

The story of Tommy Reames' extraordinary rescue of Professor Denham and his daughter—marooned in the fifth dimension.

Aproximate word count:

Bigotry:

Warnings:

which whirled madly

- - -

FOREWORD

This story has no normal starting-place, because there are too many places where it might be said to begin. One might commence when Professor Denham, Ph.D., M.A., etc., isolated a metal that scientists have been talking about for many years without ever being able to smelt. Or it might start with his first experimental use of that metal with entirely impossible results. Or it might very plausibly begin with an interview between a celebrated leader of gangsters in the city of Chicago and a spectacled

young laboratory assistant, who had turned over to him a peculiar heavy object of solid gold and very nervously explained, and finally managed to prove, where it came from. With also impossible results, because it turned “King” Jacaro, lord of vice-resorts and rum-runners, into a passionate enthusiast in non-Euclidean geometry. The whole story might be said to begin with the moment of that interview.

But that leaves out Smithers, and especially it leaves out Tommy Reames. So, on the whole, it is best to take up the narrative at the moment of Tommy’s first entrance into the course of events.

Chapter 1

He came to a stop in a cloud of dust that swirled up to and all about the big roadster, and surveyed the gate of the private road. The gate was rather impressive. At its top was a sign. "Keep Out!" Halfway down was another sign. "Private Property. Trespassers Will Be Prosecuted." On one gate-post was another notice, "Live Wires Within." and on the other a defiant placard. "Savage Dogs At Large Within This Fence."

The fence itself was all of seven feet high and made of the heaviest of woven-wire construction. It was topped with barbed wire, and went all the way down both sides of a narrow right of way until it vanished in the distance.

Tommy got out of the car and opened the gate. This fitted the description of his destination, as given him by a brawny, red-headed filling-station attendant in the village some two miles back. He drove the roadster through the gate, got out and closed it piously, got back in the car and shot it ahead.

He went humming down the narrow private road at forty-five miles an hour. That was Tommy Reames' way. He looked totally unlike the conventional description of a scientist of any sort—as much unlike a scientist as his sport roadster looked unlike a scientist's customary means of transit—and ordinarily he acted quite unlike one. As a matter of fact, most of the people Tommy associated with had no faintest inkling of his taste for science as an avocation. There was Peter Dalzell, for instance, who would have held up his hands in holy horror at the idea of Tommy Reames being the author of that article. “On the Mass and Inertia of the Tesseract,” which in the *Philosophical Journal* had caused a controversy.

And there was one Mildred Holmes—of no importance in the matter of the Fifth-Dimension Catapult—who would have lifted beautifully arched eyebrows in bored unbelief if anybody had suggested that Tommy Reames was that Thomas Reames whose “Additions to Herglotz's Mechanics of Continua” produced such diversities of opinion in scientific circles. She intended to make Tommy propose to her some day,

and thought she knew all about him. And everybody, everywhere, would have been incredulous of his present errand.

Gliding down the narrow, fenced-in road. Tommy was a trifle dubious about this errand himself. A yellow telegraph-form in his pocket read rather like a hoax, but was just plausible enough to have brought him away from a rather important tennis match. The telegram read:

PROFESSOR DENHAM IN EXTREME DANGER
THROUGH EXPERIMENT BASED ON YOUR ARTICLE
ON DOMINANT COORDINATES YOU ALONE CAN
HELP HIM IN THE NAME OF HUMANITY COME AT
ONCE.

A. VON HOLTZ.

The fence went on past the car. A mile, a mile and a half of narrow lane, fenced in and made as nearly intruder-proof as possible.

“Wonder what I’d do,” said Tommy Reames, “if

another car came along from the other end?”

He deliberately tried not to think about the telegram any more. He didn't believe it. He couldn't believe it. But he couldn't ignore it, either. Nobody could: few scientists, and no human being with a normal amount of curiosity. Because the article on dominant coordinates had appeared in the *Journal of Physics* and had dealt with a state of things in which the normal coordinates of everyday existence were assumed to have changed their functions: when the coordinates of time, the vertical, the horizontal and the lateral changed places and a man went east to go up and west to go “down” and ran his street-numbers in a fourth dimension. It was mathematical foolery, from one standpoint, but it led to some fascinating if abstruse conclusions.

But his brain would not remain away from the subject of the telegram, even though a chicken appeared in the fenced-in lane ahead of him and went flapping wildly on before the car. It rose in mid-air, the car overtook it as it rose above the level of the hood, and there was a rolling, squawking bundle of shedding

feathers tumbling over and over along the hood until it reached the slanting windshield. There it spun wildly upward, left a cloud of feather's fluttering about Tommy's head, and fell still squawking into the road behind. By the back-view mirror, Tommy could see it picking itself up and staggering dizzily back to the side of the road.

"My point was," said Tommy vexedly to himself, speaking of the article the telegram referred to, "that a man can only recognize three dimensions of space and one of time. So that if he got shot out of this cosmos altogether he wouldn't know the difference. He'd still seem to be in a three-dimensioned universe. And what is there in that stuff to get Denham in trouble?"

A house appeared ahead. A low, rambling sort of bungalow with a huge brick barn behind it. The house of Professor Denham, very certainly, and that barn was the laboratory in which he made his experiments.

Instinctively, Tommy stepped on the gas. The car leaped ahead. And then he was braking frantically. A

pipe-framed gate with thinner, unpainted wire mesh filling its surface loomed before him, much too late for him to stop. There was a minor shock, a crashing and squeaking, and then a crash and shattering of glass. Tommy bent low as the top bar of the gate hit his windshield. The double glass cracked and crumpled and bent, but did not fly to bits. And the car came to a halt with its wheels intricately entangled in torn-away fence wire. The gate had been torn from its hinges and was draped rakishly over the roadster. A tire went flat with a loud hissing noise, and Tommy Reames swore softly under his breath and got out to inspect the damage.

He was deciding that nothing irreparable was wrong when a man came bursting out of the brick building behind the house. A tall, lean, youngish man who waved his arms emphatically and approached shouting:

“You had no right to come in here! You must go away at once! You have damaged property! I will tell the Professor! You must pay for the damage! You must—”

“Damn!” said Tommy Reames. He had just seen that his radiator was punctured. A spout of ruddy, rusty water was pouring out on the grass.

The youngish man came up furiously. A pale young man, Tommy noticed. A young man with bristling, close-cropped hair and horn-rimmed spectacles before weak-looking eyes. His mouth was very full and very red, in marked contrast to the pallor of his cheeks.

“Did you not see the sign upon the gate?” he demanded angrily, in curiously stilted English. “Did you not see that trespassers are forbidden? You must go away at once! You will be prosecuted! You will be imprisoned! You—”

Tommy said irritably:

“Are you Von Holtz? My name is Reames. You telegraphed me.”

The waving, lanky arms stopped in the middle of an excited gesture. The weak-looking eyes behind the

lenses widened. A pink tongue licked the too-full, too-red lips.

“Reames? The Herr Reames?” Von Holtz stammered. Then he said suspiciously, “But you are not—you cannot be the Herr Reames of the article on dominant coordinates!”

“I don’t know why,” said Tommy annoyedly. “I’m also the Herr Reames of several other articles, such as on the mechanics of continua and the mass and inertia of the tesseract. And I believe the current *Philosophical Journal*—”

He surveyed the spouting red stream from the radiator and shrugged ruefully.

“I wish you’d telephone the village to have somebody come out and fix my car,” he said shortly, “and then tell me if this telegram is a joke or not.”

He pulled out a yellow form and offered it. He had taken an instinctive dislike to the lean figure before him, but suppressed the feeling.

Von Holtz took the telegram and read it, and smoothed it out, and said agitatedly:

“But I thought the Herr Reames would be—would be a venerable gentleman! I thought—”

“You sent that wire,” said Tommy. “It puzzled me just enough to make me rush out here. And I feel like a fool for having done it. What’s the matter? Is it a joke?”

Von Holtz shook his head violently, even as he bit his lips.

“No! No!” he protested. “The Herr Professor Denham is in the most terrible, most deadly danger! I—I have been very nearly mad, Herr Reames. The Ragged Men may seize him!... I telegraphed to you. I have not slept for four nights. I have worked! I have racked my brains! I have gone nearly insane, trying to rescue the Herr Professor! And I—”

Tommy stared.

“Four days?” he said. “The thing, whatever it is, has been going on for four days?”

“Five,” said Von Holtz nervously. “It was only to-day that I thought of you, Herr Reames. The Herr Professor Denham had praised your articles highly. He said that you were the only man who would be able to understand his work. Five days ago—”

Tommy grunted.

“If he’s been in danger for five days,” he said skeptically, “he’s not in such a bad fix or it’d have been over. Will you phone for a repairman? Then we’ll see what it’s all about.”

The lean arms began to wave again as Von Holtz said desperately:

“But Herr Reames, it is urgent! The Herr Professor is in deadly danger!”

“What’s the matter with him?”

“He is marooned,” said Von Holtz. Again he licked his lips. “He is marooned, Herr Reames, and you alone—”

“Marooned?” said Tommy more skeptically still. “In the middle of New York State? And I alone can help him? You sound more and more as if you were playing a rather elaborate and not very funny practical joke. I’ve driven sixty miles to get here. What is the joke, anyhow?”

Von Holtz said despairingly:

“But it is true, Herr Reames! He is marooned. He has changed his coordinates. It was an experiment. He is marooned in the fifth dimension!”

There was dead silence. Tommy Reames stared blankly. Then his gorge rose. He had taken an instinctive dislike to this lean young man, anyhow. So he stared at him, and grew very angry, and would undoubtedly have gotten into his car and turned it about and driven it away again if it had been in any shape to run. But it wasn’t. One tire was flat, and the last ruddy drops from the radiator were dripping

slowly on the grass. So he pulled out a cigarette case and lighted a cigarette and said sardonically:

“The fifth dimension? That seems rather extreme. Most of us get along very well with three dimensions. Four seems luxurious. Why pick on the fifth?”

Von Holtz grew pale with anger in his turn. He waved his arms, stopped, and said with stiff formality:

“If the Herr Reames will follow me into the laboratory I will show him Professor Denham and convince him of the Herr Professor’s extreme danger.”

Tommy had a sudden startling conviction that Von Holtz was in earnest. He might be mad, but he was in earnest. And there was undoubtedly a Professor Denham, and this was undoubtedly his home and laboratory.

“I’ll look, anyway,” said Tommy less skeptically. “But it is rather incredible, you know!”

“It is impossible,” said Von Holtz stiffly. “You are

right, Herr Reames. It is quite impossible. But it is a fact.”

He turned and stalked toward the big brick barn behind the house. Tommy went with him, wholly unbelieving and yet beginning to wonder if, just possibly, there was actually an emergency of a more normal and ghastly nature in being. Von Holtz might be a madman. He might....

Gruesome, grisly thoughts ran through Tommy's head. A madman dabbling in science might do incredible things, horrible things, and then demand assistance to undo an unimaginable murder....

Tommy was tense and alert as Von Holtz opened the door of the barnlike laboratory. He waved the lean young man on ahead.

“After you,” he said curtly.

He felt almost a shiver as he entered. But the interior of the laboratory displayed no gruesome scene. It was a huge, high-ceilinged room with a concrete floor. A

monster dynamo was over in one corner, coupled to a matter-of-fact four-cylinder crude-oil engine, to which was also coupled by a clutch an inexplicable windlass-drum with several hundred feet of chain wrapped around it. There were ammeters and voltmeters on a control panel, and one of the most delicate of dynamometers on its own stand, and there were work benches and a motor-driven lathe and a very complete equipment for the working of metals. And there was an electric furnace, with splashes of solidified metal on the floor beside it, and there was a miniature casting-floor, and at the farther end of the monster room there was a gigantic solenoid which evidently had once swung upon gymbals and as evidently now was broken, because it lay toppled askew upon its supports.

The only totally unidentifiable piece of apparatus in the place was one queer contrivance at one side. It looked partly like a machine-gun, because of a long brass barrel projecting from it. But the brass tube came out of a bulging casing of cast aluminum and there was no opening through which shells could be

fed.

Von Holz moved to that contrivance, removed a cap from the end of the brass tube, looked carefully into the opening, and waved stiffly for Tommy to look in.

Again Tommy was suspicious; watched until Von Holtz was some distance away. But the instant he put his eye to the end of the brass tube he forgot all caution, all suspicion, all his doubts. He forgot everything in his amazement.

There was a lens in the end of the brass tube. It was, in fact, nothing more or less than a telescope, apparently looking at something in a closed box. But Tommy was not able to believe that he looked at an illuminated miniature for even the fraction of a second. He looked into the telescope, and he was seeing out-of-doors. Through the aluminum casting that enclosed the end of the tube. Through the thick brick walls of the laboratory. He was gazing upon a landscape such as should not—such as could not—exist upon the earth.

There were monstrous, feathery tree-ferns waving languid fronds in a breeze that came from beyond them. The telescope seemed to be pointing at a gentle slope, and those tree-ferns cut off a farther view, but there was an impenetrable tangle of breast-high foliage between the instrument and that slope, and halfway up the incline there rested a huge steel globe.

Tommy's eyes fixed themselves upon the globe. It was man-made, of course. He could see where it had been bolted together. There were glassed-in windows in its sides, and there was a door.

As Tommy looked, that door opened partway, stopped as if someone within had hesitated, and then opened fully. A man came out. And Tommy said dazedly:

“My God!”

Because the man was a perfectly commonplace sort of individual, dressed in a perfectly commonplace fashion, and he carried a perfectly commonplace briar pipe in his hand. Moreover, Tommy recognized him.

He had seen pictures of him often enough, and he was Professor Edward Denham, entitled to put practically all the letters of the alphabet after his name, the author of "Polymerization of the Pseudo-Metallic Nitrides" and the proper owner of this building and its contents. But Tommy saw him against a background of tree-ferns such as should have been extinct upon this earth since the Carboniferous Period, some millions of years ago.

He was looking hungrily at his briar pipe. Presently he began to hunt carefully about on the ground. He picked together half a handful of brownish things which had to be dried leaves. He stuffed them into the pipe, struck a match, and lighted it. He puffed away gloomily, surrounded by wholly monstrous vegetation. A butterfly fluttered over the top of the steel globe. Its wings were fully a yard across. It flittered lightly to a plant and seemed to wait, and abruptly a vivid carmine blossom opened wide; wide enough to admit it.

Denham watched curiously enough, smoking the rank and plainly unsatisfying dried leaves. He turned his

head and spoke over his shoulder. The door opened again. Again Tommy Reames was dazed. Because a girl came out of the huge steel sphere—and she was a girl of the most modern and most normal sort. A trim sport frock, slim silken legs, bobbed hair....

Tommy did not see her face until she turned, smiling, to make some comment to Denham. Then he saw that she was breath-takingly pretty. He swore softly under his breath.

The butterfly backed clumsily out of the gigantic flower. It flew lightly away, its many-colored wings brilliant in the sunshine. And the huge crimson blossom closed slowly.

Denham watched the butterfly go away. His eyes returned to the girl who was smiling at the flying thing, now out of the field of vision of the telescope. And there was utter discouragement visible in every line of Denham's figure. Tommy saw the girl suddenly reach out her hand and put it on Denham's shoulder. She patted it, speaking in an evident attempt to encourage him. She smiled, and talked coaxingly, and

presently Denham made a queer, arrested gesture and went heavily back into the steel globe. She followed him, though she looked wearily all about before the door closed behind her, and when Denham could not see her face, her expression was tired and anxious indeed.

Tommy had forgotten Von Holtz, had forgotten the laboratory, had forgotten absolutely everything. If his original suspicions of Von Holtz had been justified, he could have been killed half a dozen times over. He was oblivious to everything but the sight before his eyes.

Now he felt a touch on his shoulder and drew his head away with a jerk. Von Holtz was looking down at him, very pale, with his weak-looking eyes anxious.

“They are still all right?” he demanded.

“Yes,” said Tommy dazedly. “Surely. Who is that girl?”

“That is the Herr Professor’s daughter Evelyn,” said Von Holtz uneasily. “I suggest, Herr Reames, that you

swing the dimensoscope about.”

“The—what?” asked Tommy, still dazed by what he had seen.

“The dimensoscope. This.” Von Holtz shifted the brass tube. The whole thing was mounted so that it could be swung in any direction. The mounting was exactly like that of a normal telescope. Tommy instantly put his eye to the eyepiece again.

He saw more tree-ferns, practically the duplicates of the background beyond the globe. Nothing moved save small, fugitive creatures among their fronds. He swung the telescope still farther. The landscape swept by before his eyes. The tree-fern forest drew back. He saw the beginning of a vast and noisome morass, over which lay a thick haze as of a stream raised by the sun. He saw something move in that morass; something huge and horrible with a long and snake-like neck and the tiniest of heads at the end of it. But he could not see the thing clearly.

He swung the telescope yet again. And he looked over

miles and miles of level, haze-blanketed marsh. Here and there were clumps of taller vegetation. Here and there were steaming, desolate pools. And three or four times he saw monstrous objects moving about clumsily in the marsh-land.

But then a glitter at the skyline caught his eye. He tilted the telescope to see more clearly, and suddenly he caught his breath. There, far away at the very horizon, was a city. It was tall and gleaming and very strange. No earthly city ever flung its towers so splendidly high and soaring. No city ever built by man gave off the fiery gleam of gold from all its walls and pinnacles. It looked like an artist's dream, hammered out in precious metal, with its outlines softened by the haze of distance.

And something was moving in the air near the city. Staring, tense, again incredulous, Tommy Reames strained his eyes and saw that it was a machine. An air-craft; a flying-machine of a type wholly unlike anything ever built upon the planet Earth. It swept steadily and swiftly toward the city, dwindling as it went. It swooped downward toward one of the mighty

spires of the city of golden gleams, and vanished.

It was with a sense of shock, of almost physical shock, that Tommy came back to realization of his surroundings to feel Von Holtz's hand upon his shoulder and to hear the lean young man saying harshly:

"Well, Herr Reames? Are you convinced that I did not lie to you? Are you convinced that the Herr Professor Denham is in need of help?"

Tommy blinked dazedly as he looked around the laboratory again. Brick walls, an oil-spattered crude-oil engine in one corner, a concrete floor and an electric furnace and a casting-box....

"Why—yes...." said Tommy dazedly. "Yes. Of course!" Clarity came to his brain with a jerk. He did not understand at all, but he believed what he had seen. Denham and his daughter were somewhere in some other dimension, yet within range of the extraordinary device he had looked through. And they were in trouble. So much was evident from their

poses and their manner. "Of course," he repeated. "They're—there, wherever it is, and they can't get back. They don't seem to be in any imminent danger...."

Von Holtz licked his lips.

"The Ragged Men have not found them yet," he said in a hushed, harsh voice. "Before they went in the globe we saw the Ragged Men. We watched them. If they do find the Herr Professor and his daughter, they will kill them very slowly, so that they will take days of screaming agony to die. It is that that I am afraid of, Herr Reames. The Ragged Men roam the tree-fern forests. If they find the Herr Professor they will trace each nerve to its root of agony until he dies. And we will be able only to watch...."

Chapter 2

“The thing is,” said Tommy feverishly, “that we’ve got to find a way to get them back. Whether it duplicates Denham’s results or not. How far away are they?”

“A few hundred yards, perhaps,” said Von Holtz wearily, “or ten million miles. It is the same thing. They are in a place where the fifth dimension is the dominant coordinate.”

Tommy was pacing up and down the laboratory. He stopped and looked through the eyepiece of the extraordinary vision apparatus. He tore himself away from it again.

“How does this thing work?” he demanded.

Von Holtz began to unscrew two wing-nuts which kept the top of the aluminum casting in place.

“It is the first piece of apparatus which Professor Denham made,” he said precisely. “I know the theory, but I cannot duplicate it. Every dimension is at right

angles to all other dimensions, of course. The Herr Professor has a note, here—”

He stopped his unscrewing to run over a heap of papers on the work-bench—papers over which he seemed to have been poring desperately at the time of Tommy’s arrival. He handed a sheet to Tommy, who read:

“If a creature who was aware of only two dimensions made two right-angled objects and so placed them that all the angles formed by the combination were right angles, he would contrive a figure represented by the corner of a box; he would discover a third dimension. Similarly, if a three-dimensioned man took three right angles and placed them so that all the angles formed were right angles, he would discover a fourth dimension. This, however, would probably be the time dimension, and to travel in time would instantly be fatal. But with four right angles he could discover a fifth dimension, and with five right angles he could discover a sixth....”

Tommy Reames put down the paper impatiently.

“Of course” he said brusquely. “I know all that stuff. But up to the present time nobody has been able to put together even three right angles, in practise.”

Von Holtz had returned to the unscrewing of the wing-nuts. He lifted off the cover of the dimensoscope.

“It is the thing the Herr Professor did not confide to me,” he said bitterly. “The secret. The one secret! Look in here.”

Tommy looked. The objective-glass at the end of the telescope faced a mirror, which was inclined to its face at an angle of forty-five degrees. A beam of light from the objective would be reflected to a second mirror, twisted in a fashion curiously askew. Then the light would go to a third mirror....

Tommy looked at that third mirror, and instantly his eyes ached. He closed them and opened them again. Again they stung horribly. It was exactly the sort of eye-strain which comes of looking through a lens which does not focus exactly, or through a strange

pair of eyeglasses. He could see the third mirror, but his eyes hurt the instant they looked upon it, as if that third mirror were distorted in an impossible fashion. He was forced to draw them away. He could see, though, that somehow that third mirror would reflect his imaginary beam of light into a fourth mirror of which he could see only the edge. He moved his head—and still saw only the edge of a mirror. He was sure of what he saw, because he could look into the wavy, bluish translucency all glass shows upon its edge. He could even see the thin layer of silver backing. But he could not put himself into a position in which more than the edge of that mirror was visible.

“Good Lord!” said Tommy Reames feverishly. “That mirror—”

“A mirror at forty-five degrees,” said Von Holtz precisely, “reflects light at a right angle. There are four mirrors, and each bends a ray of light through a right angle which is also a right angle to all the others. The result is that the dimensoscope looks into what is a fifth dimension, into which no man ever looked before. But I cannot move other mirrors into

the positions they have in this instrument. I do not know how.”

Tommy shook his head impatiently, staring at the so-simple, yet incredible device whose theory had been mathematically proven numberless times, but never put into practice before.

“Having made this device,” said Von Holtz, “the Herr Professor constructed what he termed a catapult. It was a coil of wire, like the large machine there. It jerked a steel ball first vertically, then horizontally, then laterally, then in a fourth-dimensional direction, and finally projected it violently off in a fifth-dimensional path. He made small hollow steel balls and sent a butterfly, a small sparrow, and finally a cat into that other world. The steel balls opened of themselves and freed those creatures. They seemed to suffer no distress. Therefore he concluded that it would be safe for him to go, himself. His daughter refused to permit him to go alone, and he was so sure of his safety that he allowed her to enter the globe with him. She did. I worked the catapult which flung the globe in the fifth dimension, and his device for

returning failed to operate. Hence he is marooned.”

“But the big catapult—”

“Can you not see that the big catapult is broken?” demanded Von Holtz bitterly. “A special metal is required for the missing parts. That, I know how to make. Yes. I can supply that. But I cannot shape it! I cannot design the gears which will move it as it should be moved! I cannot make another dimensoscope. I cannot, Herr Reames, calculate any method of causing four right angles to be all at right angles to each other. It is my impossibility! It is for that that I have appealed to you. You see it has been done. I see that it is done. I can make the metal which alone can be moved in the necessary direction. But I cannot calculate any method of moving it in that direction! If you can do so, Herr Reames, we can perhaps save the Herr Professor Denham. If you cannot—Gott! The death he will die is horrible to think of!”

“And his daughter,” said Tommy grimly. “His daughter, also.”

He paced up and down the laboratory again. Von Holtz moved to the work-bench from which he had taken Denham's note. There was a pile of such memoranda, thumbed over and over. And there were papers in the angular, precise handwriting which was Von Holtz's own, and calculations and speculations and the remains of frantic efforts to work out, somehow, the secret which as one manifestation had placed one mirror so that it hurt the eyes to look at it, and one other mirror so that from every angle of a normal existence, one could see only the edge.

"I have worked, Herr Reames," said Von Holtz drearily. "Gott! How I have worked! But the Herr Professor kept some things secret, and that so-essential thing is one of them."

Presently he said tiredly:

"The dimension-traveling globe was built in this laboratory. It rested here." He pointed. "The Herr Professor was laughing and excited at the moment of departure. His daughter smiled at me through the window of the globe. There was an under-carriage

with wheels upon it. You cannot see those wheels through the dimensoscope. They got into the globe and closed the door. The Herr Professor nodded to me through the glass window. The dynamo was running at its fullest speed. The laboratory smelled of hot oil, and of ozone from the sparks. I lifted my hand, and the Herr Professor nodded again, and I threw the switch. This switch, Herr Reames! It sparked as I closed it, and the flash partly blinded me. But I saw the globe rush toward the giant catapult yonder. It leaped upward into the huge coil, which whirled madly. Dazed, I saw the globe hanging suspended in mid-air, two feet from the floor. It shook! Once! Twice! With violence! Suddenly its outline became hazy and distorted. My eyes ached with looking at it. And then it was gone!”

Von Holtz’s arms waved melodramatically.

“I rushed to the dimensoscope and gazed through it into the fifth dimension. I saw the globe floating onward through the air, toward that bank of glossy ferns. I saw it settle and turn over, and then slowly right itself as it came to rest. The Herr Professor got

out of it. I saw him through the instrument which could look into the dimension into which he had gone. He waved his hand to me. His daughter joined him, surveying the strange cosmos in which they were. The Herr Professor plucked some of the glossy ferns, took photographs, then got back into the globe.

“I awaited its return to our own world. I saw it rock slightly as he worked upon the apparatus within. I knew that when it vanished from the dimensoscope it would have returned to our own universe. But it remained as before. It did not move. After three hours of anguished waiting, the Herr Professor came out and made signals to me of despair. By gestures, because no sound could come through the dimensoscope itself, he begged me to assist him. And I was helpless! Made helpless by the Herr Professor’s own secrecy! For four days and nights I have toiled, hoping desperately to discover what the Herr Professor had hidden from me. At last I thought of you. I telegraphed to you. If you can assist me....”

“I’m going to try it, of course,” said Tommy shortly.

He paced back and forth. He stopped and looked through the brass-tubed telescope. Giant tree-ferns, unbelievable but real. The steel globe resting partly overturned upon a bank of glossy ferns. Breast-high, incredible foliage between the point of vision and that extraordinary vehicle.

While Tommy had been talking and listening, while he had been away from the eyepiece, one or other of the occupants of the globe had emerged from it. The door was open. But now the girl came bounding suddenly through the ferns. She called, though it seemed to Tommy that there was a curious air of caution even in her calling. She was excited, hopefully excited.

Denham came out of the globe with a clumsy club in his hand. But Evelyn caught his arm and pointed up into the sky. Denham stared, and then began to make wild and desperate gestures as if trying to attract attention to himself.

Tommy watched for minutes, and then swung the dimensoscope around. It was extraordinary, to be sitting in the perfectly normal brick-walled laboratory,

looking into a slender brass tube, and seeing another universe entirely, another wild and unbelievable landscape.

The tree-fern forest drew back and the vast and steaming morass was again in view. There were distant bright golden gleams from the city. But Tommy was searching the sky, looking in the sky of a world in the fifth dimension for a thing which would make a man gesticulate hopefully.

He found it. It was an aircraft, startlingly close through the telescope. A single figure was seated at its controls, motionless as if bored, with exactly the air of a weary truck driver piloting a vehicle along a roadway he does not really see. And Tommy, being near enough to see the pilot's pose, could see the aircraft clearly. It was totally unlike a terrestrial airplane. A single huge and thick wing supported it. But the wing was angular and clumsy-seeming, and its form was devoid of the grace of an earthly aircraft wing, and there was no tail whatever to give it the appearance of a living thing. There was merely a long, rectangular wing with a framework beneath it, and a

shimmering thing which was certainly not a screw propeller, but which seemed to draw it.

It moved on steadily and swiftly, dwindling in the distance, with its motionless pilot seated before a mass of corded bundles. It looked as if this were a freight plane of some sort, and therefore made in a strictly utilitarian fashion.

It vanished in the haze above the monster swamp, going in a straight line for the golden city at the world's edge.

Tommy stared at it, long after it had ceased to be visible. Then he saw a queer movement on the earth near the edge of the morass. Figures were moving. Human figures. He saw four of them, shaking clenched fists and capering insanely, seeming to bellow insults after the oblivious and now invisible flying thing. He could see that they were nearly naked, and that one of them carried a spear. But the indubitable glint of metal was reflected from one of them for an instant, when some metal accoutrement about him glittered in the sunlight.

They moved from sight behind thick, feathery foliage, and Tommy swung back the brass tube to see the globe again. Denham and his daughter were staring in the direction in which Tommy had seen those human figures. Denham clutched his clumsy club grimly. His face was drawn and his figure tensed. And suddenly Evelyn spoke quietly, and the two of them dived into the fern forest and disappeared. Minutes later they returned, dragging masses of tree-fern fronds with which they masked the globe from view. They worked hastily, desperately, concealing the steel vehicle from sight. And then Denham stared tensely all about, shading his eyes with his hand. He and the girl withdrew cautiously into the forest.

It was minutes later that Tommy was roused by Von Holtz's hand on his shoulder.

"What has happened, Herr Reames?" he asked uneasily. "The—Ragged Men?"

"I saw men," said Tommy briefly, "shaking clenched fists at an aircraft flying overhead. And Denham and his daughter have hidden the globe behind a screen

of foliage.”

Von Holtz licked his lips fascinatedly.

“The Ragged Men,” he said in a hushed voice. “The Herr Professor called them that, because they cannot be of the people who live in the Golden City. They hate the people of the Golden City. I think that they are bandits; renegades, perhaps. They live in the tree-fern forests and scream curses at the airships which fly overhead. And they are afraid of those airships.”

“How long did Denham use this thing to look through, before he built his globe?”

Von Holtz considered.

“Immediately it worked,” he said at last, “he began work on a small catapult. It took him one week to devise exactly how to make that. He experimented with it for some days and began to make the large globe. That took nearly two months—the globe and the large catapult together. And also the dimensoscope was at hand. His daughter looked

through it more than he did, or myself.”

“He should have known what he was up against,” said Tommy, frowning. “He ought to have taken guns, at least. Is he armed?”

Von Holtz shook his head.

“He expected to return at once,” he said desperately. “Do you see, Herr Reames, the position it puts me in? I may be suspected of murder! I am the Herr Professor’s assistant. He disappears. Will I not be accused of having put him out of the way?”

“No,” said Tommy thoughtfully. “You won’t.” He glanced through the brass tube and paced up and down the room. “You telephone for someone to repair my car,” he said suddenly and abruptly. “I am going to stay here and work this thing out. I’ve got just the glimmering of an idea. But I’ll need my car in running order, in case we have to go out and get materials in a hurry.”

Von Holtz bowed stiffly and went out of the

laboratory. Tommy looked after him. Even moved to make sure he was gone. And then Tommy Reames went quickly to the work bench on which were the littered notes and calculations Von Holtz had been using and which were now at his disposal. But Tommy did not leaf through them. He reached under the blotter beneath the whole pile. He had seen Von Holtz furtively push something out of sight, and he had disliked and distrusted Von Holtz from the beginning. Moreover, it was pretty thoroughly clear that Denham had not trusted him too much. A trusted assistant should be able to understand, at least, any experiment performed in a laboratory.

A folded sheet of paper came out. Tommy glanced at it.

“You messed things up right! Denham marooned and you got nothing. No plans or figures either. When you get them, you get your money. If you don’t you are out of luck. If this Reames guy can’t fix up what you want it’ll be just too bad for you.”

There was no salutation nor any signature beyond a

scrawled and sprawling “J.”

Tommy Reames’ jaw set grimly. He folded the scrap of paper and thrust it back out of sight again.

“Pretty!” he said harshly. “So a gentleman named ‘J’ is going to pay Von Holtz for plans or calculations it is hoped I’ll provide! Which suggests—many things! But at least I’ll have Von Holtz’s help until he thinks my plans or calculations are complete. So that’s all right....”

Tommy could not be expected, of course, to guess that the note he had read was quite astounding proof of the interest taken in non-Euclidean geometry by a vice king of Chicago, or that the ranking beer baron of that metropolis was the man who was so absorbed in abstruse theoretic physics.

Tommy moved toward the great solenoid which lay askew upon its wrecked support. It had drawn the steel globe toward it, had made that globe vibrate madly, twice, and then go hazy and vanish. It had jerked the globe in each of five directions, each at

right angles to all the others, and had released it when started in the fifth dimension. The huge coil was quite nine feet across and would take the steel globe easily. It was pivoted in concentric rings which made up a set of gymbals far more elaborate than were ever used to suspend a mariner's compass aboard ship.

There were three rings, one inside the other. And two rings will take care of any motion in three dimensions. These rings were pivoted, too, so that an unbelievably intricate series of motions could be given to the solenoid within them all. But the device was broken, now. A pivot had given away, and shaft and socket alike had vanished. Tommy became absorbed. Some oddity bothered him....

He pieced the thing together mentally. And he exclaimed suddenly. There had been four rings of metal! One was gone! He comprehended, very suddenly. The third mirror in the dimensoscope was the one so strangely distorted by its position, which was at half of a right angle to all the dimensions of human experience. It was the third ring in the solenoid's supports which had vanished. And Tommy,

staring at the gigantic apparatus and summoning all his theoretic knowledge and all his brain to work, saw the connection between the two things.

“The time dimension and the world-line,” he said sharply, excited in spite of himself. “Revolving in the time dimension means telescoping in the world-line.... It would be a strain no matter could endure....”

The mirror in the dimensoscope was not pointing in a fourth dimension. It did not need to. It was reflecting light at a right angle, and hence needed to be only at half of a right angle to the two courses of the beam it reflected. But to whirl the steel globe into a fifth dimension, the solenoid’s support had for one instant to revolve in time! For the fraction of a second it would have literally to pass through its own substance. It would be required to undergo precisely the sort of strain involved in turning a hollow seamless metal globe, inside out! No metal could stand such a strain. No form of matter known to man could endure it.

“It would explode!” said Tommy excitedly to himself,

alone in the great bare laboratory. "Steel itself would vaporize! It would wreck the place!"

And then he looked blank. Because the place had very obviously not been wrecked. And yet a metal ring had vanished, leaving no trace....

Von Holtz came back. He looked frightened.

"A—a repairman, Herr Reames," he said, stammering, "is on the way. And—Herr Reames...."

Tommy barely heard him. For a moment, Tommy was all scientist, confronted with the inexplicable, yet groping with a blind certainty toward a conclusion he very vaguely foresaw. He waved his hand impatiently....

"The Herr Jacaro is on the way here," stammered Von Holtz.

Tommy blinked, remembering that Von Holtz had told him he could make a certain metal, the only metal which could be moved in the fourth dimension.

“Jacaro?” he said blankly.

“The—friend of the Herr Professor Denham. He advanced the money for the Herr Professor’s experiments.”

Tommy heard him with only half his brain, though that half instantly decided that Von Holtz was lying. The only Jacaro Tommy knew of was a prominent gangster from Chicago, who had recently cemented his position in Chicago’s underworld by engineering the amalgamation of two once-rival gangs. Tommy knew, in a vague fashion, that Von Holtz was frightened. That he was terrified in some way. And that he was inordinately suspicious of someone, and filled with a queer desperation.

“Well?” said Tommy abstractedly. The thought he needed was coming. A metal which would have full tensile strength up to a certain instant, and then disrupt itself without violence into a gas, a vapor.... It would be an alloy, perhaps. It would be....

He struck at his own head with his clenched fist,

angrily demanding that his brain bring forth the thought that was forming slowly. The metal that could be revolved in time without producing a disastrous explosion and without requiring an impossible amount of power....

He did not see Von Holtz looking in the eyepiece of the dimensoscope. He stared at nothing, thinking concentratedly, putting every bit of energy into sheer thought. And suddenly, like the explosion he sought a way to avoid, the answer came, blindingly clear.

He surveyed that answer warily. A tremendous excitement filled him.

“I’ve got it!” he said softly to himself. “By God, I know how he did the thing!”

And as if through a mist the figure of Von Holtz became clear before his eyes. Von Holtz was looking into the dimensoscope tube. He was staring into that other, extraordinary world in which Denham and his daughter were marooned. And Von Holtz’s face was utterly, deathly white, and he was making frantic,

repressed gestures, and whispering little whimpering phrases to himself. They were unintelligible, but the deathly pallor of his cheeks, and the fascinated, dribbling fullness of his lips brought Tommy Reames suddenly down to earth.

“What’s happening?” demanded Tommy sharply.

Von Holtz did not answer. He made disjointed, moaning little exclamations to himself. He was twitching horribly as he looked through the telescope into that other world....

Tommy flung him aside and clapped his own eye to the eyepiece. And then he groaned.

The telescope was pointed at the steel globe upon that ferny bank, no more than a few hundred yards away but two dimensions removed from Earth. The screening mass of tree-fronds had been torn away. A swarm of ragged, half-naked men was gathered about the globe. They were armed with spears and clubs, in the main, but there were other weapons of intricate design whose uses Tommy could not even guess at.

He did not try. He was watching the men as they swarmed about and over the steel sphere. Their faces were brutal and savage, and now they were distorted with an insane hate. It was the same awful, gibbering hatred he had sensed in the caperings of the four he had seen bellowing vituperation at an airplane.

They were not savages. Somehow he could not envision them as primitive. Their features were hard-bitten, seamed with hatred and with vice unspeakable. And they were white. The instant impression any man would have received was that here were broken men; fugitives, bandits, assassins. Here were renegades or worse from some higher, civilized race.

They battered hysterically upon the steel globe. It was not the attack of savages upon a strange thing. It was the assault of desperate, broken men upon a thing they hated. A glass pane splintered and crashed. Spears were thrust into the opening, while mouths opened as if in screams of insane fury. And then, suddenly, the door of the globe flew wide.

The Ragged Men did not wait for anyone to come out. They fought each other to get into the opening, their eyes glaring madly, filled with the lust to kill.

Chapter 3

A battered and antiquated flivver came chugging down the wire-fenced lane to the laboratory, an hour later. It made a prodigious din, and Tommy Reames went out to meet it. He was still a little pale. He had watched the steel globe turned practically inside out by the Ragged Men. He had seen them bringing out cameras, cushions, and even the padding of the walls, to be torn to bits in a truly maniacal fury. But he had not seen one sign of a human being killed. Denham and his daughter had not been in the globe when it was found and ransacked. So far, then, they were probably safe. Tommy had seen them vanish into the tree-fern forest. They had been afraid, and with good reason. What dangers they might encounter in the fern forest he could not guess. How long they would escape the search of the Ragged Men, he could not know. How he could ever hope to find them if he succeeded in duplicating Denham's dimension-traveling apparatus he could not even think of, just now. But the Ragged Men were not searching the fern forest. So much was sure. They were encamped by

the steel sphere, and a scurvy-looking lot they were.

Coming out of the brick laboratory, Tommy saw a brawny figure getting out of the antiquated flivver whose arrival had been so thunderous. That brawny figure nodded to him and grinned. Tommy recognized him. The red-headed, broad-shouldered filling station attendant in the last village, who had given him specific directions for reaching this place.

“You hit that gate a lick, didn’t you?” asked the erstwhile filling station attendant amiably. “Mr. Von Holtz said you had a flat and a busted radiator. That right?”

Tommy nodded. The red-headed man walked around the car, scratched his chin, and drew out certain assorted tools. He put them on the grass with great precision, pumped a gasoline blow-torch to pressure and touched a match to its priming-basin, and while the gasoline flamed smokily he made a half dozen casual movements with a file, and the broken radiator tube was exposed for repair.

He went back to the torch and observed placidly:

“The Professor ain’t around, is he?”

Tommy shook his head.

“Thought not,” said the red-headed one. “He gen’rally comes out and talks a while. I helped him build some of them dinkuses in the barn yonder.”

Tommy said eagerly:

“Say, which of those things did you help him build? That big thing with the solenoid—the coil?”

“Yeah. How’d it work?” The red-headed one set a soldering iron in place and began to jack up the rear wheel to get at the tire. “Crazy idea, if you ask me. I told Miss Evelyn so. She laughed and said she’d be in the ball when it was tried. Did it work?”

“Too damn well,” said Tommy briefly. “I’ve got to repair that solenoid. How about a job helping?”

The red-headed man unfastened the lugs of the rim, kicked the tire speculatively, and said, "Gone to hell." He put on the spare tire with ease and dispatch.

"Um," he said. "How about that Mr. Von Holtz? Is he goin' to boss the job?"

"He is not," said Tommy, with a shade of grimness in his tone.

The red-headed man nodded and took the soldering iron in hand. He unwound a strip of wire solder, mended the radiator tube with placid ease, and seemed to bang the cooling-flanges with a total lack of care. They went magically back into place, and it took close inspection to see that the radiator had been damaged.

"She's all right," he observed. He regarded Tommy impersonally. "Suppose you tell me how come you horn in on this," he suggested, "an' maybe I'll play. That guy Von Holtz is a crook, if you ask me about him."

Tommy ran his hand across his forehead, and told him.

“Um,” said the red-headed man calmly. “I think I’ll go break Mr. Von Holtz’s neck. I got me a hunch.”

He took two deliberate steps forward. But Tommy said:

“I saw Denham not an hour ago. So far, he’s all right. How long he’ll be all right is a question. But I’m going after him.”

The red-headed man scrutinized him exhaustively.

“Um. I might try that myself. I kinda like the Professor. An’ Miss Evelyn. My name’s Smithers. Let’s go look through the dinkus the Professor made.”

They went together into the laboratory. Von Holtz was looking through the dimensoscope. He started back as they entered, and looked acutely uneasy when he saw the red-headed man.

“How do you do,” he said nervously. “They—the Ragged Men—have just brought in a dead man. But it is not the Herr Professor.”

Without a word, Tommy took the brass tube in his hand. Von Holtz moved away, biting his lips. Tommy stared into that strange other world.

The steel sphere lay as before, slightly askew upon a bank of glossy ferns. But its glass windows were shattered, and fragments of everything it had contained were scattered about. The Ragged Men had made a camp and built a fire. Some of them were roasting meat—the huge limb of a monstrous animal with a scaly, reptilian hide. Others were engaged in vehement argument over the body of one of their number, lying sprawled out upon the ground.

Tommy spoke without moving his eyes from the eyepiece.

“I saw Denham with a club just now. This man was killed by a club.”

The Ragged Men in the other world debated acrimoniously. One of them pointed to the dead man's belt, and spread out his hands. Something was missing from the body. Tommy saw, now, three or four other men with objects that looked rather like policemen's truncheons, save that they were made of glittering metal. They were plainly weapons. Denham, then, was armed—if he could understand how the weapon was used.

The Ragged Men debated, and presently their dispute attracted the attention of a man with a huge black beard. He rose from where he sat gnawing at a piece of meat and moved grandly toward the disputatious group. They parted at his approach, but a single member continued the debate against even the bearded giant. The bearded one plucked the glittering truncheon from his belt. The disputatious one gasped in fear and flung himself desperately forward. But the bearded man kept the truncheon pointed steadily.... The man who assailed him staggered, reached close enough to strike a single blow, and collapsed. The bearded man pointed the metal truncheon at him as

he lay upon the ground. He heaved convulsively, and was still.

The bearded man went back to his seat and picked up the gnawed bit of meat again. The dispute had ceased. The chattering group of men dispersed.

Tommy was about to leave the eyepiece of the instrument when a movement nearby caught his eye. A head peered cautiously toward the encampment. A second rose beside it. Denham and his daughter Evelyn. They were apparently no more than thirty feet from the dimensoscope. Tommy could see them talking cautiously, saw Denham lift and examine a metal truncheon like the bearded man's, and force his daughter to accept it. He clutched a club, himself, with a grim satisfaction.

Moments later they vanished quietly in the thick fern foliage, and though Tommy swung the dimensoscope around in every direction, he could see nothing of their retreat.

He rose from that instrument with something

approaching hopefulness. He'd seen Evelyn very near and very closely. She did not look happy, but she did look alert rather than worn. And Denham was displaying a form of competence in the face of danger which was really more than would have been expected in a Ph.D., a M.A., and other academic distinctions running to most of the letters of the alphabet.

"I've just seen Denham and Evelyn again," said Tommy crisply. "They're safe so far. And I've seen one of the weapons of the Ragged Men in use. If we can get a couple of automatics and some cartridges to Denham, he'll be safe until we can repair the big solenoid."

"There was the small catapult," said Von Holtz bitterly, "but it was dismantled. The Herr Professor saw me examining it, and he dismantled it. So that I did not learn how to calculate the way of changing the position—"

Tommy's eyes rested queerly on Von Holtz for a moment.

"You know how to make the metal required," he said suddenly. "You'd better get busy making it. Plenty of it. We'll need it."

Von Holtz stared at him, his weak eyes almost frightened.

"You *know*? You know how to combine the right angles?"

"I think so," said Tommy. "I've got to find out if I'm right. Will you make the metal?"

Von Holtz bit at his too-red lips.

"But Herr Reames!" he said stridently, "I wish to know the equation! Tell me the method of pointing a body in a fourth or a fifth direction. It is only fair—"

"Denham didn't tell you," said Tommy.

Von Holtz's arms jerked wildly.

"But I will not make the metal! I insist upon being told the equation! I insist upon it! I will not make the metal if you do not tell me!"

Smithers was in the laboratory, of course. He had been surveying the big solenoid-catapult and scratching his chin reflectively. Now he turned.

But Tommy took Von Holtz by the shoulders. And Tommy's hands were the firm and sinewy hands of a sportsman, if his brain did happen to be the brain of a scientist. Von Holtz writhed in his grip.

"There is only one substance which could be the metal I need, Von Holtz," he said gently. "Only one substance is nearly three-dimensional. Metallic ammonium! It's known to exist, because it makes a mercury amalgam, but nobody has been able to isolate it because nobody has been able to give it a fourth dimension—duration in time. Denham did it. You can do it. And I need it, and you'd better set to work at the job. You'll be very sorry if you don't, Von

Holtz!”

Smithers said with a vast calmness.

“I got me a hunch. So if y’want his neck broke....”

Tommy released Von Holtz and the lean young man gasped and sputtered and gesticulated wildly in a frenzy of rage.

“He’ll make it,” said Tommy coldly. “Because he doesn’t dare not to!”

Von Holtz went out of the laboratory, his weak-looking eyes staring and wild, and his mouth working.

“He’ll be back,” said Tommy briefly. “You’ve got to make a small model of that big catapult, Smithers. Can you do it?”

“Sure,” said Smithers. “The ring’ll be copper tubing, with pin-bearings. Wind a coil on the lathe. It’ll be kinda rough, but it’ll do. But gears, now....”

“I’ll attend to them. You know how to work that metallic ammonium?”

“If that’s what it was,” agreed Smithers. “I worked it for the Professor.”

Tommy leaned close and whispered:

“You never made any gears of that. But did you make some springs?”

“Uh-huh!”

Tommy grinned joyously.

“Then we’re set and I’m right! Von Holtz wants a mathematical formula, and no one on earth could write one, but we don’t need it!”

Smithers rummaged around the laboratory with a casual air, acquired this and that and the other thing, and set to work with an astounding absence of waste motions. From time to time he inspected the great catapult thoughtfully, verified some impression, and

went about the construction of another part.

And when Von Holtz did not return, Tommy hunted for him. He suddenly remembered hearing his car motor start. He found his car missing. He swore, then, and grimly began to hunt for a telephone in the house. But before he had raised central he heard the deep-toned purring of the motor again. His car was coming swiftly back to the house. And he saw, through a window, that Von Holtz was driving it.

The lean young man got out of it, his face white with passion. He started for the laboratory. Tommy intercepted him.

“I—went to get materials for making the metal,” said Von Holtz hoarsely, repressing his rage with a great effort. “I shall begin at once, Herr Reames.”

Tommy said nothing whatever. Von Holtz was lying. Of course. He carried nothing in the way of materials. But he had gone away from the house, and Tommy knew as definitely as if Von Holtz had told him, that Von Holtz had gone off to communicate in safety with

someone who signed his correspondence with a J.

Von Holtz went into the laboratory. The four-cylinder motor began to throb at once. The whine of the dynamo arose almost immediately after. Von Holtz came out of the laboratory and dived into a shed that adjoined the brick building. He remained in there.

Tommy looked at the trip register on his speedometer. Like most people with methodical minds, he had noted the reading on arriving at a new destination. Now he knew how far Von Holtz had gone. He had been to the village and back.

“Meaning,” said Tommy grimly to himself, “that the J who wants plans and calculations is either in the village or at the end of a long-distance wire. And Von Holtz said he was on the way. He’ll probably turn up and try to bribe me.”

He went back into the laboratory and put his eye to the eyepiece of the dimensoscope. Smithers had his blow-torch going and was busily accumulating an apparently unrelated series of discordant bits of

queerly-shaped metal. Tommy looked through at the strange mad world he could see through the eyepiece.

The tree-fern forest was still. The encampment of the Ragged Men was nearly quiet. Sunset seemed to be approaching in this other world, though it was still bright outside the laboratory. The hours of day and night were obviously not the same in the two worlds, so close together that a man could be flung from one to the other by a mechanical contrivance.

The sun seemed larger, too, than the orb which lights our normal earth. When Tommy swung the vision instrument about to search for it, he found a great red ball quite four times the diameter of our own sun, neatly bisected by the horizon. Tommy watched, waiting for it to sink. But it did not sink straight downward as the sun seems to do in all temperate latitudes. It descended, yes, but it moved along the horizon as it sank. Instead of a direct and forthright dip downward, the sun seemed to progress along the horizon, dipping more deeply as it swam. And Tommy watched it blankly.

“It’s not our sun.... But it’s not our world. Yet it revolves, and there are men on it. And a sun that size would bake the earth.... And it’s sinking at an angle that would only come at a latitude of—”

That was the clue. He understood at once. The instrument through which he regarded the strange world looked out upon the polar regions of that world. Here, where the sun descended slantwise, were the high latitudes, the coldest spaces upon all the whole planet. And if here there were the gigantic growths of a carboniferous era, the tropic regions of this planet must be literal infernos.

And then he saw in its gradual descent the monster sun was going along behind the golden city, and the outlines of its buildings, the magnificence of its spires, were limned clearly for him against the dully glowing disk.

Nowhere upon earth had such a city ever been dreamed of. No man had ever envisioned such a place, where far-flung arches interconnected soaring, towering columns, where curves of perfect grace

were united in forms of utterly perfect proportion....

The sunlight died, and dusk began and deepened, and vividly brilliant stars began to come out overhead, and Tommy suddenly searched the heavens eagerly for familiar constellations. And found not one. All the stars were strange. These stars seemed larger and much more near than the tiny pinpoints that blink down upon our earth.

And then he swung the instrument again and saw great fires roaring and the Ragged Men crouched about them. Within them, rather, because they had built fires about themselves as if to make a wall of flame. And once Tommy saw twin, monstrous eyes, gazing from the blackness of the tree-fern forest. They were huge eyes, and they were far apart, so that the head of the creature who used them must have been enormous. And they were all of fifteen feet above the ground when they speculatively looked over the ring of fires and the ragged, degraded men within them. Then that creature, whatever it was, turned

away and vanished.

But Tommy felt a curious shivering horror of the thing. It had moved soundlessly, without a doubt, because not one of the Ragged Men had noted its presence. It had been kept away by the fires. But Denham and Evelyn were somewhere in the tree-fern forest, and they would not dare to make fires....

Tommy drew away from the dimensoscope, shivering. He had been looking only, but the place into which he looked was real, and the dangers that lay hidden there were very genuine, and there was a man and a girl of his own race and time struggling desperately, without arms or hope, to survive.

Smithers was casually fitting together an intricate array of little rings made of copper tubing. There were three of them, and each was fitted into the next largest by pins which enabled them to spin noiselessly and swiftly at the touch of Smithers' finger. He had them spinning now, each in a separate direction, and the effect was bewildering.

As Tommy watched, Smithers stopped them, oiled the pins carefully, and painstakingly inserted a fourth ring. Only this ring was of a white metal that looked somehow more pallid than silver. It had a whiteness like that of ivory beneath its metallic gleam.

Tommy blinked.

“Did Von Holtz give you that metal?” he asked suddenly.

Smithers looked up and puffed at a short brown pipe.

“Nope. There was some splashes of it by the castin’ box. I melted ’em together an’ run a ring. Pressed it to shape; y’ can’t hammer this stuff. It goes to water and dries up quicker’n lightning—an’ you hold y’nose an’ run. I used it before for the Professor.”

Tommy went over to him excitedly. He picked up the little contrivance of many concentric rings. The big motor was throbbing rhythmically, and the generator was humming at the back of the laboratory. Von Holtz was out of sight.

With painstaking care Tommy went over the little device. He looked up.

“A coil?”

“I wound one,” said Smithers calmly. “On the lathe. Not so hot, but it’ll do, I guess. But I can’t fix these rings like the Professor did.”

“I think I can,” said Tommy crisply. “Did you make some wire for springs?”

“Yeah!”

Tommy fingered the wire. Stout, stiff, and surprisingly springy wire of the same peculiar metal. It was that metallic ammonium which chemists have deduced must exist because of the chemical behavior of the compound NH_3 , but which Denham alone had managed to procure. Tommy deduced that it was an allotropic modification of the substance which forms an amalgam with mercury, as metallic tin is an allotrope of the amorphous gray powder which is tin in its normal, stable state.

He set to work with feverish excitement. For one hour, for two he worked. At the end of that time he was explaining the matter curtly to Smithers, so intent on his work that he wholly failed to hear a motor car outside or to realize that it had also grown dark in this world of ours.

“You see, Smithers, if a two-dimensioned creature wanted to adjust two right angles at right angles to each other, he’d have them laid flat, of course. And if he put a spring at the far ends of those right angles—they’d look like a T, put together—so that the cross-bar of that T was under tension, he’d have the equivalent of what I’m doing. To make a three-dimensioned figure, that imaginary man would have to bend one side of the cross-bar up. As if the two ends of it were under tension by a spring, and the spring would only be relieved of tension when that cross-bar was bent. But the vertical would be his time dimension, so he’d have to have something thin, or it couldn’t be bent. He’d need something ‘thin in time.’

“We have the same problem. But metallic ammonium is ‘thin in time.’ It’s so fugitive a substance that

Denham is the only man ever to secure it. So we use these rings and adjust these springs to them so they're under tension which will only be released when they're all at right angles to each other. In our three dimensions that's impossible, but we have a metal that can revolve in a fourth, and we reinforce their tendency to adjust themselves by starting them off with a jerk. We've got 'em flat. They'll make a good stiff jerk when they try to adjust themselves. And the solenoid's a bit eccentric—"

"Shut up!" snapped Smithers suddenly.

He was facing the door, bristling. Von Holtz was in the act of coming in, with a beefy, broad-shouldered man with blue jowls. Tommy straightened up, thought swiftly, and then smiled grimly.

"Hullo, Von Holtz," he said pleasantly. "We've just completed a model catapult. We're all set to try it out. Watch!"

He set a little tin can beneath the peculiar device of copper-tubing rings. The can was wholly ordinary,

made of thin sheet-iron plated with tin as are all the tin cans of commerce.

“You have the catapult remade?” gasped Von Holtz.
“Wait! Wait! Let me look at it!”

For one instant, and one instant only, Tommy let him see. The massed set of concentric rings, each one of them parallel to all the others. It looked rather like a flat coil of tubing; certainly like no particularly obscure form of projector. But as Von Holtz’s weak eyes fastened avidly upon it, Tommy pressed the improvised electric switch. At once that would energize the solenoid and release all the tensed springs from their greater tension, for an attempt to reach a permanent equilibrium.

As Von Holtz and the blue-jowled man stared, the little tin can leaped upward into the tiny coil. The small copper rings twinkled one within the other as the springs operated. The tin can was wrenched this way and that, then for the fraction of a second hurt the eyes that gazed upon it—and it was gone! And then the little coil came spinning down to the work

bench top from its broken bearings and the remaining copper rings spun aimlessly for a moment. But the third ring of whitish metal had vanished utterly, and so had the coiled-wire springs which Von Holtz had been unable to distinguish. And there was an overpowering smell of ammonia in the room.

Von Holtz flung himself upon the still-moving little instrument. He inspected it savagely, desperately. His full red lips drew back in a snarl.

“How did you do it?” he cried shrilly. “You must tell me! I—I—I will kill you if you do not tell me!”

The blue-jowled man was watching Von Holtz. Now his lips twisted disgustedly. He turned to Tommy and narrowed his eyes.

“Look here,” he rumbled. “This fool’s no good! I want the secret of that trick you did. What’s your price?”

“I’m not for sale,” said Tommy, smiling faintly.

The blue-jowled man regarded him with level eyes.

“My name’s Jacaro,” he said after an instant. “Maybe you’ve heard of me. I’m from Chicago.”

Tommy smiled more widely.

“To be sure,” he admitted. “You were the man who introduced machine-guns into gang warfare, weren’t you? Your gunmen lined up half a dozen of the Buddy Haines gang against a wall and wiped them out, I believe. What do you want this secret for?”

The level eyes narrowed. They looked suddenly deadly.

“That’s my business,” said Jacaro briefly. “You know who I am. And I want that trick y’did. I got my own reasons. I’ll pay for it. Plenty. You know I got plenty to pay, too. Or else—”

“What?”

“Something’ll happen to you,” said Jacaro briefly. “I ain’t sayin’ what. But it’s damn likely you’ll tell what I want to know before it’s finished. Name your price

and be damn quick!”

Tommy took his hand out of his pocket. He had a gun in it.

“The only possible answer to that,” he said suavely, “is to tell you to go to hell. Get out! But Von Holtz stays here. He’d better!”

Chapter 4

Within half an hour after Jacaro's leaving, Smithers was in the village, laying in a stock of supplies and sending telegrams that Tommy had written out for transmission. Tommy sat facing an ashen Von Holtz and told him pleasantly what would be done to him if he failed to make the metallic ammonium needed to repair the big solenoid. In an hour, Smithers was back, reporting that Jacaro was also sending telegrams but that he, Smithers, had stood over the telegraph operator until his own messages were transmitted. He brought back weapons, too—highly illegal things to have in New York State, where a citizen is only law-abiding when defenseless. And then four days of hectic, sleepless labor began.

On the first day one of Tommy's friends drove in in answer to a telegram. It was Peter Dalzell, with men in uniform apparently festooned about his car. He announced that a placard warning passersby of smallpox within, had been added to the decorative signs upon the gate, and stared incredulously at the interior of the big brick barn. Tommy grinned at him

and gave him plans and specifications of a light steel globe in which two men might be transported into the fifth dimension by a suitably operating device. Tommy had sat up all night drawing those plans. He told Dalzell just enough of what he was up against to enlist Dalzell's enthusiastic cooperation without permitting him to doubt Tommy's sanity. Dalzell had known Tommy as an amateur tennis player, but not as a scientist.

He marveled, refused to believe his eyes when he looked through the dimensoscope, and agreed that the whole thing had to be kept secret or the rescue expedition would be prevented from starting by the incarceration of both Tommy and Smithers in comfortable insane asylums. He feigned to admire Von Holtz, deathly white and nearly frantic with a corroding rage, and complimented Tommy on his taste for illegality. He even asked Von Holtz if he wanted to leave, and Von Holtz snarled insults at him. Von Holtz was beginning to work at the manufacture of metallic ammonium.

It was an electrolytic process, of course. Ordinarily, when—say—ammonium chloride is broken down by an electric current, ammonium is deposited at the cathode and instantly becomes a gas which dissolves in the water or bubbles up to the surface. With a mercury cathode, it is dissolved and becomes a metallic amalgam, which also breaks down into gas with much bubbling of the mercury. But Denham had worked out a way of delaying the breaking-down, which left him with a curiously white, spongy mass of metal which could be carefully melted down and cast, but not under any circumstances violently struck or strained.

Von Holtz was working at that. On the second day he delivered, snarling, a small ingot of the white metal. He was imprisoned in the lean-to-shed in which the electrolysis went on. But Tommy had more than a suspicion that he was in communication with Jacaro.

“Of course,” he said drily to Smithers, who had expressed his doubts. “Jacaro had somebody sneak up and talk to him through the walls, or maybe through a bored hole. While there’s a hope of finding out what

he wants to know through Von Holtz, Jacaro won't try anything. Not anything rough, anyhow. We mustn't be bumped off while what we are doing is in our heads alone. We're safe enough—for a while."

Smithers grumbled.

"We need that ammonium," said Tommy, "and I don't know how to make it. I bluffed that I could, and in time I might, but it would need time and meanwhile Denham needs us. Dalzell is going to send a plane over today, with word of when we can expect our own globe. We'll try to have the big catapult ready when it comes. And the plane will drop some extra supplies. I've ordered a sub-machine gun. Handy when we get over there in the tree-fern forests. Right now, though, we need to be watching...."

Because they were taking turns looking through the dimensoscope. For signs of Denham and Evelyn. And Tommy was finding himself thinking wholly unscientific thoughts about Evelyn, since a pretty girl in difficulties is of all possible things the one most likely to make a man romantic.

In the four days of their hardest working, he saw her three times. The globe was wrecked and ruined. Its glass was broken out and its interior ripped apart. It had been pillaged so exhaustively that there was no hope that whatever device had been included in its design, for its return, remained even repairably intact. That device had not worked, to be sure, but Tommy puzzled sometimes over the fact that he had seen no mechanical device of any sort in the plunder that had been brought out to be demolished. But he did not think of those things when he saw Evelyn.

The Ragged Men's encampment was gone, but she and her father lingered furtively, still near the pillaged globe. The first day Tommy saw her, she was still blooming and alert. The second day she was paler. Her clothing was ripped and torn, as if by thorns. Denham had a great raw wound upon his forehead, and his coat was gone and half his shirt was in ribbons. Before Tommy's eyes they killed a nameless small animal with the trunchionlike weapon Evelyn carried. And Denham carted it triumphantly off into the shelter of the tree-fern forest. But to

Tommy that shelter began to appear extremely dubious.

That same afternoon some of the Ragged Men came suspiciously to the globe and inspected it, and then vented a gibbering rage upon it with blows and curses. They seemed half-mad, these men. But then, all the Ragged Men seemed a shade less than sane. Their hatred for the Golden City seemed the dominant emotion of their existence.

And when they had gone, Tommy saw Denham peering cautiously from behind a screening mass of fern. And Denham looked sick at heart. His eyes lifted suddenly to the heavens, and he stared off into the distance again, and then he regarded the heavens again with an expression that was at once of the utmost wistfulness and the uttermost of despair.

Tommy swung the dimensoscope about and searched the skies of that other world. He saw the flying machine, and it was a swallow-winged device that moved swiftly, and now soared and swooped in abrupt short circles almost overhead. Tommy could see its

pilot, leaning out to gaze downward. He was no more than a hundred feet up, almost at the height of the tree-fern tops. And the pilot was moving too swiftly for Tommy to be able to focus accurately upon his face, but he could see him as a man, an indubitable man in no fashion distinguishable from the other men of this earth. He was scrutinizing the globe as well as he could without alighting.

He soared upward, suddenly, and his plane dwindled as it went toward the Golden City.

And then, inevitably, Tommy searched for the four Ragged Men who had inspected the globe a little while since. He saw them, capering horribly behind a screening of verdure. They did not shake their clenched fists at the flying machine. Instead, they seemed filled with a ghastly mirth. And suddenly they began to run frantically for the far distance, as if bearing news of infinite importance.

And when he looked back at Denham, it seemed to Tommy that he wrung his hands before he disappeared.

But that was the second day of the work upon our own world, and just before sunset there was a droning in the earthly sky above the laboratory, and Tommy ran out, and somebody shot at him from a patch of woodland a quarter of a mile away from the brick building. Isolated as Denham's place was, the shot would go unnoticed. The bullet passed within a few feet of Tommy, but he paid no attention. It was one of Jacaro's watchers, no doubt, but Jacaro did not want Tommy killed. So Tommy waited until the plane swooped low—almost to the level of the laboratory roof—and a thickly padded package thudded to the ground. He picked it up and darted back into the laboratory as other bullets came from the patch of woodland.

“Funny,” he said dryly to Smithers, inside the laboratory again; “they don't dare kill me—yet—and Von Holtz doesn't dare leave or refuse to do what I tell him to do; and yet they expect to lick us.”

Smithers growled. Tommy was unpacking the wrapped package. A grim, blued-steel thing came out of much padding. Boxes tumbled after it.

“Sub-machine gun,” said Tommy, “and ammunition. Jacaro and his little pals will try to get in here when they think we’ve got the big solenoid ready for use. They’ll try to get it before we can use it. This will attend to them.”

“An’ get us in jail,” said Smithers calmly, “for forty-’leven years.”

“No,” said Tommy, and grinned. “We’ll be in the fifth dimension. Our job is to fling through the catapult all the stuff we’ll need to make another catapult to fling us back again.”

“It can’t be done,” said Smithers flatly.

“Maybe not,” agreed Tommy, “especially since we ruin all our springs and one gymbal ring every time we use the thing. But I’ve got an idea. I’ll want five coils with hollow iron cores, and the whole works shaped like this, with two holes bored so....”

He sketched. He had been working on the idea for several days, and the sketch was ready in his mind to

be transferred to paper.

“What you goin’ to do?”

“Something crazy,” said Tommy. “A mirror isn’t the only thing that changes angles to right ones.”

“You’re the doctor,” said the imperturbable Smithers.

He set to work. He puzzled Tommy sometimes, Smithers did. So far he hadn’t asked how much his pay was going to be. He’d worked unintermittantly. He had displayed a colossal, a tremendous calmness. But no man could work as hard as Smithers did without some powerful driving-force. It was on the fourth day that Tommy learned what it was.

The five coils had been made, and Tommy was assembling them with an extraordinary painstaking care behind a screen, to hide what he was doing. He’d discovered a peep-hole bored through the brick wall from the lean-to where Von Holtz worked. He was no longer locked in there. Tommy abandoned the pretense of imprisonment after finding an automatic

pistol and a duplicate key to the lock in Von Holtz's possession. He'd had neither when he was theoretically locked up, and Tommy laughed.

"It's a farce, Von Holtz," he said dryly, "this pretending you'll run away. You're here spying now, for Jacaro. Of course. And you don't dare harm either of us until you find out from me what you can't work out for yourself, and know I have done. How much is Jacaro going to pay you for the secret of the catapult, Von Holtz?"

Von Holtz snarled. Smithers moved toward him, his hands closing and unclosing. Von Holtz went gray with terror.

"Talk!" said Smithers.

"A—a million dollars," said Von Holtz, cringing away from the brawny red-headed man.

"It would be interesting to know what use it would be to him," said Tommy dryly. "But to earn that million you have to learn what we know. And to learn that,

you have to help us do it again, on the scale we want. You won't run away. So I shan't bother to lock you up hereafter. Jacaro's men come and talk to you at night, don't they?"

Von Holtz cringed again. It was an admission.

"I don't want to have to kill any of them," said Tommy pleasantly, "and we'll all be classed as mad if this thing gets out. So you go and talk to them in the lane when you want to, Von Holtz. But if any of them come near the laboratory, Smithers and I will kill them, and if Smithers is hurt I'll kill you; and I don't imagine Jacaro wants that, because he expects you to build another catapult for him. But I warn you, if I find another gun on you I'll thrash you."

Von Holtz's pallor changed subtly from the pallor of fear to the awful lividness of rage.

"You—Gott! You dare threaten—" He choked upon his own fury.

"I do," said Tommy. "And I'll carry out the threat."

Smithers moved forward once more.

“Mr. Von Holtz,” he said in a very terrible steadiness, “I aim to kill you some time. I ain’t done it yet because Mr. Reames says he needs you a while. But I know you got Miss Evelyn marooned off in them fern-woods on purpose! And—God knows she wouldn’t ever look at me, but—I aim to kill you some time!”

His eyes were flames. His hands closed and unclosed horribly. Von Holtz gaped at him, shocked out of his fury into fear again. He went unsteadily back to his lean-to. And Smithers went back to the dimensoscope. It was his turn to watch that other world for signs of Denham and Evelyn, and for any sign of danger to them.

Tommy adjusted the screen before the bench on which he was working, so Von Holtz could not see his task, and went back to work. It was a rather intricate task he had undertaken, and before the events of the past few days he would have said it was insane. But now he was taking it quite casually.

Presently he said:

“Smithers.”

Smithers did not look away from the brass tube.

“Yeah?”

“You’re thinking more about Miss Denham than her father.”

Smithers did not reply for a moment. Then he said:

“Well? What if I am?”

“I am, too,” said Tommy quietly. “I’ve never spoken to her, and I daresay she’s never even heard of me, and she certainly has never seen me, but—”

Smithers said with a vast calmness:

“She’ll never look at me, Mr. Reames. I know it. She talks to me, an’ laughs with me, but she’s never sure-’nough looked at me. An’ she never will. But I got the right to love her.”

Tommy nodded very gravely.

“Yes. You have. So have I. And so, when that globe comes, we both get into it with what arms and ammunition we can pack in, and go where she is, to help her. I intended to have you work the switch and send me off. But you can come, too.”

Smithers was silent. But he took his eyes from the dimensoscope eye-piece and regarded Tommy soberly. Then he nodded and turned back. And it was a compact between the two men that they should serve Evelyn, without any rivalry at all.

Tommy went on with his work. The essential defect in the catapult Denham had designed was the fact that it practically had to be rebuilt after each use. And, moreover, the metallic ammonium was so fugitive a substance that it was hard to keep. Once it had been strained by working, it gradually adverted to a gaseous state and was lost. And while he still tried to keep the little catapult in a condition for use, he was at no time sure that he could send a pair of automatics and ammunition through in a steel box at

any moment that Denham came close enough to notice a burning smoke-fuse attached.

But he was working on another form of catapult entirely, now. In this case he was using hollow magnets placed at known angles to each other. And they were so designed that each one tended to adjust its own hollow bore at right angles to the preceding one, and each one would take any moving, magnetic object and swing it through four successive right angles into the fifth dimension.

He fitted the first magnet on twin rods of malleable copper, which also would carry the current which energized the coil. He threaded the second upon the same twin supports. When the current was passed through the two of them, the magnetic field itself twisted the magnets, bending the copper supports and placing the magnets in their proper relative positions. A third magnet on the same pair of rods, and a repetition of the experiment, proved the accuracy of the idea. And since this device, like the dimensoscope, required only a forty-five degree angle to our known dimensions, instead of a right angle as

the other catapult did, Tommy was able to work with ordinary and durable materials. He fitted on the last two coils and turned on the current for his final experiment. And as he watched, the twin three-eighths-inch rods twisted and writhed in the grip of the intangible magnetic force. They bent, and quivered, and twisted.... And suddenly there seemed to be a sort of inaudible *snap*, and one of the magnets hurt the eyes that looked at it, and only the edge of the last of the series was visible.

Tommy drew in his breath sharply. "Now we try it," he said tensely. "I was trying to work this as the mirrors of the dimensoscope were fitted. Let's see."

He took a long piece of soft-iron wire and fed it into the hollow of the first magnet. He saw it come out and bend stiffly to enter the hollow of the second. It required force to thrust it through. It went still more stiffly into the third magnet. It required nearly all his strength to thrust it on, and on.... The end of it vanished. He pushed two feet or more of it beyond the last place where it was visible. It went into the magnet that hurt one's eyes. After that it could not be

seen.

Tommy's voice was strained.

"Swing the dimensoscope, Smithers," he ordered.

"See if you can see the wire. The end of it should be in the other world."

It seemed an age, an aeon, that Smithers searched. Then:

"Move it," he said.

Tommy obeyed.

"It's there," said Smithers evenly. "Two or three feet of it."

Tommy drew a deep, swift breath of relief.

"All right!" he said crisply. "Now we can fling anything we need through there, when our globe arrives. We can built up a dump of supplies, all sent through just before we slide through in the globe."

“Yeah,” said Smithers. “Uh—Mr. Reames. There’s a bunch of Ragged Men in sight, hauling something heavy behind them. I don’t know what it’s all about.”

Tommy went to the brass tube and stared through it. The tree-fern forest, drawing away in the distance. The vast and steaming morass. The glittering city, far, far in the distance.

And then a mob of the Ragged Men, hauling at some heavy thing. They were a long way off. Some of them came capering on ahead, and Tommy swung the dimensoscope about to see Denham and Evelyn dart for cover and vanish amid the tree-ferns. Denham was as ragged as the Ragged Men, by now, and Evelyn’s case was little better.

Frightened for them, Tommy swung the instrument about again. But they had not been seen. The leaders who ran gleefully on ahead were merely in haste. And they were followed more slowly by burly men and lean ones, whole men and limping men, who hauled frantically on long ropes of hide, dragging some heavy thing behind them. Tommy saw it only indistinctly as

the filthy, nearly naked bodies moved. But it was an intricate device of a golden-colored metal, and it rested upon the crudest of possible carts. The wheels were sections of tree trunks, pierced for wooden axles. The cart itself was made of the most roughly-hewed of timbers. And there were fifty or more of the Ragged Men who dragged it.

The men in advance now attacked the underbrush at the edge of the forest. They worked with a maniacal energy, clearing away the long fern-fronds while they capered and danced and babbled excitedly.

Irrelevantly, Tommy thought of escaped galley slaves. Just such hard-bitten, vice-ridden men as these, and filled with just such a mad, gibbering hatred of the free men they had escaped from. Certainly these men had been civilized once. As the golden-metal device came nearer, its intricacy was the more apparent. No savages could utilize a device like this one. And there was a queer deadliness in the very grace of its outlines. It was a weapon of some sort, but whose nature Tommy could not even guess.

And then he caught the gleam of metal also in the fern-forest. On the ground. In glimpses and in fragments of glimpses between the swarming naked bodies of the Ragged Men, he pieced together a wholly incredible impression. There was a roadway skirting the edge of the forest. It was not wide; not more than fifteen feet at most. But it was a solid road-bed of metal! The dull silver-white of aluminum gleamed from the ground. Two or more inches thick and fifteen feet wide, there was a seamless ribbon of aluminum that vanished behind the tree-ferns on either side.

The intricate device of golden metal was set up, now, and a shaggy, savage-seeming man mounted beside it grinning. He manipulated its levers and wheels with an expert's assurance. And Tommy saw repairs upon it. Crude repairs, with crude materials, but expertly done. Done by the Ragged Men, past doubt, and so demolishing any idea that they came of a savage race.

"Watch here, Smithers," said Tommy grimly.

He sat to work upon the little catapult after Denham's

design. His own had seemed to work, but the other was more sure. This would be an ambush the Ragged Men were preparing, and of course they would be preparing it for men of the Golden City. The plane had sighted Denham's steel globe. It had hovered overhead, and carried news of what it had seen to the Golden City. And here was a roadway that must have been made by the folk of the Golden City at some time or another. Its existence explained why Denham remained nearby. He had been hoping that some vehicle would travel along its length, containing civilized people to whom he could signal and ultimately explain his plight. And, being near the steel globe, his narrative would have its proofs at hand.

And now it was clear that the Ragged Men expected some ground-vehicle, too. They were preparing for it. They were setting a splendid ambush, with a highly-treasured weapon they ordinarily kept hidden. Their triumphant hatred could apply to nothing else than an expectation of inflicting injury on men of the Golden City.

So Tommy worked swiftly upon the catapult. A new

little ring of metallic ammonium was ready, and so were the necessary springs. The Ragged Men would lay their ambush. The men of the Golden City might enter it. They might. But the aviator who had spotted the globe would have seen the shredded contents of the sphere about. He would have known the Ragged Men had found it. And the men who came in a ground-vehicle from the Golden City should be expecting just such an ambush as was being laid.

There would be a fight, and Tommy, somehow, had no doubt that the men of the Golden City would win. And when they had cleared the field he would fling a smoking missile through the catapult. The victors should see it and should examine it. And though writing would serve little purpose, they should at least recognize it as written communication in a language other than their own. And mathematical diagrams would certainly be lucid, and proof of a civilized man sending the missile, and photographs....

The catapult was ready, and Tommy prepared his message-carrying projectile. He found snapshots and included them. He tore out a photograph of Evelyn

and her father, which had been framed above a work bench in the laboratory. He labored, racking his brain for a means of conveying the information that the globe was of any other world.... And suddenly he had an idea. A cord attached to his missile would lead to nothingness from either world, yet one end would be in that other world, and the other end in this. A wire would be better. Tugs upon it would convey the idea of living beings nearby but invisible. The photograph would identify Denham and his daughter as associated with the phenomenon and competent to explain it....

Tommy worked frantically to get the thing ready. He almost prayed that the men of the Golden City would be victors, would find his little missile when the fray was over, and would try to comprehend it....

All he could do was try.

Then Smithers said, from the dimensoscope:

“They’re all set, Mr. Reames. Y’better look.”

Tommy stared through the eye-piece. Strangely, the golden weapon had vanished. All seemed to be exactly as before. The cleared-away underbrush was replaced. Nothing was in any way changed from the normal in that space upon a mad world. But there was a tiny movement and Tommy saw a Ragged Man. He was lying prone upon the earth. He seemed either to hear or see something, because his lips moved as he spoke to another invisible man beside him, and his expression of malevolent joy was horrible.

Tommy swung the tube about. Nothing.... But suddenly he saw swiftly-moving winkings of sunlight from the edge of the tree-fern forest. Something was moving in there, moving with lightning swiftness along the fifteen-foot roadway of solid aluminum. It drew nearer, and more near....

The carefully camouflaged ambushade was fully focussed and Tommy was watching tensely when the thing happened.

He saw glitterings through the tree-fronds come to a smoothly decelerated stop. There was a pause; and

suddenly the underbrush fell flat. As if a single hand had smitten it, it wavered, drooped, and lay prone. The golden weapon was exposed, with its brawny and horribly grinning attendant. For one-half a split second Tommy saw the wheeled thing in which half a dozen men of the Golden City were riding. It was graceful and stream-lined and glittering. There was a platform on which the steel sphere would have been mounted for carrying away.

But then there was a sudden intolerable light as the men of the Golden City reached swiftly for peculiar weapons beside them. The light came from the crudely mounted weapon of the Ragged Men, and it was an unbearable actinic glare. For half a second, perhaps, it persisted, and died away to a red flame which leaped upward and was not.

Then the vehicle from the Golden City was a smoking, twisted ruin. Four of the six men in it were blasted, blackened crisps. Another staggered to his feet, struggled to reach a weapon and could not lift it, and twitched a dagger from his belt and fell forward; and Tommy could see that his suicide was deliberate.

The last man, alone, was comparatively unharmed by the blast of light. He swept a pistol-like contrivance into sight. It bore swiftly upon the now surging, yelling horde of Ragged Men. And one—two—three of them seemed to scream convulsively before they were trampled under by the rest.

But suddenly there were a myriad little specks of red all over the body of the man at bay. The pistol-like thing dropped from his grasp as his whole hand became encrimsoned. And then he was buried beneath the hating, blood-lusting mob of the forest men.

Chapter 5

An hour later, Tommy took his eyes away from the dimensoscope eye-piece. He could not bear to look any longer.

“Why don’t they kill him?” he demanded sickly, filled with a horrible, a monstrous rage. “Oh, why don’t they kill him?”

He felt maddeningly impotent. In another world entirely, a mob of half-naked renegades had made a prisoner. He was not dead, that solely surviving man from the Golden City. He was bound, and the Ragged Men guarded him closely, and his guards were diverting themselves unspeakably by small tortures, minor tortures, horribly painful but not weakening. And they capered and howled with glee when the bound man writhed.

The prisoner was a brave man, though. Helpless as he was, he presently flung back his head and set his teeth. Sweat stood out in great droplets upon his body and upon his forehead. And he stilled his writhings,

and looked at his captors with a grim and desperate defiance.

The guards made gestures which were all too clear, all too luridly descriptive of the manner of death which awaited him. And the man of the Golden City was ashen and hopeless and utterly despairing—and yet defiant.

Smithers took Tommy's place at the eye-piece of the instrument. His nostrils quivered at what he saw. The vehicle from the Golden City was being plundered, of course. Weapons from the dead men were being squabbled over, even fought over. And the Ragged Men fought as madly among themselves as if in combat with their enemies. The big golden weapon on its cart was already being dragged away to its former hiding-place. And somehow, it was clear that those who dragged it away expected and demanded that the solitary prisoner not be killed until their return.

It was that prisoner, in the agony which was only the beginning of his death, who made Smithers' teeth set tightly.

“I don’t see the Professor or Miss Evelyn,” said Smithers in a vast calmness. “I hope to Gawd they—don’t see this.”

Tommy swung on his heel, staring and ashen.

“They were near,” he said stridently. “I saw them! They saw what happened in the ambush! They’ll—they’ll see that man tortured!”

Smithers’ hand closed and unclosed.

“Maybe the Professor’ll have sense enough to take Miss Evelyn—uh—where she—can’t hear,” he said slowly, his voice level. “I hope so.”

Tommy flung out his hands desperately.

“I want to help that man!” he cried savagely. “I want to do something! I saw what they promised to do to him. I want to—to kill him, even! It would be mercy!”

Smithers said, with a queer, stilly shock in his voice:

“I see the Professor now. He’s got that gun-thing in his hand.... Miss Evelyn’s urging him to try to do something.... He’s looking at the sky.... It’ll be a long time before it’s dark.... He’s gone back out of sight....”

“If we had some dynamite!” said Tommy desperately, “we could take a chance on blowing ourselves to bits and try to fling it through and into the middle of those devils....”

He was pacing up and down the laboratory, harrowed by the fate of that gray-faced man who awaited death by torture; filled with a wild terror that Evelyn and her father would try to rescue him and be caught to share his fate; racked by his utter impotence to do more than watch....

Then Smithers said thickly:

“God!”

He stumbled away from the eye-piece. Tommy took his place, dry-throated with terror. He saw the

Ragged Men laughing uproariously. The bearded man who was their leader was breaking the arms and legs of the prisoner so that he would be helpless when released from the stake to which he was bound. And if ever human beings looked like devils out of hell, it was at that moment. The method of breaking the bones was excruciating. The prisoner screamed. The Ragged Men rolled upon the ground in their maniacal mirth.

And then a man dropped, heaving convulsively, and then another, and still another.... The grim, gaunt figure of Denham came out of the tree-fern forest, the queer small golden-metal trunchion in his hand. A fourth man dropped before the Ragged Men quite realized what had happened. The fourth man himself was armed—and a flashing slender body came plunging from the forest and Evelyn flung herself upon the still-heaving body and plucked away that weapon.

Tommy groaned, in the laboratory in another world. He could not look away, and yet it seemed that the heart would be torn from his body by that sight.

Because the Ragged Men had turned upon Denham with a concentrated ferocity, somehow knowing instantly that he was more nearly akin to the men of the Golden City than to them. But at sight of Evelyn, her garments rent by the thorns of the forest, her white body gleaming through the largest tears, they seemed to go mad. And Tommy's eyes, glazing, saw the look on Denham's face as he realized that Evelyn had not fled, but had followed him in his desperate and wholly hopeless effort.

Then the swarming mass of Ragged Men surged over the two of them. Buried them under reaching, hating, lusty fiends who fought even among themselves to be first to seize them.

Then there was only madness, and Denham was bound beside the man of the Golden City, and Evelyn was the center of a fighting group which was suddenly flung aside by the bearded giant, and the encampment of the Ragged Men was bedlam. And somehow Tommy knew with a terrible clarity that a man of the Golden City to torture was bliss unimaginable to these half-mad enemies of that city.

But a woman—

He turned from the instrument, three-quarters out of his head. He literally did not see Von Holtz gazing furtively in the doorway. His eyes were fixed and staring. It seemed that his brain would burst.

Then he heard his own voice saying with an altogether unbelievable steadiness:

“Smithers! They’ve got Evelyn. Get the sub-machine gun.”

Smithers cried out hoarsely. His face was not quite human, for an instant. But Tommy was bringing the work bench on which he had installed his magnetic catapult, close over by the dimensoscope.

“This cannot work,” he said in the same incredible calmness. “Not possibly. It should not work. It will not work. But it has to work!”

He was clamping the catapult to a piece of heavy timber.

“Put the gun so it shoots into the first magnet,” he said steadily. “The magnet-windings shouldn’t stand the current we’ve got to put into them. They’ve got to.”

Smithers’ fingers were trembling and unsteady. Tommy helped him, not looking through the dimensoscope at all.

“Start the dynamo,” he said evenly—and marveled foolishly at the voice that did not seem to belong to him at all, talking so steadily and so quietly. “Give me all the juice you’ve got. We’ll cut out this rheostat.”

He was tightening a vise which would hold the deadly little weapon in place while Smithers got the crude-oil engine going and accelerated it recklessly to its highest speed. Tommy flung the switch. Rubber insulation steamed and stank. He pulled the trigger of the little gun for a single shot. The bullet flew into the first hollow magnet, just as he had beforehand thrust an iron wire. It vanished. The series of magnets seemed unharmed.

With a peculiar, dreamlike steadiness, Tommy put his hand where an undeflected bullet would go through it. He pressed the trigger again. He felt a tiny breeze upon his hand. But the bullet had been unable to elude the compound-wound magnets, each of which now had quite four times the designed voltage impressed upon its coils.

Tommy flung off the switch.

“Work the gun,” he ordered harshly. “When I say fire, send a burst of shots through it. Keep the switch off except when you’re actually firing, so—God willing—the coils don’t burn out. Fire!”

He was gazing through the dimensoscope. Evelyn was struggling helplessly while two Ragged Men held her arms, grinning as only devils could have grinned, and others squabbled and watched with a fascinated attention some cryptic process which could only be the drawing of lots....

Tommy saw, and paid no attention. The machine-gun beside him rasped suddenly. He saw a tree-fern frond

shudder. He saw a gaping, irregular hole where a fresh frond was uncurling. Tommy put out his hand to the gun.

“Let me move it, bench and all,” he said steadily.

“Now try it again. Just a burst.”

Again the gun rasped. And the earth was kicked up suddenly where the bullets struck in that other world. The little steel-jacketed missiles were deflected by the terribly overstrained magnets of the catapult, but their energy was not destroyed. It was merely altered in direction. Fired within the laboratory upon our own and normal world, the bullets came out into the world of tree-ferns and monstrous things. They came out, as it happened, sideways instead of point first, which was due to some queer effect of dimension change upon an object moving at high velocity. Because of that, they ricocheted much more readily, and where they struck they made a much more ghastly wound. But the first two bursts caused no effect at all. They were not even noticed by the Ragged Men. The noise of the little gun was thunderous and snarling in the laboratory, but in the world of the fifth dimension

there was no sound at all.

“Like this,” said Tommy steadily. “Just like this.... Now fire!”

He had tilted the muzzle upward. And then with a horrible grim intensity he traversed the gun as it roared.

And it was butchery. Three Ragged Men were cut literally to bits before the storm of bullets began to do real damage. The squabbling group, casting lots for Evelyn, had a swathe of dead men in its midst before snarls begun had been completed.

“Again,” said Tommy coldly. “Again, Smithers, again!”

And again the little gun roared. The burly bearded man clutched at his throat—and it was a gory horror. A Thing began to run insanely. It did not even look human any longer. It stumbled over the leader of the Ragged Men and died as he had done. The bullets came tumbling over themselves erratically. They swooped and curved and dispersed themselves

crazily. Spinning as they were, at right angles to their line of flight, their trajectories were incalculable and their impacts were grisly.

The little gun fired ten several bursts, aimed in a desperate cold-bloodedness, before the smell of burnt rubber became suddenly overpowering and the rasping sound of an electric arc broke through the rumbling of the crude-oil engine in the back.

Smithers sobbed.

“Burnt out!”

But Tommy waved his hand.

“I think,” he said savagely, “that maybe a dozen of them got away. Evelyn’s staggering toward her father. She’ll turn him loose. That prisoner’s dead, though. Didn’t mean to shoot him, but those bullets flew wild.”

He gave Smithers the eye-piece. Sweat was rolling down his forehead in great drops. His hands were

trembling uncontrollably.

He paced shakenly up and down the laboratory, trying to shut out of his own sight the things he had seen when the bullets of his own aiming literally splashed into the living flesh of men. He had seen Ragged Men disemboweled by those spinning, knifelike projectiles. He had turned a part of the mad world of that other dimension into a shambles, and he did not regret it because he had saved Evelyn, but he wanted to shut out the horror of seeing what he had done.

“But now,” he said uncertainly to himself, “they’re no better off, except they’ve got weapons.... If that man from the Golden City hadn’t been killed....”

He was looking at the magnetic catapult, burned out and useless. His eyes swung suddenly to the other one. Just a little while since he had made ready a missile to be thrown through into the other world by that. It contained snapshots, and diagrams, and it was an attempt to communicate with the men of the Golden City without any knowledge of their language.

“But—I can communicate with Denham!”

He began to write feverishly. If he had looked out of the laboratory window, he would have seen Von Holtz running like a deer, waving his arms jerkily, and—when out of earshot of the laboratory—shouting loudly. And Von Holtz was carrying a small black box which Tommy would have identified instantly as a motion picture camera, built for amateurs but capable of taking pictures indoors and with a surprisingly small amount of light. And if Tommy had listened, he might possibly have heard the beginnings of those shoutings to men hidden in a patch of woodland about a quarter of a mile away. The men, of course, were Jacaro’s, waiting until either Von Holtz had secured the information that was wanted, or until an assault in force upon the laboratory would net them a catapult ready for use—to be examined, photographed, and duplicated at leisure.

But Tommy neither looked nor listened. He wrote feverishly, saying to Smithers at the dimensoscope:

“Denham’ll be looking around to see what killed those

men. When he does, we want to be ready to shoot a smoke-bomb through to him, with a message attached.”

Smithers made a gesture of no especial meaning save that he had heard. And Tommy went on writing swiftly, saying who he was and what he had done, and that another globe was being built so that he and Smithers could come with supplies and arms to help....

“He’s lookin’ around now, Mr. Reames,” said Smithers quietly. “He’s picked up a ricocheted bullet an’ is staring at it.”

The crude-oil engine was running at a thunderous rate. Tommy fastened his note in the little missile he had made ready. He placed it under the solenoid of the catapult after Denham’s design, with the springs and rings of metallic ammonium. He turned to Smithers.

“I’ll watch for him,” said Tommy unsteadily. “You know, watch for the right moment to fling it through.

Slow up the generator a little. It'll rack itself to pieces."

He put his eye to the eye-piece. He winced as he saw again what the bullets of his aiming had done. But he saw Denham almost at once. And Denham was scratched and bruised and looked very far indeed from the ideal of a professor of theoretic physics, with hardly more than a few shreds of clothing left upon him, and a ten-day's beard upon his face. He limped as he walked. But he had stopped in the task of gathering up weapons to show Evelyn excitedly what it was that he had found. A spent and battered bullet, but indubitably a bullet from the world of his own ken. He began to stare about him, hopeful yet incredulous.

Tommy took his eye from the dimensoscope just long enough to light the fuse of the smoke-bomb.

"Here it goes, Smithers!"

He flung the switch. The missile with its thickly smoking fuse leaped upward as the concentric rings

flickered and whirled bewilderingly. The missile hurt the eyes that watched it. It vanished. The solenoid dropped to the floor from the broken small contrivance.

Then Tommy's heart stood still as he gazed through the eye-piece again. He could see nothing but an opaque milkiness. But it drifted away, and he realised that it was smoke. More, Denham was staring at it. More yet, he was moving cautiously towards its source, one of the strange golden weapons held ready....

Denham was investigating.

The generator at the back of the laboratory slowed down. Smithers was obeying orders. Tommy hung close by the vision instrument, his hands moving vaguely and helplessly, as one makes gestures without volition when anxious for someone else to duplicate the movements for which he sets the example.

He saw Denham, very near, inspecting the smoking thing on the ground suspiciously. The smoke-fuse ceased to burn. Denham stared. After an age-long delay, he picked up the missile Tommy had prepared. And Tommy saw that there was a cord attached to it. He had fastened that cord when planning to try to communicate with the men of the Golden City, when he had expected them to be victorious.

But he saw Denham's face light up with pathetic hope. He called to Evelyn. He hobbled excitedly to her, babbling....

Tommy watched, and his heart pounded suddenly as Evelyn turned and smiled in the direction in which she knew the dimensoscope must be. A huge butterfly, its wings a full yard across, fluttered past her head. Denham talked excitedly to her. A clumsy batlike thing swooped by overhead. Its shadow blanketed her face for an instant. A running animal, small and long, ran swiftly in full view from one side of the dimensoscope's field of vision to the other. Then a snake, curiously horned, went writhing past....

Denham talked excitedly. He turned and made gestures as of writing, toward the spot where he had picked up Tommy's message. He began to search for a charred stick where the Ragged Men had built a fire some days now past. A fleeing furry thing sped across his feet, running....

Denham looked up. And Evelyn was staring now. She was staring in the direction of the Golden City. And now what was almost a wave of animals, all wild and all fleeing, swept across the field of vision of the dimensoscope. There were gazelles, it seemed—slender-limbed, graceful animals, at any rate—and there were tiny hooved things which might have been eohippi, and then a monstrous armadillo clanked and rattled past....

Tommy swung the dimensoscope. He gasped. All the animal world was in flight. The insects had taken to wing. Flying creatures were soaring upward and streaking through the clear blue sky, and all in the one direction. And then out of the morass came monstrous shapes; misshapen, unbelievable reptilian shapes, which fled bellowing thunderously for the

tree-fern forest. They were gigantic, those things from the morass. They were hideous. They were things out of nightmares, made into flabby flesh. There were lizards and what might have been gigantic frogs, save that frogs possess no tails. And there were long and snaky necks terminating in infinitesimal heads, and vast palpitating bodies following those impossible small brain-cases, and long tapering tails that thrashed mightily as the ghastly things fled bellowing....

And the cause of the mad panic was a slowly moving white curtain of mist. It was flowing over the marsh, moving with apparent deliberation, but, as Tommy saw, actually very swiftly. It shimmered and quivered and moved onward steadily. Its upper surface gleamed with elusive prismatic colors. It had blotted out the horizon and the Golden City, and it came onward....

Denham made frantic, despairing gestures toward the dimensoscope. The thing was coming too fast. There was no time to write. Denham held high the cord that trailed from the message-bearing missile. He

gesticulated frantically, and raced to the gutted steel globe and heaved mightily upon it and swung it about so that Tommy saw a great steel ring set in its side, which had been hidden before. He made more gestures, urgently, and motioned Evelyn inside.

Tommy struck at his forehead.

“It’s poison gas,” he muttered. “Revenge for the smashed-up vehicle.... They knew it by an automatic radio signal, maybe. This is their way of wiping out the Ragged Men.... Poison gas.... It’ll kill Denham and Evelyn.... He wants me to do something....”

He drew back, staring, straining every nerve to think.... And somehow his eyes were drawn to the back of the laboratory and he saw Smithers teetering on his feet, with his hands clasped queerly to his body, and a strange man standing in the door of the laboratory with an automatic pistol in his hand. The automatic had a silencer on it, and its clicking had been drowned out, anyhow, by the roaring of the crude-oil engine.

The man was small and dark and natty. His lips were drawn back in a peculiar mirthless grin as Smithers teetered stupidly back and forth and then fell....

The explosion of Tommy's own revolver astounded him as much as it did Jacaro's gunman. He did not ever remember drawing it or aiming. The natty little gunman was blotted out by a spouting mass of white smoke—and suddenly Tommy knew what it was that Denham wanted him to do.

There was rope in a loose and untidy coil beneath a work bench. Tommy sprang to it in a queer, nightmarish activity. He knew what was happening, of course. Von Holtz had seen the magnetic catapult at work. That couldn't be destroyed or its workings hidden like the ring catapult of Denham's design. He'd gone out to call in Jacaro's men. And they'd shot down Smithers as a cold-blooded preliminary to the seizure of the instrument Jacaro wanted.

It was necessary to defend the laboratory. But Tommy could not spare the time. That white mist was moving upon Evelyn and her father, in that other world. It

was death, as the terror of the wild things demonstrated. They had to be helped....

He knotted the rope to the end of the cord that vanished curiously somewhere among the useless mass of rings. He tugged at the cord—and it was tugged in return. Denham, in another world, had felt his signal and had replied to it....

A window smashed suddenly and a bullet missed Tommy's neck by inches. He fired at that window, and absorbedly guided the knot of the rope past its vanishing point. The knot ceased to exist and the rope crept onward—and suddenly moved more and more swiftly to a place where abruptly it was not. For the length of half an inch, the rope hurt the eyes that looked at it. Beyond that it was not possible to see it at all.

Tommy leaped up. He plunged ahead of two separate spurts of shots from two separate windows. The shots pierced the place where he had been. He was racing for the crude-oil engine. There was a chain wound upon a drum, there, and a clutch attached the drum

to the engine.

He stopped and seized the repeating shotgun Smithers had brought as his own weapon against Jacaro's gangsters. He sent four loads of buckshot at the windows of the laboratory. A man yelled.

And Tommy had dropped the gun to knot the rope to the chain, desperately, fiercely, in a terrible haste.

The chain began to pay out to that peculiar vanishing point which was here an entry-way to another world—perhaps another universe.

A bullet nicked his ribs. He picked up the gun and fired it nearly at random. He saw Smithers moving feebly, and Tommy had a vast compassion for Smithers, but— He shuddered suddenly. Something had struck him a heavy blow in the shoulder. And something else battered at his leg. There was no sound that could be heard above the thunder of the crude-oil motor, but Tommy, was queerly aware of buzzing things flying about him, and of something very warm flowing down his body and down his leg.

And he felt very dizzy and weak and extremely tired.... He could not see clearly, either.

But he had to wait until Denham had the chain fast to the globe. That was the way he had intended to come back, of course. The ring was in the globe, and this chain was in the laboratory to haul the globe back from wherever it had been sent. And Von Holtz had disconnected it before sending away the globe with Denham in it. If the chain remained unbroken, of course it could be hauled in, as it would turn all necessary angles and force the globe to follow those angles, whatever they might be....

Tommy was on his hands and knees, and men were saying savagely:

“Where’s that thing, hey? Where’s th’ thing Jacaro wants?”

He wanted to tell them that they should say if the chain had stopped moving to a place where it ceased to exist, so that he could throw a clutch and bring Denham and his daughter back from the place where

Von Holtz had marooned them when he wanted to steal Denham's secret. Tommy wanted to explain that. But the floor struck him in the face, and something said to him:

"They've shot you."

But it did not seem to matter, somehow, and he lay very still until he felt himself strangling, and he was breathing in strong ammonia which made his eyes smart and his tired lungs gasp.

Then he saw flames, and heard a motor car roaring away from close by the laboratory.

"They've stolen the catapult and set fire to the place," he remembered dizzily, "and now they're skipping out...."

Even that did not seem to matter. But then he heard the chain clank, next to him on the floor. The white mist! Denham and Evelyn waiting for the white mist to reach them, and Denham jerking desperately on the chain to signal that he was ready....

The flames had released ammonia from the metal Von Holtz had made. That had roused Tommy. But it did not give him strength. It is impossible to say where Tommy's strength came from, when somehow he crawled to the clutch lever, with the engine roaring steadily above him, and got one hand on the lever, and edged himself up, and up, and up, until he could swing his whole weight on that lever. That instant of dangling hurt excruciatingly, too, and Tommy saw only that the drum began to revolve swiftly, winding the chain upon it, before his grip gave way.

And the chain came winding in and in from nowhere, and the tall laboratory filled more and more thickly with smoke, and lurid flames appeared somewhere, and a rushing sound began to be audible as the fire roared upward to the inflammable roof, and the engine ran thunderously....

Then, suddenly, there was a shape in the middle of the laboratory floor. A huge globular shape which it hurt the eyes to look upon. It became visible out of nowhere as if evoked by magic amid the flames of hell. But it came, and was solid and substantial, and it

slid along the floor upon small wheels until it wound up with a crash against the winding drum, and the chain shrieked as it tightened unbearably—and the engine choked and died.

Then a door opened in the monstrous globe. Two figures leaped out, aghast. Two ragged, tattered, strangely-armed figures, who cried out to each other and started for the door. But the girl stumbled over Tommy and called, choking, to her father. Groping toward her, he found Smithers. And then Tommy smiled drowsily to himself as soft arms tugged bravely at him, and a slender, glorious figure staggered with him to fresh air.

“It’s Von Holtz,” snapped Denham, and coughed as he fought his way to the open. “I’ll blast him to hell with these things we brought back....”

That was the last thing Tommy knew until he woke up in bed with a feeling of many bandages and an impression that his lungs hurt.

Denham seemed to have heard him move. He looked

in the door.

“Hullo, Reames. You’re all right now.”

Tommy regarded him curiously until he realized. Denham was shaved and fully clothed. That was the strangeness about him. Tommy had been watching him for many days as his clothing swiftly deteriorated and his beard grew.

“You are, too, I see,” he said weakly. “I’m damned glad.” Then he felt foolish, and querulous, and as if he should make some apology, and instead said, “But five dimensions does seem extreme. Three is enough for ordinary use, and four is luxurious. Five seems to be going a bit too far.”

Denham blinked, and then grinned suddenly. Tommy had admired the man who could face so extraordinary a situation with such dogged courage, and now he found, suddenly, that he liked Denham.

“Not too far,” said Denham grimly. “Look!” He held up one of the weapons Tommy had seen in that other

world, one of the golden-colored truncheons. “I brought this back. The same metal they built that wagon of theirs with. All their weapons. Most of their tools—as I know. It’s gold, man! They use gold in that world as we use steel here. That’s why Jacaro was ready to kill to get the secret of getting there. Von Holtz enlisted him.”

“How did you know—” began Tommy weakly.

“Smithers,” said Denham. “We dragged both of you out before the lab went-up in smoke. He’s going to be all right, too. Evelyn’s nursing both of you. She wants to talk to you, but I want to say this first: You did a damned fine thing, Reames! The only man who could have saved us, and you just about killed yourself doing it. Smithers saw you swing that clutch lever with three bullets in your body. And you’re a scientist, too. You’re my partner, Reames, in what we do in the fifth dimension.”

Tommy blinked. “But five dimensions does seem extreme....”

“We are the Interdimensional Trading Company,” said Denham, smiling. “Somehow, I think we’ll find something in this world we can trade for the gold in that. And we’ve got to get there, Reames, because Jacaro will surely try to make use of that catapult principle you worked out. He’ll raise the devil; and I think the people of that Golden City would be worth knowing. No, we’re partners. Sooner or later, you’ll know how I feel about what you’ve done. I’m going to bring Evelyn in here now.”

He vanished. An instant later Tommy heard a voice—a girl’s voice. His heart began to pound. Denham came back into the room and with him was Evelyn. She smiled warmly upon Tommy, though as his eyes fell blankly upon the smart sport clothes she was again wearing, she flushed.

“My daughter Evelyn,” said Denham. “She wants to thank you.”

And Tommy felt a warm soft hand pressing his, and he looked deep into the eyes of the girl he had never before spoken to, but for whom he had risked his life,

and whom he knew he would love forever. There were a thousand things crowding to his lips for utterance. He had watched Evelyn, and he loved her—

“H-how do you do?” said Tommy, lamely. “I’m—awfully glad to meet you.”

But before he was well he learned to talk more sensibly.

February 1931

69 Werewolves of War, by Desmond Winter Hall

The story of the "Torpedo Plan" and of Capt. Lance's heroic part in America's last mighty battle with the United Slavs.

Aproximate word count:

Bigotry:

Warnings: taking with him the cord

- - -

Under the mesh of his gas-mask the lean lines of his jaw went taut. Tense, steely fingers flipped to the knobbed control instruments; the gleaming single-seater scout plane catapulted in a screaming somersault. Lance's ever-wary sixth sense told him the tongues of disintegrating flame had licked the plane's protected belly, and for the fact that it was protected he thanked again his stupendous luck. He pulled savagely at the squat control stick; the four Rahl-Diesels unleashed a torrent of power; and the slim scout rose like a comet, and hurtled, the altitude dial's nervous finger proclaimed, to ten thousand feet. Lance eased off the power, relaxed slightly, and glanced below.

They'd started off a squadron of fifteen planes. Thirteen had crumpled beneath that treacherous, stabbing curtain of disintegrating flame. Only two of them were left—he and Praed.

Praed, of course!

The fellow's plane was pirouetting nearby. Lance was the squadron leader. He jammed his thin-lipped mouth close to the "mike" and rasped:

"They trapped us again! There's some damn spy at our base. Stand by, Praed! They'll send up a few men to wipe us out, too ... and we're goin' to square the account!"

He listened for Praed's answer. Presently it came.

"I can't! They got two of my motors. I'm limping badly. We'd better beat it while we can."

Lance's mouth curled. He roared:

"Go on, then, beat it! But I'm goin' to take a couple of 'em, anyway." Disgusted, filled with red anger, he flung the phones from his head, watched Praed's plane whirl its stubby nose for home, settled himself alertly in the low, padded seat and concentrated his attention on the ground below.

He'd been right. Tiny, gray-clad figures were pouring

from their barracks, rushing madly towards the dozen or so planes neatly drawn up on the field. Lance's mouth twitched. They probably wondered, down there, why the devil he didn't beat it—like Praed! He stroked the lever which controlled his five gas bombs, centered his battery of incendiary-bullet machine-guns and ruthlessly shoved the control stick full over.

The Rahl-Diesels pumped at full power; his plane plummeted downwards with the speed of light, a hurtling shell of steel. His unexpected move took the men below by surprise. Lance knew they needed at least ten minutes to prepare another salvo of disintegrating flame; he had about four minutes left.

There was a restless, thudding chatter, and his bullets began to mow them down.

Lance could see the horrified expressions of the men beneath, and chuckled grimly as they sought to escape the wrath of his hot guns. He flung bursts of spouting, acid-filled lead at the defenseless planes, and saw two of them collapse in shrouds of acrid white smoke. And still he dove.

At a bare one hundred feet he tugged the control stick back, and the tiny scout groaned under the pull of her motors. Then her snout jolted upwards. Lance pounded the gas bomb lever, and smiled a tight smile as he sensed the five pills sloping down from their compartment in the scout's belly.

A second later came a rolling, ear-numbing crash. Lance, safe at a perch of a few thousand feet, grinned as his narrowed eyes beheld the sticky curtain of death-crammed gas hug over the enemy base.

"That'll quiet 'em for a few minutes!" he muttered savagely.

A few minutes—but not more. And he had no more bombs; his ammunition belts were nearly depleted. "I guess," he murmured, "I'd better follow that quitter, Praed. I've paid 'em for the boys they got, anyway!"

He levelled the plane out, threw a last glance at the carpet of gas he had laid, and spurred the purring Rahl-Diesels to their limit. His speed dial flashed round to five hundred, five-fifty—seventy—and finally

rested, quivering, at the scout's full six hundred miles per hour.

Under the streamlined plane's speeding body the gnarled, bomb-torn terrain of Nevada hurtled by. A rather sad frown creased Lance's prematurely old brow as he glimpsed it. Thousands of lives had been thrown into that ground; the hot, tumbled waste was doused with freely-sacrificed blood, the blood of whole regiments of America's heroic First Home Army. Martyred men! Lance couldn't help swearing to himself at the bitter thought of that terrible reckoning day. It was the price his country had paid for her continued ignoring of the festering peril overseas. Slaughtered like sheep, those glorious regiments had been! Helpless, almost, before the ultra-modern war weapons of the United Slav hordes, they'd stopped the numbingly quick advance merely by the weight of their bodies. Like little Belgium, in 1914. They'd held the Slavs to California, ravished, war-desolated California.

The thin front-line trenches far behind, Lance began a slanting dive that raised his speed well over six

hundred. Through the front magnifying mirror he spied the squat khaki buildings of his base.

Werewolves of War, the batch of planes he belonged to had been christened, and it was a richly deserved title. In front of the front they fought, detailed to desperate, harrying missions, losing an average of ten men a day. The ordeal of gas and fire and acid bullets added five years to a man's brow overnight—if he served with the Werewolves of War.

Lance was only twenty-four, but his hair was splotched with dead gray strands; his eyes were hard and weary; his face lined with new wrinkles. Ah, well, it was war—and a losing war, he had to admit, that they fought. If a miracle didn't come, America would crumble even as old Europe had, before the overwhelming Slavish troops.

Even now, as Lance knew through various rumors, the Slavs were massed for a grand attack. And with what could America hold them back?

His helicopter props spun, and the scout nestled down lightly on the tarmac. Lance switched off the

faithful Rahl-Diesels, swung open the tiny door and leaped from the enclosed cockpit.

"Sir," he rapped to thin, stern-browed Colonel Douglas, "there's no longer any doubt in my mind. This is the fifth time we've been anticipated—trapped! The enemy is informed directly of the attacking plans of our scout details. There's a spy at this base!" He lowered his eyes for a second and said in a queer tone of voice: "Thirteen of 'em went down to-day."

Colonel Douglas' tired face showed the never-ceasing strain he was under. He clasped hands behind his back, took a few nervous turns up and down the small office and finally, with a somewhat hopeless sigh, muttered:

"I know, Lance, I know. The devils! They seem to be aware of everything we plan. Yet what can we do? Look at the territory our front lines cover! More than two thousand miles of loosely held ground. And we're so damnably organized, man! Look here!"

He strode to the huge map which covered entirely

one wall of the little room and ran his forefinger down the long red line, signifying the American front, which stretched crookedly from the Canadian border to the Gulf of California. Parallel to it was another line, of black—the United Slavs.

"It's so damned easy," Colonel Douglas said, "for a spy to slip over." He sighed again. "I fought in the scrap of 1917 as a kid of twenty; it was different then. But this is 1938, and it's a scientific war we're trying to fight." He sat down in his swivel chair. "How—how did they wipe you out to-day?"

"That blasted disintegrating flame again," Lance told him swiftly. "It's obvious, Colonel: how did the Slavs know we were going to raid that comparatively unimportant base of theirs at such and such a time? They had the flame shooters all ready for us—and at a place where they've never had them before! We came up at twenty-five thousand feet, dropped down in a full power dive, and"—he gestured widely—"biff! The flames caught us neatly at the regulation thousand feet. They got thirteen men. Only two got away, Praed and myself." His keen eyes were inquiring, and the

colonel interpreted their look correctly.

"Praed," he murmured. "Yes, I saw him come back, by himself. He said you were following. Two of his motors were shot. He seems to bear a charmed life, doesn't he?"

Lance nodded. He didn't like to hint at the thought he had in mind. It seemed a cowardly, stab-in-the-back thing to do. Yet it was duty, and there was no questioning duty.

"I've never seen Praed shoot down an enemy plane," he said slowly. "This is the fifth time we've been ambushed—and Praed's never been caught. Somehow, he's always seemed to be aware of what was coming."

"You mean—?" the colonel questioned.

Lance shook his head. "I don't want to commit myself, Colonel Douglas, but—I'm suggesting that we—well—keep our eyes peeled, and perhaps watch certain members of the outfit more closely."

Douglas rose as his orderly, Ranth, came into the room. "Find Lieutenant Praed for me," the colonel ordered crisply. Then, turning to Lance, he said: "You'd better knock off a few hours' sleep. You are worn out."

Lance watched the orderly, Ranth, salute and leave. Ranth was heavy, thick-built, with closely set eyes. The young squadron leader was suddenly conscious that he was, as the colonel said, worn out; his limbs seemed leaden, his eyelids heavy. "I think you're right, sir," he murmured, and walked out onto the field.

Seeing Praed's machine drawn up with the overall-clad figure of a mechanic fussing at its motors, he wandered over to survey it. The scout was an exact replica of his, a model of the famous Goshawk type. It was all motor—everything being sacrificed to speed. On either side of the stubby brow of the fuselage, which held the death-dealing battery of three machine-guns, were set the four Rahl-Diesel motors, back to back. The pilot's tiny enclosed cockpit was thus surrounded by engines. In the V-shaped, smooth-

lined wings were the two helicopter props; further back, inside the steel-sheathed, bullet-like fuselage, the radio outfit and fuel tanks. The craft's rounded belly covered the gas bomb compartment.

The mechanic was a little cockney Englishman, a fugitive, like all his countrymen, from the horror which had stricken England suddenly and left her wallowing in her life blood. He looked up at Lance, and a smile broke forth on his wizened, sharp little face.

"It's got me beat, sir," he said in his curious, twanging voice. "Lieutenant Praed, 'e sez to me, 'Somethin' wrong with two of me motors,' 'e sez. 'They quit on me quite sudden like. Look 'em over, will you?' 'e sez. So I been lookin' 'em over. But they ain't nothin' wrong with the bloody things, sir—nothin' at all!"

"It does seem funny, doesn't it, Wells?" Lance said levelly. He'd known it all along. Praed was a quitter—a yellow-belly—besides being—But he stopped there. He had no definite proof. It was unjust to accuse a man of *that* without definite, positive proof.

The little mechanic muttered some mysterious cockney curse, and then said, in an admiring tone:

"'Ow many of the swines' planes 'ave you shot down now, sir?"

"About twenty, I think," Lance told him gruffly. The cockney shot his breath out with a whistle.

"Cripes! You'll be up to that there Captain Hay soon if you keeps it up, sir!"

Lance laughed. Hay, the almost legendary hero of the American Air Force—who had shot down, so latest rumors said, fifty Slav planes—was far above him. "I'll never reach Hay's record, Wells. I'll be doing pretty well if I bag half as many!" Then, seeing Ranth, the orderly, followed by Praed, he strode quickly away and came face to face with the latter.

For a moment the two men eyed each other, a taut silence between them. Praed's thin, sun-blackened countenance was immovable, masklike. His blue-green eyes met Lance's steadily. Finally Lance

snorted and burst out:

"Why the hell did you run away, Praed? Scared stiff?"

Praed's low voice, devoid of all trace of emotion, asked: "What makes you think I was scared, Lance?"

"You know damn well what makes me think it! That lousy crack about your motors being shot!"

"Two of my motors were limping."

Lance gave a sarcastic chuckle. "Ask Wells about that, why don't you? He's got a few ideas on the subject."

Praed repeated: "Two of my motors were limping," and abruptly he turned away, leaving Lance fuming, and went into Colonel Douglas' office.

What would Douglas say to him? Accuse him outright of his suspicions? Put him under arrest as a spy? But he couldn't do that: there was, after all, no proof. Lance swore to himself; then, feeling a wave of weariness surge over him, went to the shack he was

quartered in, kicked off his battered boots, stripped away his Sam Browne, and flung his lean body out on the hard, gray-sheeted cot. Seconds later he was lost in the sleep that comes to the physically exhausted. The desperate situation America was in, the whole savage war—everything, faded from his mind.

But to right and left of that cot stretched others—empty. The brave squadron Lance had led into the blue sky that morning now lay charred skeletons around the flame-throwers that had struck them down.

And in a dozen other aircraft bases behind the hard pressed lines were other empty cots. Time and time again the Slav planes shot down two to the Americans' one; time and time again the treacherous disintegrating flames—the weapon which baffled America's scientists—had struck down whole squadrons that had been lured into traps, even as Lance's had been lured.

And even the Slav forces pushed forward....

Part 2

"You're wanted by Colonel Douglas, sir."

Lance felt a hand jarring his shoulder; he turned sleepily over, yawned, and stared up into the dark, full-cheeked face of Ranth, the orderly.

"Huh?"

"Colonel Douglas wants you," repeated Ranth. "It's five o'clock, sir."

Wearily Lance pulled on his boots and adjusted the military belt. The night was hot and sticky; somewhere, miles to the rear of the base, the batteries of long-distance guns were beginning their nightly serenade. Lance followed the orderly's broad, chunky back to the colonel's office.

The colonel gazed up with tired eyes from the welter of maps on his desk.

"Lance," he said, "I'm changing the routine of the

night patrol. A fresh batch of youngsters came in this afternoon to fill the empty files; two dozen new planes arrived by transport, too. I'm sending ten of them over for the night patrol; Stephens will take your place. I've got another errand for you—and Praed."

Lance was conscious that Ranth was standing quietly behind the colonel's chair. Douglas ordered him to attend to some errand and the orderly left.

"I had an interview with Praed," the colonel went on. "I didn't exactly accuse him of anything definite, but I think I threw a bit of a scare into him. To-night we'll give him the acid test.

"You and he will fly over to-night to investigate Hill 333. There have been rumors that the Slavs are massing there, and we want positive information. There's sure to be a fight. Watch Praed carefully. If he steers clear of any scrapping, well have enough to court-martial him on. Understand?"

Lance nodded.

"Right. It's a dangerous errand, Lance, but I'm confident you'll come through, as always. There's no one else who could handle the job. God, man, you're getting close to Hay's record! You'll be the top-notch of the service soon!"

The young man laughed briefly. "No danger of that. When do we take off, sir?"

Douglas consulted his watch. "Seven-fifteen. Come and get the dope from these maps. Hill 333's rather difficult to find."

"Anything been happening at the front, sir?"

The colonel passed both fine-fingered hands over his lined face. He said quietly: "Yes. The Slavs took twenty-five miles from us down in the lower sector. Just wiped our boys out. Those damnable flame-throwers and bullet-proof tanks, supported by God knows how many hundreds of planes. It's hell, Lance! Headquarters thinks they're going to unleash a general attack all along the line in the next few days. And our resources—well, our back's against the wall.

We're coming to death grips, man."

Seven-fifteen....

Lance pressed the starting button. His four motors choked, sputtered, then burst into a sweet, full-throated roar. He glanced over at Praed's plane, spun the small helicopter props over and pushed down the accelerator. The plane quivered, stuck its snout up and leaped like an arrow into the clean, darkening air. Lance gunned it to ten thousand feet, Praed following him neatly. Praed was a good pilot, no doubt about that. The two fighting machines hung for a second side by side; Lance eased off his helicopters and streaked away into the gloom at a breath-taking five hundred.

"I hope," muttered Colonel Douglas as the two tiny scouts sped from sight, "that everything goes smoothly. They're the men to do it, anyway. No better pilots in the whole service."

"Wot abaht that there Captain Hay, sir?" put in Wells, the mechanic, standing nearby. Colonel Douglas

smiled.

"Oh, of course!" he amended. "I'd forgotten Hay!"

Once more they were anticipated! Lance, at thirty thousand feet—the Rahl-Diesels, with their perfected superchargers, were easily capable of a ceiling of sixty—had hovered above the position of Hill 333, pulled on his gas-mask and said through the microphone to Praed:

"Power dive to three thousand feet. Release your flares and take in all you can before they send up planes. We'll take 'em by surprise, but there's bound to be a fight. Got it?"

The steady reply came back: "Okay."

Whereat Lance set his teeth in his customary fighting grin, jockeyed up his ammunition belts, glanced at the flare-parachutes folded alongside the cabin and plunged the scout in a dive that tipped six hundred and fifty miles and threatened to crack the speed dial.

But surprise? Nothing doing! Like angry hornets five Slav planes pounced on them at ten thousand feet. They'd been waiting there! Lance cursed savagely. He flung off his flares, Immelmanned up, and in less than two seconds had sent one Slav shrieking to the ground in flames. For the moment forgetting Praed, Lance followed after his flares, three Slavs attempting to sight their guns on the twisting, writhing, corkscrewing body of his Goshawk. He knew there were disintegrating flame-throwers below, but gambled on their not shooting because of the enemy scouts diving with him.

Flattening out at perhaps a thousand feet, Lance threw a rapid stare at the bulk of Hill 333. He drew his breath in sharply.

Lit dazzlingly by the bleaching white of the slow-floating flares, huge rows of the dreaded Slav tanks were clustered all around the hill!

As he looked, ten more Slav planes came soaring up from the ground. This was too hot! The thought of Praed stabbed through Lance's whirling brain; he

pulled the scout around, doubled over the three closing in on his tail, and belched lead for an instant at one he'd caught off guard. It collapsed like a punctured paper bag. Lance grinned and bounded to the upper regions. The two other Slavs let the crazy Yank go for the instant, joining forces with the ten brothers coming to help them out.

Lance, again at ten thousand, looked for Praed. Far above, he glimpsed two planes, circling and diving. Praed seemed to be fighting, at any rate! As he watched, the two scouts catapulted still higher; became tiny, almost imperceptible dots, visible only in the reflected light of the flares. Then Lance felt a shaft of ice along his spine.

The two planes had practically hugged each other for a second. Then one of them fell away, somersaulted, tumbled down wildly—out of control.

It passed Lance like a falling rock.

And it was Praed's scout!

"My God!" muttered Lance. "He's been shot down!"

The next moment the twelve Slavs were on him like a hurricane. Motors roaring, Lance stood them off—flinging a burst of lead here, dropping out of range here, looping, catapulting, zooming—fazing them with every trick he knew. A dozen times he sensed the zinging wrath of storms of bullets, a dozen times he escaped death by the breadth of a hair. Not for nothing was he called one of the best pilots in the service, second only to Hay.

He bagged another of the Slavs, and began to think of getting away. Praed had proved himself, but had been killed in doing so. He's got the dope on Hill 333. Now for the getaway.

As he whirled, another Slav plane—the one that had got Praed—dove down from above. And, in the last second of the ghostly light of the flares, Lance's bewildered eyes saw the face of the man inside it.

That face was Praed's!

Praed, inside an enemy scout! Praed firing at him!
Praed, not dead!

Lance was dumbfounded. He almost died, just then, for he felt his senses stagger, and relaxed his maneuvering. Praed! What—how—He couldn't begin to reckon it out.

If the flares hadn't died at that instant, Lance must have been shot down. Luckily, they expired; pitch darkness washed over everything. The lights on the Slav planes switched on, their prying beams fingering the sky for Lance's plane. But Lance was somewhat himself again. He jammed the accelerator down, dove headlong, flattened out and streaked for home. The speed of the Goshawk snatched him faithfully from the jaws of the Slavs. He left then milling behind. Left Praed with them!

Colonel Douglas was waiting for him. Lance's face must have been a study, for the elder man laughed shortly. "You need a drink!" he decided, and poured out a stiff tot of rum. Lance downed it with a nervous gulp and sprawled in a chair, the glass held weakly in

quivering fingers.

Dead silence brooded over the whole base. Even the muttering guns were still. One green-shaded light threw the maps on Douglas' desk into glaring prominence; besides that, there was no illumination anywhere in the 'drome. Lance knew he had a thumping headache and that his eyes were lumps of pain. The glass fell from his hand and crashed on the floor. It seemed to stir the young captain, for at last he looked up and met the colonel's inquiring gaze.

"Well?" The colonel was terse.

"I saw Praed shot down," Lance mumbled, as if to himself, "and then I saw him—"

"Wait!" Douglas strode rapidly to the door which led to the other rooms of the building. After glancing to right and left, with an explanatory "Walls sometimes have ears, you know!" he locked the door carefully again, came back, and said:

"Talk in a whisper! How about Hill 333?"

"Tanks massed there," Lance said slowly. "Yeh, I saw that, all right. They must be intending an attack on that sector. But—but—Praed—"

"What happened?"

Lance told him of the scrap, how Praed's plane had apparently rubbed wings with a Slav and then tumbled down, out of control. He concluded: "I figured that Praed was all right, that he'd proved himself, that he wasn't a spy, as we'd thought. *But the next moment I saw him in the Slav plane that had bagged his!*"

His wondering eyes sought the colonel's lean face. Lance expected to see it express amazement, incredulity. It didn't, though. He laughed!

While Lance gaped, the older man went to the delicate machinery of the radiophone in one corner of the trim office. He clasped the earphones over his head, and spoke into the mike: "Headquarters, Air Force, Washington, Douglas, Base 5, speaking."

A tense moment passed while his radio call was put through. Presently a green light flashed on the board. Douglas said swiftly: "Headquarters? Base 5, Colonel Douglas. Tanks massed around Hill 333; enemy evidently contemplates full attack on corresponding sector of our line. They know a scout of ours observed it, however; perhaps that will induce them to change their plans. This next is extremely important: *The first step of the Torpedo Plan has been successful!*"

For awhile he listened intently, replying with short-clipped affirmatives. Then he hung the headphones up and turned to the bewildered Lance. Colonel Douglas laughed again and rubbed his hands exultantly.

"What the hell—" Lance began. The other pulled out a drawer of his desk and took from it a small placard.

"Do you recognize the photo?" he asked smilingly.

Lance looked at it. It was the picture of a man in the uniform of a captain of the Air Force, a row of battle ribbons on his straight, khaki-clad chest. But it was the figure's face that Lance stared at.

"Sure," he said finally. "It's a picture of Praed. But what—"

"Not Praed," corrected the colonel. "Not Praed. Captain Basil Hay."

Part 3

"Good Lord!" Lance exclaimed without knowing he did so. Praed—Hay! The same man! Then that was the secret; that explained things! Hay, the hero of the force!

"You're entitled to a few explanations," Douglas said. "I'll give you the core of the whole scheme. There's no need to tell you that it must be guarded with your life." He drew his chair closer to Lance's.

"Yes, it's true. The man you knew as Praed in reality is Captain Hay. You see, Lance, headquarters was taking no chances with what I just called the Torpedo Plan. Every move had to be conducted with the utmost secrecy. Had to be! For the Torpedo Plan is, in some ways, America's last hope.

"Our base, No. 5, was chosen as the center of activity, the base from which the steps paving the way for the plan would be taken. The two best pilots in the service were needed. You and Hay were chosen.

"It was decided it would be best to mask Hay's real identity. So, officially, he was sent to the hospital; in reality he came here, under the name of Praed. Why? Because there's a spy somewhere—we don't seem to be able to track him; he's infernally clever—and if the famous Captain Hay was switched to Base 5, putting the two best pilots in the service together, that spy'd know something was in the air. Understand?"

Lance nodded dumbly. A great light was beginning to shower him.

"To more completely mask our true purpose," the colonel continued, "Hay was instructed to make it appear as if he were a spy. And it was a damned hard job! The real spy, whoever he is, and wherever he is, would thus be additionally fooled; for all he'd know, the Slavs might have sent another over to back him up. That's why Hay never shot down an enemy plane. Says something about his skill as a pilot, doesn't it? Never able to defend himself, save by maneuvering. He's a great flyer!"

Lance could only nod dumbly again.

"After a couple of weeks at this base," Douglas went on, "Hay was to cross the lines one night with you accompanying him. You, unintentionally, would thus occupy the enemy planes while Hay attended to the real business of the evening. And you did splendidly!"

"The real business?" Lance questioned. "What the devil was that? I thought the real business was to get the dope on Hill 333."

"So it was—partially. But also to take the first step of the Torpedo Plan, which was for Hay to switch over to a Slav plane."

"What?"

The colonel repeated his statement, somewhat dryly. Lance's square jaw dropped abruptly. "But—but—" he exclaimed, "how the devil could he do that?"

Colonel Douglas grinned.

"By a very neat contraption from the brain of one of our most valuable scientists," he explained. "Hay's

scout was specially fitted up before you left; while you were sleeping, in fact. Two experts from Washington arrived with that batch of new recruits this afternoon. A tiny sliding door was cut in the fuselage of the scout and a sort of folding ladder put inside. It was motivated by some rather complex spring-work; but the really ingenious thing about it was the powerful electro-magnet at its base.

"It's rather over my head," he smiled. "I'm a plain fighting man, and sometimes it seems that scientists and not fighting men are going to win this war.... But, at any rate, it worked like this:

"Hay lures, or maneuvers, a Slav plane away from its fellows, and while you're down below entertaining the others, flies wing to wing with it. He touches the spring of his ladder and it shoots out, powerfully magnetized, and clamps onto the steel fuselage of the Slav. The automatic control keeps Hay's scout steady, and the ladder is so highly attractive that the Slav simply can't get away. Hay crosses the gulf, taking with him the cord which controls the electro-magnet. He forces his way into the Slav, shoots down its pilot,

releases the pull of the magnet, and—there you are! Our best pilot in possession of a Slav plane, and clad in a Slav officer's uniform! Do you get the idea now?"

Lance strove for appropriate words. "Gee!" he spluttered. "It's—it's wonderful! And to think I tried to start a fight with Hay! I wish I'd known before. But I suppose," he added, "it was best to let not even me in on it, to keep it absolutely secret."

"Exactly!"

"And now what's Hay's mission?" Lance asked eagerly.

Colonel Douglas' face became sober. "A damnably dangerous one, and a mighty desperate one. As I said, the Torpedo Plan, which Hay is striving to carry out, seems to be America's last chance. We're holding the United Slavs, but only just. We simply can't break their line or make any headway against them; and when they do unleash their big push, there's nothing to stop them! So we're gambling everything on this slim hope.

"American science," he continued, "has perfected a weapon which is called the 'flying torpedo.' It's a ghastly thing, too. Damn it, I actually feel sorry for the poor devils it bursts on! It's a sort of riposte to their disintegrating flame.

"Picture a huge tanklike affair of steel, one hundred feet long. Picture a few dozen of them! Picture them crammed to overflowing with tons of glyco-scarzite, the most destructive explosive the mind of man has yet conceived. An explosive that can't be hurled in a shell and can't be dropped in a bomb from a plane. A pound or so of it, man, lays waste a square mile of anything! Even our scientists are a bit afraid of it. They've been trying to think up a way of unleashing it at the Slavs. And these flying torpedoes seem to be the answer.

"The torpedoes are purely mechanical. Therefore, they can soar to any height whatsoever. Twenty, thirty, even forty miles. All right. Now, picture a dozen or so of these torpedoes soaring over the most important Slav bases and headquarters, thirty miles above the earth, at night, of course, and absolutely

invisible to the most powerful search-rays. They fly without the slightest sounds. Get that? Well, when this squadron of awful death arrives at the exact point over the place to be demolished, the motive force switches off and down they crash. Imagine what will happen when they collide with the ground!" Douglas, with Lance's tense eyes on him, struck a clenched fist into an open palm.

"Tons of glyco-scarzite, Lance! Unleashed, without warning, from miles above! Thirty of these torpedoes, each a hundred feet long, dropping down on the very heart of the Slav invasion! Killing, blowing to bits, rather, every living thing, every fortification, every tree, every tank, every gun, every flame thrower, every plane in a radius of hundreds of miles!"

"God!" came from Lance's numb lips. "God!"

"*But*"—and the colonel held up a straight forefinger—"these torpedoes must be guided from the place they raid!"

Into the silence Lance whispered: "And that—that is

Hay's job?"

"That," Douglas confirmed levelly, "is Hay's job—and yours."

Their eyes met; held. And then Lance's clean young face smiled.

"Thank God, sir," he cried, "that I'm to help strike the blow that'll free our country!"

Colonel Douglas answered his smile with a smile.

"Lance," he said, "it's because Washington has put this job into Hay's and your hands that I know—*I know*—it will succeed."

"It will!"

Douglas lowered his voice again. "This is why those flying torpedoes must be guided from the Slav's innermost base.

"In the first place, they fly too high for an accompanying plane to guide them. In the second, the

power that releases them to hurtle downwards must come from the enemy base itself, to permit of no possible error. This must not fail!"

"But," put in Lance, "how do the torpedoes fly? What motivates them?"

"A closely guarded secret, of course," he was told. "I merely possess a slight comprehension of it. I know that it is an adaptation of that discovery of Professor Singe, two years ago—cosmic attraction. Eventually, perhaps, it will permit interplanetary travel. This use of it is simply the beginning. But it is to America's everlasting glory that a scientist of hers developed it.

"You know how a sliver of wood is propelled by the ripples of a pond? Vibrations of the water, really. Well, evidently there are somewhat similar vibrations in the ether, cosmic force. Each one of these flying torpedoes contains a highly expensive, intricate mechanism which transforms this invisible vibration-power into material propulsion. The mechanism is adjusted to propel the torpedo at such an altitude in such a direction. We possess no means of setting the

machines to *stop* at a certain place and so tumble earthwards. That's where you and Hay come in.

"Hay is now, with forged documents, passing himself off as a regular Slav pilot. He speaks the tongue. Two nights from now, you, Lance, keep a rendezvous with Hay at an isolated ranch in the Lake Tahoe country—the Sola Ranch, where we staged that big fight a few months back."

Lance nodded.

"In your plane is an instrument which is the kernel of the scheme. It arrives here to-morrow. It's a device which shoots an invisible beam fifty miles into the air, a negative beam, in sympathy with the machinery on the torpedoes. Hay sets this device near the Slav headquarters. The torpedo squadron takes off from a few hundred miles behind here, flying in the direction of the heart of the Slav forces. When they run into the beam, their motive power is nullified, and down they fall. Crash! The Slavs are wiped out. Our troops charge forward in a grand attack; the Slavs, with no armament, no reinforcing troops, no supply of tanks

and flame throwers, crumple. The invasion of America is put to an end!"

Lance rose. His face was alight, his eyes burning with strong, unquenchable fire.

"It's great, sir, great! It can't fail! By God, if it takes every last drop of my blood, I'll help Hay put this through!"

Colonel Douglas extended his right hand and Lance's met it in a firm shake. In the thick silence they stood thus for some minutes. Then, without moving so much as a cheek muscle, the colonel whispered, his eyes tense:

"The door! Fling it open! I think someone's been listening!"

Lance switched his alarmed gaze to it. His muscles went taut. The next moment he had leaped half across the room, jammed back the lock, and ripped the door wide.

At the other end of the dim passageway he glimpsed a scurrying figure!

Lance sprang after it with a shout to Douglas. Tearing out his automatic, he flung a burst of lead at the figure, but that instant it wheeled and sped from sight down another passage. And when Lance got there, no one was in sight.

For awhile he probed around, desperately, but could find no sign of anything. The base slept. Sorely troubled, he returned to find the colonel just coming back from an equally barren search:

"Don't think he heard much," said Douglas grimly. "It must have been that damned spy who's been getting information of our movements. I'll have the guards redoubled to prevent him from getting anything through." He smiled at sight of Lance's anxious face. "No need for too much worry, Lance! He couldn't have heard much—the walls are sound-proof and the door fairly tight. Now, you go and rip off some sleep! You need it! No more work for you till Wednesday night—you're too important!"

Sleep! Lance only wished he could. But the thrill of what he'd just heard was too fresh, too new; the blood pumped surgingly through his veins; his brain whirled with the thought of the glorious enterprise he and Hay were aiding so vitally.

Then, too, the night was humid and sweaty. For a while Lance lay on his cot, other sleeping figures to left and right of him, but his own eyes simply would not stay closed. Finally, after perhaps an hour of trying to doze off, he arose and, clad only in breeches and undershirt, wandered outside again with a cigarette glowing in his mouth.

The war might not have been, the night was so silent. Lance strolled lazily around the plane hangars, revelling in what little breeze there was. He seemed to be the only living thing abroad in the night.

Then, suddenly, he flung down his cigarette and ground the butt out quickly. For he saw he was not the only living thing abroad in the night. Sliding rapidly away from the end hangar was a dark form!

Lance crouched instinctively and crept forward. Who was the other wanderer? Not a sentry: they paced a regular beat closer to Douglas' office. Not another, who, like himself, could not sleep and had sought the open. This figure was going somewhere! It had a definite object in mind!

Sheltering himself behind the hangars' bulk, Lance advanced as stealthily as he could. Coming to the end one, he peered round its blunt corner. Fifty yards ahead, crossing a stubbly stretch of open ground, the mysterious prowler hurried onward.

The night was dark, the moon troubled by ragged bursts of listless, heavy clouds. Lance bent almost double and left the shelter of the black hangar. Feeling his way carefully, he followed the other.

Was this the unknown spy? The spy, going to transmit the news he had overheard?

Lance muttered a curse. He had no weapon with him; the spy, if he were a spy, would certainly be armed. But that didn't matter; it was merely unfortunate. He

must track the other down, at all cost.

For some minutes he crept on in this manner. The other kept hurrying forward. Lance noted a clump of brush far ahead; the figure was evidently making for this. And sure enough, as if acting directly on Lance's thought, the dark form entered the patch of growth—and did not come out on the other side.

Lance broke into a trot, eyes wary and alert for sign of his prey. At any second he might be greeted by a salvo of bullets, and every fiber of his lean body was taut.

As he approached the clump of brush he dropped to the ground, and came finally to it on his belly. From a distance of about ten feet, he rose and charged.

Expecting each moment to hear the spit of a revolver, he was more alarmed by what actually did greet him.

Nothing. The patch of brush was empty!

"Well I'll be damned!" Lance murmured. "Where did

he get to?"

He gazed around, bewildered. The growth of bush was about ten feet wide. On either side the flat Nevada plain stretched away—empty. No figure was visible.

Lance was utterly baffled. The fellow had vanished as if by magic. Flown away into thin air!

The young captain stood quite still, listening, probing his puzzled brain.

Then, like a cat, he dropped to the ground again, and pressed an ear to it. For his ears had caught a tiny betraying hum.

A hum! There was a machine of some type near him. He listened intently. The hum came from the ground on which he lay. There had to be a trap-door.

Lance's fingers scrabbled around, and presently found what they looked for.

He seized the ring which enabled one to pull the trap-door back, and was just about to pull when he heard, from below, a voice speaking in Russian. It was, then, the spy!

Lance grasped the ring anew, and, exerting all his strength, hauled the trap-door back.

A narrow passageway was revealed, lit by a lamp. The hum burst with doubled force on his ears. He plunged down, fists clenched, and half tumbled into a tiny room gouged from the soil.

At one end was a mass of machinery, and a microphone hung suspended before it. And speaking into the microphone was the heavy-set form of a man in American uniform, his back to Lance. As the latter charged down, he rose with an alarmed shout, and wheeled around.

"My God!" breathed Lance.

It was Ranth, Colonel Douglas' orderly!

Ranth!

His dark face flushed with fury, he came leaping from his seat. The wicked little revolver hung at his belt sprang out, but Lance's right fist shot forward, knocked Ranth's hand high and sent the gun clattering to the ground. Then, for a moment, they faced each other, the hum of the radiophone droning an ominous accompaniment.

"You!" Lance muttered. "So you were the spy!"

Ranth answered him with a choked oath and leaped forward again.

There were no niceties to that combat. It was a matter of life and death, and each knew it. Ranth would kill him, Lance knew, if he possibly could; and he, he had to kill or capture Ranth. Otherwise the news of the Torpedo Plan would go through, Ranth would return to the base, and the secret of the hidden radio never be known. Another would be put in Lance's place; and when Hay kept his rendezvous at Sola Ranch....

He had to win.

No effort was made at defense, for those first few furious minutes. A veritable fusillade of hurtling fists stormed through the air. They each gave and took equally. Then Ranth's heavy shoulders bunched; cunningly he feinted, then, whirling, swung a vicious right hand smash to Lance's chin.

Lance reeled, fell, seeing Ranth's hate-contorted visage dance queerly in the close air before him. The orderly clutched for his revolver, and Lance bounded up as if spring-impelled, nailed the other with two lightninglike jabs and unleashed all his strength in an uppercut which sprawled Ranth in a limp, quivering heap.

Panting, Lance surveyed him, then turned to get the gun. He felt the shock of thudding flesh in his legs, and fell again with Ranth scrambling on top of him. Steel-ribbed hands pounced on his throat, gouged savagely, while the man above grunted thick curses from his slaver's mouth. Lance struggled fiercely; saw a curtain of black rush down. Desperately he

hooked a booted leg up, craned it over Ranth's back, tugged. The terrible fingers loosened. Lance shook them off, rolled the other over and leaped once more to his feet, right hand clenched and ready.

Ranth staggered up. The young man measured him, pivoted, and smashed his beefy jaw with a clean swing that had every ounce of Lance's hard young body behind it.

The orderly shot back as if struck by a locomotive. He crashed into the radiophone, splintered the delicate instruments and slumped, eyes glazed, to the ground.

He was out. Dead out.

But how much had he got through on the radiophone before being stopped?

Had he told where the rendezvous, was to be? Told the time and place, and warned the Slavs to look for Hay?

Lance sighed, and was conscious that his left eye was

rapidly closing, that a lip was split and his whole body sore. He slung Ranth over his shoulders and trudged wearily back to the base.

He told his story to Colonel Douglas' amazed ears. Ranth, come back to life, was slapped in handcuffs, and for some time the colonel put him through a stern inquisition.

But his lips were sealed. He would not divulge how much he had succeeded in passing on to the Slavs.

"A brave man," Douglas observed grimly when Ranth was carried off to the brig, "but it's death for him, the same as it would be death for Hay were he caught."

"I don't think he had a chance to get much across, sir," Lance said. "I was right on him almost as soon as he got there. You won't let this cancel our rendezvous?"

Douglas' thin lips smiled narrowly. "No. You'll be taking a greater chance, Lance, but we must gamble on how much the Slavs know. You're game, aren't

you?"

"Yes, sir!"

Wednesday night came. Thunderstorms muttered to each other on the lowering horizons; gusts of fierce, wind-driven rain slanted down on the dripping base; occasionally a crooked finger of lightning probed the black sky and lit the whole sopping countryside with a searing, flashing glare.

The night patrol had taken off. A single plane, wet and gleaming under the sobbing heavens, stood on the tarmac, two heavily coated figures before it. Presently three more figures, carrying some bulky black object carefully between them, emerged from one of the buildings. Tenderly they placed this object in the lone plane, which had been stripped of radio outfit and gas bomb compartment to provide room. Then the two original figures were left alone once more before the fighting machine. Far to the rear, the heavy American guns barked in their regular nightly bombardment.

"A good night for it," Colonel Douglas, scanning the

sky, said, "and also a bad one. If only that damned lightning would stop!"

Lance, pulling on thick gloves, did not reply. The colonel consulted his watch.

"What time do you make it?" he asked.

"Exactly eight," the other answered.

"Right. At eight-six, you leave. At nine, on the dot, you meet Hay at Sola Ranch. At nine-ten, the torpedoes take off. At quarter to ten, they arrive over their destination—San Francisco and the surrounding territory. And quarter to ten, if things go correctly—which they must!—is the minute that ends the Slavish invasion of America. At ten minutes to ten, five minutes after the torpedoes strike, our troops charge forward in general attack. God be with you, Lance! The fate of America is resting on your shoulders tonight, remember!"

"I'm remembering."

Colonel Douglas looked at the young man's grim, set face, looked at his lithe, clean-limbed figure and his steady black eyes which burned with a purposeful fire. And the colonel smiled.

"We'll win!" he said.

An orderly sped from his office, saluted, and rapped crisply:

"Order just received from Washington, sir, to proceed."

Lance clasped Douglas' hand, and leaped into the snug, enclosed cockpit. The four motors bellowed as the thin-sprayed oil cascaded to them. The helicopter props spun around.

"Go to it, kid!" cried Douglas. "Spy or no spy, you're coming out on top! And give Hay a last handshake for me!"

And he swung to the salute.

Lance extended his hand. Then he gave his ship the gun, and the tiny, streamlined scout teetered, roared, and rose with a scream into the dripping darkness high above.

The Torpedo Plan had started.

PART IV

Lance hung for a moment at one thousand feet. A crack of lightning lit the base below for a second, and he perceived the colonel's straight figure with hand outstretched. Lance grinned, and gunned to forty thousand—an easy flying height, with his superchargers pumping and air-rectifiers normalizing the enclosed pilot's seat.

"But what," he wondered, as he stopped the helicopters, "did he mean by 'give a *last* handshake'?"

He was soon to find out.

Behind him, in the fuselage, nestled the weird cluster of machinery which was the Singe beacon. It certainly

did not look imposing—a mass of spidery tubes mazing round a bulky black box, which was, Lance guessed, some new type of generator. Out of the top of the device sprouted a funnel-like horn, from which, on the adjustment of the beacon's control studs, shot the nullifying ray. Lance could not suppress a shiver as he thought of the earth-shaking cataclysm that ray would conjure from the infinitely high heavens.

At forty thousand feet he was above the storm clouds, whose pitchy, vapor-drenched blackness effectively blanked out all sign of the earth. He might have been flying in outer space. Keeping a careful eye on his instruments, he set a course for Sola Ranch. He kept his speed around three hundred, wishing to meet Hay exactly at nine.

But—would Hay be there?

How much did the Slavs know? How much had Ranth got through before he stopped him?

A frown creased his brow. It was best not to puzzle over that question. Best just to go ahead, and keep

going.

At about three minutes to nine he set the plane's nose down through veils of clammy cloud. This was mountainous country, sparsely patrolled by Slav ships. Lance hovered cautiously over the firred mountain tops, getting his directions, shooting wary eyes through the magnifying mirrors in search of enemy scouts. He saw none. Satisfied, he cut the Rahl-Diesels, gunned the helicopter props and dropped lightly down on the stubbly field of Sola Ranch.

To left and right loomed the dim outlines of the lonely mountains. Before the war, the owner of Sola Ranch had grown apples; this field had housed a few horses. It made a perfect meeting place—secluded, misty with the clinging mountain vapors, far apart from the war.

Lance felt like a prowling werewolf there, waiting for its ghostly mate.

Rain was still splattering in desultory bursts, but distance muted the rumbling salvos' of thunder. His watch told him it was one minute to nine.

Now—what?

Hay, or a swooping squadron of Slav planes?

Lance stepped out of the cockpit into the rain, though holding himself tensely ready to leap back again and soar away. He stared around, and peered above.

Was that a shadow?—a nightmare flying bird?—or a plane?

He grasped a hand-flash, and rapidly signalled his identity. The next instant, it seemed, the shadow wavered, then fell earthward with great speed.

Out of the gloom and rain it came—an enemy plane.

It dropped down beside his scout. From its cockpit came a few swift flashes of light.

Hay!

Lance ran eagerly over to the other plane, and out from its enclosed cabin stepped the man he had

known as Praed.

Wordlessly, they gripped hands. Hay's thin, straight face wore a smile, and he met Lance's eyes keenly. Lance stammered:

"S-sorry, Captain Hay, about—about the way I treated you at the base. You see, I had no idea who you were."

Hay cut short his apologies with a laugh. "Rot! I'd've been the same way myself." He glanced rapidly at Lance's plane. "Got it?" he questioned. "I'm a bit late; had a hell of a time getting here without arousing suspicion. We'd best hurry."

Lance nodded. They hurried to the Goshawk. As they worked, carefully lifting out the Singe beacon, Lance, in crisp, short-clipped sentences, told his companion of Ranth, the spy.

"You don't know how much he got through?"

"No," said Lance. "No."

"Hm-m. Well, we'll have to trust to luck."

"You know the working of the beacon?" Lance asked. On the other's nod of affirmation he continued: "What's your plan?"

"Light about five miles this side of Frisco itself, just near the main Slav military base. Anywhere in that territory would do, though. The beacon doesn't go up in a narrow ray; it spreads, diffuses. The squadron of torpedoes will cover some fifty or sixty miles of ground, I believe. They'll utterly demolish the city, and every damned Slav in it." His face, in the darkness, went grim and hard. "And it'll damn well pay them back," he rasped, "for the horrible way they massacred San Francisco's population...."

The Singe beacon was in his plane. Hay turned to Lance, stretching out his hand for a farewell clasp. Then Lance asked the question that had been worrying him.

"Colonel Douglas told me to give you a last handshake for him. *Last*. Why did he say that?"

"Because," Hay said smilingly, "I'm staying by the beacon to make sure that nothing goes wrong. I guess that's why he said it, old fellow...."

Lance gasped: "You're sacrificing your life?"

"Of course. To save seventy-five million others."

Then suddenly they both stared above.

A roar of sound—of purring motors, of props, mixed with the chatter of a dozen machine-guns—had belched with numbing suddenness from the low-hanging clouds.

Enemy planes! A patrol of them!

"God!" jerked Lance. "Ranth's warning got through! Part of it, anyway!"

He leaped for his plane, shouting: "I'll hold 'em off! You get away *quick*!" and, through a veritable hail of lead, sprang into the cockpit.

Then, a cold pang at his heart, he sprang out again.

A bullet had caught Hay!

For a moment, the Slav fire ceased, while their planes zoomed up to start another death-dealing dive. And in that moment Lance was at Hay's side, where he had fallen.

"They—got me," whispered Hay, a stream of blood welling from his gasping mouth. "I'm—I'm going. C-carry me to—to your plane. I've still a—a little strength left. You take the beacon. I—I'll hold them—as—as long as—I can. Put through that beacon, boy! *Put it though!*"

His brain a maelstrom, Lance stared at the crumpled figure. It was the only way! He heard the motors above come roaring down again; desperately he carried the blood-choking Hay to his own plane; propped him limply at the controls. Bullets spat through a frenzy of noise. Weakly Hay started the Goshawk's Diesels, and weakly, into Lance's face, smiled, and beckoned him to leave.

And, as Lance, a grim resolve at his heart, turned, Hay's blood-frothed lips formed the words: "Carry on!"

Through the raining lead, seeming to bear a charmed life, Lance leaped to Hay's plane, hearing as he did so his own, with a stricken pilot at its controls, hurtle upwards.

Carry on! For the life of America!

Carry on!

Ten minutes past the hour of nine. A full thousand miles behind the lines, on the wide black field of America's major war base, a small group of men stood, surveying the awesome weapons assembled there.

Row upon row of huge, dully-gleaming cigar-shaped things stretched away into the darkness before them. There were only one or two faint lights to give illumination, and the night choked in on them, making them terrifying.

They resembled, more than anything else, half-sized dirigibles, being roughly about one hundred feet long and perhaps as much as thirty feet high. At first sight, they seemed to be numberless; then, as the bewildered eye became more sane, one could count them and see that there were, in reality, about thirty. Their prows were stubby; in the port side of each a tiny trap-door yawned, and standing by every trap-door was the overall-clad figure of a mechanic, waiting for the signal.

The Commander of the American Air Force looked up from his wrist-watch. At his side was a peculiar gnomelike figure, a figure with hunched, twisted back and huge, over-heavy head. This was Professor Singe, and from that ridiculous head had come the germ which had finally expanded into the torpedoes arrayed before him.

His eyes were nervous; his crooked face twitched ceaselessly. "Time?" he kept asking. "Time? Is it yet time?" And finally the tall figure of the Commanding Officer turned and rapped: "Time!"

An aide-de-camp raised a hand. As if working by some mechanical device, the figure which stood by each torpedo climbed through the trap-doors, jumped out a second later, and came running to the head of the field.

"About thirty seconds," muttered Singe nervously, eyes alight. "Thirty seconds for their motors to catch the stream. Thirty—ah!"

For the squadron of man-made horrors had stirred.

"God pity San Francisco!" murmured the Commanding Officer, and stepped back involuntarily as the whole fleet lifted their glyco-scarzite crammed bellies from the field and, as if moved by some magical, unseen, unheard force, shot up into the darkness with ever gathering speed.

"God pity it, indeed!" chuckled Singe exultantly. "It'll need it!"

The C. O. sighed and shook his head slowly. "War!" he mused. "And yet, it's our only chance." For a moment

he paused, seemingly unconscious of the macabre little form next to him, still gazing aloft at the now invisible torpedoes, and then muttered:

"And God pity Basil Hay, who's giving his life to America—a glorious, unselfish hero. God pity Basil Hay!"

American flyers never knew of Basil Hay's last fight. Had they, it would have become legendary.

For Hay fought a grim battle against two foes. One, he could face and conquer, as he had conquered often before. But the other lurked next to his dauntless heart, and it Hay could not subdue.

It was death.

Truly, Hay's fight there in the wet clouds above Sola Ranch was an inspired one. He fought almost by instinct alone, instinct twenty years of piloting had planted deep in his veins. He fought for Lance—for America. His eyes, glazing rapidly, could not distinguish the roaring phantoms that laced around

his lone plane, but uncannily his bursts of fire went home again and again, while theirs ripped aimlessly over the Goshawk's hell-driven snout.

Of course it could not last. Gallant spirit alone kept Basil Hay taut at his controls. Spirit alone thrust back the ever-increasing surge of black oblivion that pounded at his heart and brain. Spirit alone sent the pitifully outnumbered plane corkscrewing in peerless maneuverings that baffled the on-passing Slavs and thrust four of them to the sodden ground in flame. Spirit that would not surrender—but had to.

They could never have conquered Basil Hay in a plane. An ambushing bullet that caught him off guard did that. And finally Hay fell.

But he had kept them for ten full minutes. Ten minutes—each one a lasting, mute testimony to his unquenchable, unyielding spirit.

He flung a last salvo from his hot machine-guns, then, heart numbing, jerked back the control-stick and careened high. He slumped down. The plane paused,

wallowed crazily for a moment, and then roared earthward, "Carry on!" formed faintly on its dead pilot's bloody lips.

Basil Hay had fought his last fight.

Ten minutes....

Lance hadn't expected that long. He'd thought Hay would die in a few seconds. The man was mortally wounded; could not last.

Nevertheless, minutes or seconds, he was entrusted with the Singe beacon, and it was his job and his will to put it through.

He'd climbed the Slav plane up to its ceiling, driven it till it simply refused to go higher, and then roared on towards San Francisco. Each second he expected to see others come hurtling after him. When they did not, he knew how really great Hay's will was. It was an inspiring example.

But his brain was tortured by a multitude of

conflicting doubts. A patrol of Slav scouts had ambushed them. Just how much did the Slavs know, then, about the torpedoes?

He, Lance, had to guide the Singe beacon. Quickly he reviewed what Hay had told him.

"Light about five miles this side of Frisco. Anywhere in that territory would do, though. The beacon doesn't go up in a narrow ray; it spreads, diffuses."

Spreads, diffuses.

Hay had been clad in Slav uniform, and thus could, with a certain measure of safety, put the beacon machinery on the ground itself. But Lance was in American uniform; if he landed, he ran great risk of being noticed and attacked at once.

Lance saw immediately that there was only one way out. It was sure death, but Hay had expected death, and so must he.

His lips set in stern resolve. It meant good-by—

farewell to the girl he'd left behind, farewell to life, farewell to everything—but not for a second did he debate the course he would take.

Lance glanced at his watch. Nine-thirty. The torpedoes were even now on their way, hurtling along miles above the earth. In fifteen minutes they would be over San Francisco. In fifteen minutes the Singe beacon had to meet them.

He was not familiar with the Slav plane's instruments, but he judged he'd traveled some hundred and twenty-five miles; was nearing the outskirts of San Francisco. The air below would be thick, probably, with enemy scouts, but his appearance should pass unchallenged as long as they didn't glimpse his betraying uniform.

He set the plane's nose down in a long slanting dive.

Whipping through the clouds, the guarding search-rays of San Francisco were soon visible. Lance saw a few patrols of enemy scouts; he clung to the clouds, decreased his speed, and began circling over the

heart of the metropolis itself.

Twenty to ten.

Occasionally a Slav plane flashed by him. Thank God, they didn't challenge! Lance went still lower. Finally, at a thousand feet, he set the helicopter props in motion and hung in mid-air—directly above the very center of the city.

Sixteen minutes to ten.

Now!

In the American front-line trenches, massed troops crouched expectantly. Clustered on every air base were flights of planes, each one crammed with bombs. Far behind, the Yank gun-crews edged nervously up to their mighty charges, and fingered anxiously the stubby gas shells which soon would be flung through the dripping night.

And at Base No. 5 a very uneasy Colonel Douglas paced back and forth in his office, muttering: "No

news from Lance! No news from Lance! God! He can't have failed! But why doesn't he show up?"

He had not failed.

Hovering in the plane over San Francisco Lance squirmed round in his seat, reached back into the fuselage, and pressed rapidly the studs on the Singe beacon. A high whining noise pierced instantly through the plane. And up stabbed the beacon, invisible, deadly—up, up, up to a thin realm miles above, where it flashed into an awesome squadron of terrible shells of steel!

Shells that, a second later, wavered, staggered, and plunged earthward!

And Lance tensed in his seat. From above, he caught a tiny whistling noise—a whistling that hurtled into a terrific shriek—that roared ever closer.

"Carry on!" he muttered. "Carry on!"

The words froze on his lips, for the world was

suddenly consumed, it seemed, by flame and splitting, bellowing thunder.

The American guns spoke.

From every aerodrome long flights of scouts and bombers and transport planes roared upward.

In the front trenches the troops, still somewhat dazed by the earth-shaking explosion that had just tumbled from the far horizon—a horizon still lit by leaping tongues of awful flame—poured over the top, gas-masks on, repeaters and portable machine-guns at the ready, with a fierce cry on their lips.

Before that avenging attack the Slavs, their very spine broken, bewildered and confused, already turning in panic, could not stand.

America swept to the Pacific, and left death in her wake. And when she came to San Francisco, not even the sternest fighting men, still hot from battle, could repress a shudder, so awful was the devastation.

The Slav invasion was over!

In the rebuilt city of San Francisco there is a statue that stands proudly before the magnificent, gleaming city hall.

It represents two slim, straight-standing figures, clad in the uniform of the American Air Force. Their outstretched arms support a tiny one-seater Goshawk fighting plane.

Below, as you know, there is a plaque. Men touch their hats as they walk by it; flowers are always fresh at its base. On the plaque are the words:

To The Everlasting
Memory Of

Captain Basil Hay, A.A.F.
Captain Derek Lance, A.A.F.

Who, In The War Of 1938, Gave
Their Lives In Destroying And
Devastating San Francisco

That San Francisco And America
Might Live

70 The Tentacles from Below, by Anthony Gilmore

Down to tremendous ocean depths goes Commander Keith Wells in his blind duel with the marauding "machine-fish."

Aproximate word count:

Chapter 1: "*Machine-Fish*"

"Full stop. Rest ready."

These words glowed in vivid red against the black background of the *NX-1*'s control order-board. A wheel was spun over, a lever pulled back, and in the hull of the submarine descended the peculiar silence found only in mile-deep waters. Men rested at their posts, eyes alert.

Above, in the control room, Hemingway Bowman,

youthful first officer, glanced at the televue screen and swore softly.

"Keith," he said, "between you and me, I'll be damned glad when this monotonous job's over. I joined the Navy to see the world, but this charting job's giving me entirely too many close-ups of the deadest parts of it!"

Commander Keith Wells. U. S. N., grinned broadly.

"Well," he remarked, "in a few minutes we can call it a day—or night, rather—and then it's back to the *Falcon* while the day shift 'sees the world.'" He turned again to his dials as Hemmy Bowman, with a sigh, resumed work.

"Depth, six thousand feet. Visibility poor. Bottom eight thousand," he said into the phone hung before his lips, and fifty feet aft, in a small cubby, a blue-clad figure monotonously repeated the observations and noted them down in an official geographical survey report.

Such had been their routine for two tiring weeks, all

part of the *NX-1*'s present work of re-charting the Newfoundland banks.

As early as 1929 slight cataclysms had begun to tear up the sea-floor of this region, and of late—1935—seismographs and cable companies had reported titanic upheavals and sinkings of the ocean bed, changing hundreds of miles of underwater territory. Finally Washington decided to chart the alterations this series of sub-sea earthquakes had wrought.

And for this job the *NX-1* was detailed. A super-submarine fresh from the yards, small, but modern to the last degree, she contained such exclusive features as a sheathing of the tough new glycosteel, automatic air rectifiers, a location chart for showing positions of nearby submarines, the newly developed Edsel electric motors, and automatic televue screen. When below surface she was a sealed tube of metal one hundred feet long, and possessed of an enormous cruising radius. From the flower of the Navy some thirty men were picked, and in company with the mother-ship *Falcon* she put out to combine an exhaustive trial trip with the practical charting of the

newly changed ocean floor.

Now this work was almost over. Keith Wells told himself that he, like Bowman, would be glad to set foot on land again. This surveying was important, of course, but too dry for him—no action. He smiled at the lines of boredom on Hemmy's brow as the younger man stared gloomily into the televue screen.

And then the smile left his lips. The radio operator, in a cubby adjoining the control room, had spoken into the communication tube:

"Urgent call for you, sir! From Captain Knapp!"

Wells reached out and clipped a pair of extension phones over his ears. The deep voice of Robert Knapp, captain of the mother-ship *Falcon*, came ringing in. It was strained with an excitement unusual to him.

"Wells? Knapp speaking. Something damned funny's just happened near here. You know the fishing fleet that was near us yesterday morning?"

"Yes?"

"Well, the whole thing's gone down! Destroyed, absolutely! The sea's been like glass, the weather perfect—yet from the wreckage, what there is of it, you'd think a typhoon had struck! I can't begin to explain it. No survivors, either, so far, though we're hunting for them."

"You say the boats are completely destroyed?"

"Smashed like driftwood. I tell you it's preposterous—and yet it's the fact. I think you'd better return at once, old man; you're only half an hour off. And come on the surface; it's getting light now, and you might pick up something. God knows what this means, Keith, but it's up to us to find out. It's—it's got me...."

His tones were oddly disturbed—almost scared—and this from a man who didn't know what fear was.

"But Bob," Keith asked, "how did you—"

"Stand by a minute! The lookout reports survivors!"

Wells turned to meet Bowman's inquisitive face. He quickly repeated the gist of Knapp's weird story. "We saw them at dusk, last evening—remember? And now they're gone, destroyed. What can have done it?"

For some minutes the two surprised men speculated on the strange occurrence. Then Knapp's voice again rang in the headphones.

"Wells? My God, man, this is getting downright fantastic! We've just taken two survivors on board; one's barely alive and the other crazy. I can't get an intelligible thing from him; he keeps shrieking about writhing arms and awful eyes—and monsters he calls 'machine-fish'!"

"You're sure he's insane?"

Robert Knapp's voice hesitated queerly.

"Well, he's shrieking about 'machine-fish'—fish with machines over them!... I—I'm going to broadcast the whole story to the land stations. 'Machine-fish'! I don't know.... I don't know.... You'd better hurry back,

Wells!"

He rang off.

Keith slipped off the headphones and told Bowman what he had learned. Hardy, staunchly built craft, those fishing boats were; born in the teeth of gales. What horror could have ripped them—all of them—to driftwood, with the weather perfect? And a half-mad survivor, raving about "machine-fish"!

"Such things are preposterous," Bowman commented scornfully.

"But—the fleet's gone, Hemmy," Keith replied.

"Anyway, we'll speed back, and see what it's all about."

He punched swift commands on the control studs. "Empty Tanks, Zoom to Surface, Full Speed," the crimson words glared down below, and the *NX-1* at once shoved her snout up, trembling as her great electric motors began their pulsing whine. The delicate fingers of the massed dials before Keith

danced exultantly. The depth-levels tolled out:

"Seven thousand ... six thousand ... five thousand—"

"Keith! Look there!"

Hemmy Bowman was pointing with amazement at the location chart, a black mesh screen that showed the position of other submarines within a radius of two miles. In one corner, a spot of vivid red was shining.

"But it can't be a submarine!" Wells objected. "Our reports would have mentioned it!"

The two officers stared at each other.

"Machine-fish!" Bowman whispered softly. "If there were machines, the metal would register on the chart."

"It must be them!" the commander roared, coming out of his daze. "And, by God, we're going after them!"

Rapidly he brought the *NX-1* out of her zoom to the surface, and left her at four thousand feet, in perfect trim, while he read the instruments closely.

A green spot in the center of the location chart denoted the *NX-1*'s exact position. A distance of perhaps forty inches separated it from the red light on the meshed screen—which represented, roughly, a mile and a half. Below the chart was a thick dial, over which a black hand, indicating the mysterious submersible's approximate depth, was slowly moving.

"He's sinking—whatever he is," Keith muttered to Hemmy. "Hey, Sparks! Get me Captain Knapp."

A moment later the connection was put through.

"Bob? This is Wells again. Bob, our location chart shows the presence of some strange undersea metallic body. It can't be a submarine, for my maritime reports would show its presence. We think it has some connection with the 'machine-fish' that survivor raved about. At any rate, I'm going after it. The world has a right to know what destroyed that

fishing fleet, and since the *NX-1* is right on the spot it's my duty to track it down. Re-broadcast this news to land stations, will you? I'll keep in touch with you."

Knapp's voice came soberly back. "I guess you're right, Keith; it's up to you.... So long, old man. Good luck!"

In Wells' veins throbbed the lust for action. With control studs at hand, location chart and televue screen before his eyes and fifteen men waiting below for his commands, he had no fear of any monster the underseas might spew up. He glanced swiftly at the location chart and depth indicator again.

The mysterious red spot was slowly coming across the *NX-1*'s bows at a distance of about one mile. Keith punched a stud, and, as his craft filled her tank and slipped down further into deep water, he spoke to Hemmy Bowman.

"Take control for a minute. Keep on all speed, and follow 'em like a bloodhound. I'm going below."

He strode down the connecting ramp to the lower deck, where he found fifteen men standing vigilantly at posts. At once Keith plunged into a full explanation of what he had learned up in the control room. He concluded:

"A great moral burden rests on us—every one of us—as we will soon come face to face with a possible world menace. Anything may happen. A state of war exists on this submarine. You will be prepared for any wartime eventuality!"

Sobered faces greeted this announcement, and perceptibly the men straightened and held themselves more alertly. Wells at once returned to the control room. A glance at the location chart and its two tiny lights told him that the intervening distance had been decreased to about half a mile.

The depth dial showed them both to be two miles below, and steadily diving lower. Charts showed the sea-floor to be three miles deep in this position, and that meant—

"Look there!" exclaimed the first officer suddenly. "It's changing course!"

The crimson stud had suddenly shifted its course, and now was fleeing directly before them. For a moment the distance between the green and red lights remained constant—and then Keith Wells stared unbelievably at the chart, wiped a hand across his eyes and stared again.

"Why—why, the devils are as fast as we!" he exclaimed in amazement. "I think they're even gaining on us!"

"And there's no other submarine in the world that can do more than thirty under water!" Hemmy Bowman added. "We're hitting a full forty-one!"

A call came through the communication tube from Sparks. "Report from Consolidated Radio News-Broadcasters, sir, aimed especially at us."

"Well?" asked Keith, motioning Hemmy to listen in. Sparks read it.

"A week ago Atlantic City reported that seven men were snatched off fishing boat by unidentified tentacled monsters. Testimony of witnesses was discredited, but was later corroborated by the almost identical testimony of other witnesses at Brighton Beach, England, who saw man and woman taken by mysterious monsters whilst bathing.' Perhaps these same creatures destroyed the Newfoundland fishing fleet." His level voice ceased.

"Tentacled monsters ... 'machine-fish,'" Wells murmured slowly. "'Machine-fish.'..."

Their eyes met, the same wonder in each. "Well," Keith rapped at last, "we're seeing this through!"

He turned again to the location chart. The green spot as always was in the center, and at a constant distance was the red, showing that the *NX-1* was hot on the other's trail. The depth dials indicated that both were diving deeper every moment.

"Where in hell's it going?" the commander rasped. "We'll be on the floor in a few minutes!"

Here the televue showed the world to be one of fantasy, one to which the sun did not exist. It was not an utter, pitchy blackness that pervaded the water, but rather a peculiar, dark blueness. No fish schools, Keith noted, scurried from them. They had already left these waters; aware, perhaps, of the passing Terror....

They plunged lower yet. Wells was conscious of Hemmy Bowman's quick, uneven breathing. Conscious of the tautness of his own nerves, strung like quivering violin strings. Conscious of the terrific walls of water pressing in on them. And conscious of the men below, their lives bound implicitly in his will and brain....

A thought came to him, and quickly he reached into a rack for the chart of the local sea-floor. His brow creased with puzzlement as he studied it.

"Here's more mystery, Hemmy," he muttered. "Look—there's an underwater cliff about half a mile dead ahead. It rises to within four thousand feet of the surface. And that thing out there is charging straight

into its base!"

"They must be aware of it," jerked the other. "See?—they've stopped!"

It was true. The gulf between the two colored spots was rapidly being swallowed up. At a pulsing forty-one knots the *NX-1* was closing in on the motionless mystery craft.

"They're sinking to the floor itself," observed Wells. "Perhaps waiting to attack."

The invisible beams from their ultra-violet light-beacons streamed through the silent gloom outside, yet still the televue screen was empty. Keith punched a stud, and the *NX-1*'s whining motors dulled to a scarcely audible purr.

"What is the thing?" muttered Hemmy Bowman. "God, Keith, what *is* it?"

For answer, the commander dropped them the last five hundred feet. The sea-floor rose like a gray ghost.

More control studs were pushed; the order-board below read: "All Power Off, Rest in Trim." The location chart told a tale that wrung a gasp from Bowman's throat. The red and green lights were practically touching....

The hands of Petty Officer Brown, the helmsman, were quivering on the helm. Wells' fists kept tensing and relaxing as he peered for a sight of the enemy in the televue. Nothing showed but the moving fingers of spectral kelp. Then both he and Bowman cried out as one:

"There!"

Chapter 2: The Silent Ray

A strange shape had suddenly materialized on the screen—an immense, oval-shaped thing of dull metal, with great curving cuts of glass-like substance in its blunt bow, like staring eyes; a lifeless, staring thing, stretching far into the curtain of gloom behind. How long it was, Keith could not tell; at first his numb brain refused to grasp it and reduce it to definite, sane standards of size and length. The cold weeds of the sea-floor kelp beds swayed eerily over and around it. From its bow, he saw, peculiar knobs jutted, the function of which he guessed with dread.

Was it waiting with a purpose? Was it waiting—and inviting attack?

A frightened whisper from Hemmy Bowman broke the hush:

"Keith, the thing has ports, but shows no lights! What kind of creatures can they be?"

As he spoke, the three men in the control room felt

the unmistakable, jarring tingle of an electric shock. And while their nerves still jumped, it came again; and again. They were conscious of a slight feeling of drowsiness.

Keith gaped at Bowman and Brown, and then a flash on the televue screen drew his eyes. There, against the blackness of its otherwise inanimate hulk, one of the jutting knobs on the bow of the mysterious submarine was glowing and pulsing with orange life! With it came the tingling shock again. It flicked off as they watched, then returned and went once more.

"They're attacking, but thank God the shock was harmless!" Wells said grimly. "All right; they've asked for it: I'm going to see how they like the taste of a torpedo!"

The two submarines were resting on the ocean floor with perhaps two hundred feet between them. The *NX-1*'s bow tubes were not exactly in line to score a direct hit; she would have to be maneuvered slightly to port. The range was short; the explosion from the torpedoes would be titanic.

Keith punched the control studs, ordering the men below to assume firing stations. Then, while waiting for the *NX-1* to shift, he studied the televue screen to sight the range exactly. The black dot which represented the enemy craft was not directly on the crossed hair-lines of the dial-like range-finder, but shifting the *NX-1* a few feet would bring it to the perfect firing point.

But the *NX-1* did not budge.

Surprised, her commander swung and looked at Bowman. "What the devil?" he cried. "Did that shock—?" He left the dread thought unfinished and leaped to the speaking tubes.

"Craig! Jones! Wetherby!" he yelled. "Men! Don't you hear me? Aren't you—"

He broke off, wordless, waiting for an answer that did not come, then sprang to the connecting ramp and ran to the deck below.

The scene he found halted him abruptly in his tracks.

Every member of the crew was sprawled on the deck, in grotesque, limp postures. They had been standing rigidly at posts, he saw, when the thing, whatever it was, had struck. Without a sound, without a single cry of alarm, the *NX-1*'s crew had been laid low!

The commander slowly advanced to the deck and stared more closely at the upturned faces around him. He saw that every man's eyes were open.

Bending over one still form, he pressed his hand on the heart. It was beating! The man was alive!

Amazed, he moved to another and another: they were all breathing, slowly and regularly—were all alive! A curious look in their eyes staggered him for a moment. He could swear that they recognized him, knew he was staring at them—for every single pair was alight with intelligence, and Keith fancied he saw gleams of recognition.

"It must have been a paralyzing ray!" he gasped. "A thing our scientists've been trying to develop for years.... And that monster outside knows the secret...." He lifted an arm of the inert figure at his

feet; when he released the grip, it flopped limply back to the deck again.

"Keith! Come back, quick!"

Startled, the commander turned to find Hemingway Bowman at the top of the connecting ramp, his face distorted with alarm.

"For God's sake, come back quick!" he yelled again.
"Down there the ray might get you!"

With the words, Wells leaped to the ramp and raced to the control room. He had no sooner made it than he felt again the queer tingle of the electric charge. He found himself trembling. Bowman's face was white. His words came stuttering.

"One second later and they'd have got you.... They got Sparks in his cubby.... You see, the ray doesn't affect us in the control room because—"

"Because the Gibson insulation that protects the instruments keeps it out!" Keith finished grimly. "I

see!"

Just then a slight jar ran through the submarine. Coincident with it came a cry from Brown, the helmsman. His arm was pointed at the televue.

There they saw the enemy's mighty dirigible of metal was now within thirty feet of the *NX-1*. It had crept up silently, without warning. And, spanning the short gulf between them, an arm of webbed metal craned from the other's huge bow, hooking tightly into the American submarine's forward hawser holes!

As they took this in, the enemy ship moved away and the arm of metal tightened. The *NX-1* shuddered. And, at first slowly, but with ever increasing speed, she got under way and slid after her captor. They were being towed away. Kidnaped! Men, submarine and all!

Keith Wells mopped sweat from a hot brow and rapidly reviewed his weapons. He was sorely restricted. Through an emergency system the *NX-1* could be propelled and maneuvered from her control room; but the torpedo tubes needed local attendance.

"Hemmy, reverse engines," he jerked, himself spinning over a small wheel. "Let's see if we can out-pull the devil!"

At once they felt the shock of the paralyzing ray, and then the surging whine of the Edsel electrics pulsed up and in the televue screen they watched the grim struggle of ship against ship.

Imperceptibly, almost, as her screws cut in and churned, the forward progress of the *NX-1* was slowing, the speed of the other being cut down, until finally they but barely forged ahead. Slowly, ever so slowly they were out-pulled; inch by inch they were dragged ahead. Their motors could not hold even.

"She's more powerful than we!" Wells' bitter voice spoke. "Damn!" He thought desperately, while Bowman and Brown stared at the fantastic tale the televue spelled out.

Again the paralyzing shock tingled, an intangible jailer that bound them, more surely than steel bars, to the control room. To dare that streaming barrage

meant instant impotence, and perhaps, later, death....

"Our two bow torpedoes," Keith mused slowly. "We're a bit close, but it's our only chance. The ray comes at intervals of about a minute; the torps are ready for firing. If one of us could dash forward and discharge 'em.... Brown, that's you!"

The petty officer met his commander's gaze levelly. He smiled. "Yes, sir, I'm ready!" he said.

"Good! It'll have to be quick work, though; I'll try and keep the sub pointed straight. Wait for the ray, then run like hell!"

The first officer took over the helm and Brown stepped to the forward ladder, waiting for the periodic ray to be discharged.

The odd tingle came and vanished. "Now!" Wells roared, and Brown leaped down the thin steel rungs.

He staggered at the bottom from the force of his impact, then straightened and raced madly forward.

Through the drone of the motors the two officers could hear the staccato beat of his feet.

But their eyes were glued to the televue. Through clutching beds of seaweed the enemy submarine was ploughing. Her great, smooth bow lay straight ahead, metal hawser arm spanning the thirty feet between them. In another second, Keith thought grimly, two dynamite packed tubes of sudden death would thunderbolt into that hull, and—

Brown pulled the lever.

The tubes spat out compressed air; a scream ran through the submarine; and the two steel fish leaped from their sheaths, their tiny props roaring. Over the narrow gulf they shot; the range was short, their target dead ahead—and yet by bare inches they missed!

No answering roar bellowed back. Keith had watched their course; had seen them flash by the enemy's bow, flicking it with their rudders, but nothing more.

"Why?" he cried. And, as Bowman moved his hands in

a hopeless gesture, he saw in the televue the reason.

It was a jagged pinnacle of rock, which, just before Brown had fired, had been straight ahead. The towing monster had seen it and veered sharply to avoid crashing. The barest change of course, yet sufficient to avoid the torpedoes....

Wells and Bowman were cursing savagely when the sound of Brown, racing desperately aft, jerked the commander to the ladder. He saw the petty officer at its foot. "Hurry!" Wells shouted. "The ray!"

Brown grasped the steel rungs and scrambled upward, but he was too late. The fatal charge tingled. A peculiar, surprised expression washed over his face; his hands loosened their grip. For a second his eyes looked questioningly at his commander; a faint sigh escaped him; and then his arms flung out, his body relaxed, and he slumped like a slab of meat to the deck below....

Keith Wells saw red. Blind to everything, he was just about to charge down the ladder to himself re-load

the forward tubes when the grip of Hemmy Bowman's hand stayed him. The thing Hemmy was staring at in the televue screen sobered him completely.

The wall of rock to which the enemy submarine had first been charging had become visible, soaring vastly from the gloom of the sea-floor. And the monster was towing them straight into a dark, jagged cleft at its base.

"It's a cavern!" Keith breathed. "A split in the rock—the lair of that devil. And we're being dragged into it!"

Chapter 3: Sacrifice

At that moment Keith Wells knew fear. Each second they were being hauled closer to the monster's dim lair. It lay there, dark, mysterious, fingered by gently swaying, clammy kelp. A hushed solitude seemed to reign over it, aweing all undersea life from the vicinity.... Wells turned his head to meet Bowman's eyes, and read in them a silent question.

What now?

He groaned in the agony of his mind. In a few minutes, all would be over. Once the *NX-1* was dragged into that dark cavern there'd be no chance of escaping to warn the world above, of saving the submarine. What now? The question brought beads of sweat to his tormented brow. He, Keith Wells, standing impotently by while his ship, the pride of the service, was hauled inch by inch to some strange doom!

Racked by these thoughts, he murmured tortured, jerky phrases, unconscious he was giving voice to the

things that flogged his brain.

"What can I do? I've got to save my ship—I've got to get back to break the news—I've got to tell the world! But how? How—" His expression changed suddenly. "That's it! That hawser arm between us must be broken!"

"Yes."

First Officer Hemingway Bowman's clear voice broke in on the older man's thoughts with that one crisp word. Keith swung to find the other's eyes fixed levelly on his.

"You're right, Keith. The hawser arm must be broken; with a depth charge, of course. It's the only way.

"To attach a depth charge," he continued evenly, "a man must leave the ship. You can't, Keith. It will be me."

The commander did not speak. "I'll put on a sea-suit," Hemmy went on quickly, eyes lighting. "You tip the

submarine and I'll slide out the conning tower exit port on the lee side, so they can't see me, and worm forward through the kelp. We're almost holding them even; that'll be easy. I'll be protected from the paralyzing shock until the last second, and it may not get me outside; that'll have to be chanced. The hawser arm's only some ten feet above the sea-floor; I can reach it with a hook on the charge." He paused.

"I'll attach it; and when it bursts I'll try to get back and grab that ring on the midships exit port, and you can let me in when we get to the surface. But if I take too long, Keith—if I miss—you beat it without me. You understand? Beat it!"

He gazed straight at his friend. "Understand, Keith?"

Commander Keith Wells bowed his head in acquiescence. He was afraid that if he met Hemmy Bowman's steady eyes he'd make a fool of himself....

Hemmy glanced at the screen once more, shivering as he saw how near the black cavern was. Then he moved rapidly, playing the cards carefully for his

gamble with death. He had to: the trumps were in the other hand.

From the locker where their sea-suits were stowed he grabbed his own, and with quick fingers ripped the slides and fitted it on. A sheath of yellow Lestofabrik, its weighted feet and gleaming casque transformed his slim figure into a giant such as might stalk through a nightmare. Built cunningly into the helmet was a tiny radio transmitter and receiver, with a range of a quarter-mile; hugging to the shoulders, inside nestled the air-making mechanism, its tiny generators already in motion. Around the helmet was fastened a small removable undersea-light. The wrists of the suit were very flexible, permitting the freest motion.

Once in the suit, Hemmy smiled through the still-opened face-shield.

"Got the depth charge ready, Keith? Make it fast—that cavern's near!... Good!"

Silently the commander fitted the black bomb to his

friend's shoulders. It was timed to fire a minute after being set. A long wire hook craned from its top, and this hook Bowman would fasten on the hawser arm.

"Without Sparks, I guess I'll have to communicate with you through portable," Keith said, and quickly donned one of the tiny portable sets.

"Right. Ready, Keith."

Bowman started his awkward, crawling progress up the ladder into the conning tower just above, Keith helping from behind. When they stood before the exit port on the lee side, Wells shot back its bolts and the door swung open, revealing the black emptiness of the water chamber. The commander gazed for a second into Bowman's eyes. The moment had come.

Keith turned his head away, felt a hand grip his. He wrung it tightly....

Bowman clumped into the chamber.

The commander closed and locked the door, and he

heard the streaming water pour in as Hemmy turned the valve. Then Wells sped down the ladder and tilted the diving and course rudders of the submarine.

She swayed daintily over to port; held there. A moment later the recurring electric tingle brushed him. Had the enemy seen Bowman leave? Had the ray struck him down?

He glared into the teleview. "Thank God!" he breathed. For Hemmy had already slid down the *NX-1*'s smooth hull and was safe on the sea-floor beside her.

"Everything right?" Wells asked, speaking into the microphone of his portable.

"All O.K.," came the answer. "Going forward now. Kelp thick as hell."

Keith's eyes bored at the screen. This misshapen monster who was his friend! Almost obscured by bands of thick-leaved kelp the yellow form moved, hands clearing a pathway through the weeds. Slowly

but surely he made for the bow of the submersible.

"Hard going, Keith. God—the cavern's right ahead!"

It was ghostly to hear Hemmy's warm voice from the lifeless solitude outside. Breath coming quickly, Wells watched the silent scene—the cleft in the wall of rock overshadowing everything now. The diver fought ahead, gaining inch by inch.

Now, save for occasional clumps of weed, he was exposed to the enemy.... Now the last desperate gauntlet was reached.... Keith felt his blood pound hotly.

"I'm gaining, Keith. Gaining...."

Bowman had little breath for speech. His tiny form battled on, now sinking from sight as he dropped into some masked gully, now wrestling slowly with great swaying strands of kelp, but always struggling ahead.

"I'm at the bow, Keith! The hawser arm's right in our mooring holes. I'll go halfway before fastening the

charge. Any signs of life from the devil?"

"None yet, Hemmy. But go slow. Hide all you can, old man, for God's sake!..."

Right beneath the metal arm, Bowman's dwarfed figure crept doggedly ahead. Forward, inch by breathless inch. Kelp thickened, washed away; the two hulking submersibles, captor and captive, surged onward—but just a little faster went the valiant figure with the black charge on its back.

The towing monster had its snout in the cavern. The darkness thickened. Bowman was quarter way!

He plunged desperately. Half way!

"I'm there, Keith! Now for it!"

"Oh, God!" Wells cried. "They see you; they're coming!"

For he had seen strange shapes leaving the enemy submarine.

And at that same moment, Bowman saw them, too.

They came like the blink of a dark eye from a door that had quickly slid open in the mysterious ship's bow. As tall as a man they were, and there were two of them, though at first the nature of their bodies merged with the wreathing kelp made them seem like a dozen. Bowman stared at them, hypnotized with fear. His legs and arms went dead, and his whole gallant spirit seemed to slump into lifeless clay. Now he knew why the fishermen had shrieked "machine-fish." Each one of them had eight tapering arms, eight restless tentacles. These were octopi, most hideous scavengers of the ocean floor! And not only octopi—but octopi sheathed in metal-scaled armor!

As they came closer, he realized this preposterous fact. The dark substance of their writhing tentacles was not flesh: it was a coat of metal scales. And the fat central mass which held their eyes and vital organs and beaked jaw—this mass was completely enveloped by a globe of glass. From inside, he could see great eyes staring at him. The monsters came towards him quite slowly, obviously wary, advancing

over the sea-floor in what was a hideous mockery of walking, their forward tentacles outstretched.

With a sob, Hemmy Bowman pulled himself from his trance. He glanced back at the *NX-1*. He still had time to retreat. He might be able to get back inside before these monsters seized him.

But that meant abandoning his job. And already his own submarine was nosing into the cavern. The choice between the octopi and retreat stared him in the face. He pulled himself together and jerked his arms back to action.

Eyes bulging, Keith Wells peered at the dim televue screen. He saw the creatures approaching Hemmy. And then, suddenly, he remembered his radiophone.

"Hemmy! Come back, for God's sake!" he cried.

"Come back while you can—it's hopeless!"

But Bowman had already seized the depth charge from his back and hooked it on the hawser arm above.

Immediately, with that action, all caution fled from the approaching monsters. Their tentacles whipped furiously; and in a great arc they sprang for the tiny figure of the diver.

With a deep breath, Hemmy staggered forward to meet them. "Keith!" he gasped. "I'll try to hold 'em away from the charge! When it bursts, zoom! Zoom like hell to the surface!" And then the tentacles had him.

Keith watched, cursing his impotence to help. Hemmy had no weapon; he was trying to hold them back by the weight of his body; he reached out and grasped a tentacle and hugged it to him, shoving forward with all his puny strength. But all his effort was as nothing. One of the octopi writhed past him and darted onto the depth charge. Its tentacles tugged at the bomb; pulled furiously.

The time charge exploded. The *NX-1* rocked like a quivering reed; Wells was knocked violently to the floor; a vast roar smote his ear-drums. When he staggered to his feet he found that the octopus that

was pulling at the charge had disappeared—blown into fragments of flesh and metal. But the hawser arm was broken! The *NX-1*, free, shot back a full fifty feet under the pull of her reversed screws. A cry echoed in her commander's ears:

"Go back, Keith! Go like hell!"

He saw the remaining octopus lift Bowman and whip to the exit port of its submarine. The lid slid into place, closing on the monster and his friend, and the enemy ship vanished into the black cavern....

Once clear of the opening, Keith set his motors full forward and brought the diving rudders up. Quickly the ship sped from the haunted sea-floor to the sun-warmed surface. A last thin call rang in his radiophone:

"They've got me inside, Keith. It's dark, and filled with water. I can't see anything, but I—I guess we're going through the cavern.... Forget about me, old boy. So long! So—"

The voice was abruptly cut off.

Keith ripped the instrument from his head. Then, face white and drawn, he ran to the radio cubby. Standing over Sparks' inert body, he put through a call to Robert Knapp, on the *Falcon*.

"Knapp?" he said harshly. "This is Wells. I'll be with you in a few minutes. Yes—yes—I'll tell you the whole story later. But get this now: Have the day shift all ready to take over the submarine by the time I pull alongside."

He said no more just then; but rang off, and, looking back, he muttered savagely:

"But I'll be back, Hemmy—I'll be back!"

Chapter 4: In the Cavern

"That's the story, Knapp. They got Bowman, and I had to run away. Their ship disappeared into the cavern. I've got a hunch, though, that it's not just a cavern, but a tunnel, leading through to some underwater world. That series of sub-sea earthquakes probably opened it up; and now these devil-octopi are free to pour out. I've *got* to find out what's what, and that's why I'm going down again as soon as the torpedo system's ready!"

Keith and Robert Knapp were in the *Falcon's* chart room. On the table before them lay a broad white map with a cross-mark indicating the position of the mysterious dark cavern.

Wells was striding up and down like a caged tiger in his impatience to be off. Every other minute he glared down to where the *NX-1* lay alongside. On her conning tower stood the tall blond-haired figure of Graham, the first officer of the day shift, supervising the final details of the work of installing a system of jury controls whereby the submarine's torpedoes

could be fired from her control room.

Keith stopped short and faced Knapp. "It won't be so one-sided this time, Bob," he promised. "You see: when the location chart shows the enemy ship, I'll rush all men into the control room, where the paralyzing ray can't harm them. I don't know but what they have in other weapons, but I'm gambling on getting my torps in first. They've killed Bowman; they've ravaged a whole fishing fleet; they're free to emerge from their hole and maraud every ocean on the globe! They've got to be stopped! And since I'm armed and have the only submarine on the spot, I've got to do it! I know how to fight them now!"

Captain Robert Knapp's sense of things was badly disordered. He had just heard a story which his common sense told him couldn't be true, but which the evidence of his eyes had grimly authenticated. He had seen fifteen men slung aboard his ship from the *NX-1*'s silent hull; men stretched in grotesque, limp attitudes; men struck down by a paralyzing ray. Why, no nation on earth had developed rays for warfare! Yet—a crew of helpless men was even then in the sick

bay, receiving attention in the hope that they might recover.

"You're going right through that cavern, then, Wells?" he asked incredulously. "You're going to investigate what lies beyond?"

"Nothing else! And I won't come out till I've blown that octopi ship to pieces!"

"It sounds preposterous," Knapp murmured, shaking his head. "Octopi, you say—and clad in metal suits! Running a submarine more powerful than the *NX-1*! Armed with a ray—a paralyzing ray! I can't believe—I can't conceive—"

"You've seen the men!... Knapp, if I were you I'd swing my eight-inchers out, bring up the plane catapult and keep the deck torpedo tubes loaded and ready. It's best to be prepared; God knows what's going on underseas these days!"

First Officer Graham appeared at the door. "Work finished, sir," he said. "Ready to cast off."

"Thank heaven!" Wells muttered, and stretched out his hand to Robert Knapp. "Broadcast what I've told you, Bob, and say that the *NX-1* won't be back till everything's under control. I'll keep in touch with you. So long!" And he was gone before the captain could even wish him good luck.

Orders raced from her commander's fingers on the stud board in the control room. "Crash Dive" filled her tanks and put her nose perilously down, so that in thirty seconds only a swirling patch of water was left to show where once she'd lain. A brief command to the helmsman and she pointed straight for the dark cavern marked on the chart.

When well under way, Keith descended with Graham to inspect the new torpedo firing system, and found it in good working order. "Graham," he ordered tersely, "instruct the crew fully about rushing to the control room on one ring of the general alarm. And send the cook up to me in a minute or so. I'll be in Sparks' cubby."

Above again, he instructed the radio man to rig a

remote control sender and receiver in the insulated control room. The need for centering the whole crew there during engagements would crowd the room awkwardly, but at other times, while proceeding on their inspection of the cavern lair, they could remain at their regular posts.

That, at least, was Wells' plan.

He looked up and found the cook, McKegnie, grinning at him from the door of the control room. Keith smiled, running his eyes over the portly magnificence of his gently perspiring figure. "Keg," he said cheerfully, "I want you to move your hot plate and culinary apparatus up here; you see, we're all likely to be crowded in here for some time, and your coffee's going to be an absolute necessity." He couldn't resist a crack at McKegnie's well-known and passionate curiosity as to what made the thigmajigs of the control board work: "And besides, it'll give you a chance to observe the instruments and perfect yourself for your future career as a naval officer. Much better than a correspondence course in 'How to Be a Submarine Commander,' eh?"

Cook McKegnie grinned sheepishly, and left. He was well used to such jests, but he never would admit that his extraordinary interest in watching the ship's wheels go round was accompanied by a miraculous inability to comprehend why they went round....

Fifteen minutes later the helmsman's cry, "Cavern showing, sir!" swung the commander to the televue screen. The dark, kelp-shrouded opening he knew so well was already looming on it. And he was prepared.

"Enter," he said, while his punched studs ordered, "Quarter Speed, Ready at Posts, Tanks in Trim." The *NX-1* slackened her gait, balanced cautiously, and struck a straight, even course as she crept closer to the cleft entrance through which, some two hours earlier, the octopi ship had nosed.

Screws turning slowly, she edged through the jagged cavern. Shades of inky blackness grew on the televue and danced in fantastic blotches; the screen turned to a welter of black, threatening shadows; became a useless maze of ever-changing forms. Keith mouthed curses as he stared at it; he now had nothing

by which to judge his progress, to maneuver the submarine, save directional instruments and, perhaps, chance scrapings of the tunnel's ragged walls against the outer hull. The *NX-1* was running a gauntlet of immeasurable danger, her only assurance of success being the fact that a larger craft had preceded her.

But how far, Keith wondered, had that ship preceded her? How was he to know that it had gone straight through? There might be a dozen different turnings in this tunnel: the submarine could easily tilt head-on against a jagged rock and puncture her hull. There might be mines planted directly in their course; he might be swimming straight into some hideous ambush.

He drove these thoughts from his mind. The passage had to be made on the fickle authority of the senses; and, realizing this, Wells took the helm into his own hands. Graham was posted at the location chart, with instructions to report the red light if it showed.

Down below, the Edsel electrics were humming very

softly; the men stood vigilantly at posts. On their brows were little beads of sweat, and here and there a hand clenched nervously. All knew they were in a tight place; otherwise they were ignorant of where their commander was leading them. Occasionally a long, shivering rasp ran through the ship as her hull nudged the rough tunnel wall. Then the course rudders would swing gently over; and perhaps, almost immediately, another grinding cry of rock and steel would come from the other side. Then would come quickly indrawn breaths as the rudders swung again and the humming silence droned on.

The scrapings came quite often. Often, too, the motors would go silent altogether, and the *NX-1* would rest almost motionless as her commander felt for an opening. It was a tense, nerve-wringing ordeal. The silence, the waiting, the dainty scrapings were maddening.

Keith Wells' skin was prickling. He kept only fingertips on the tiny helm: he was playing that uncanny sixth sense of the submarine commander. When it misled him, the rasping rock groaned out,

scarring the submarine's smooth skin. Generally, the tunnel was straight; but each time he heard his ship rub against some exterior obstruction, his teeth went tight—for who knew but what it might be a mine?

They had penetrated perhaps a half-mile when Graham, eyes steady on the televue, reported: "Light growing, sir!"

Wells saw that the screen was filling with a soft, faintly glowing bluish color. The walls of the tunnel became visible, and he noted that they were widening out, funnel-like. He dared to increase speed slightly. Three minutes later he saw that the blue illumination was seeping from the end of the tunnel. They continued out.

"Thank God, we're through!" he muttered to Graham. "You see, I was right! It's an underground sea—and we're at the top of it." For the instruments indicated a depth beneath them of roughly three miles. They were in, evidently, a large cavern, of vast length and depth.

The *NX-1* continued slowly forward, two pairs of eyes intent on her televue screen. Keith jotted down the tunnel's position, and the funnel-shaped hole sank away behind their slow screws. And then, upon the location chart, a faint red dot suddenly glowed!

It was upon them in a flash. A small tube of metal, shaped somewhat in the form of the big octopi submarine, had darted up from below, hovered a second close to them, and then, almost before they realized they were being surveyed, sped back into the mysterious depths from which it had come.

"A lookout, I suppose," Keith muttered, breathing more easily. "Couldn't have held more than two of those creatures.... Well, the alarm's out, I guess, Graham, but it can't be helped. Let's see what it's like down below."

They plunged steadily down, then ahead. And presently there grew on the televue vague forms which widened their eyes and made their breath come quicker. Keith had guessed the tunnel led to a civilization of some kind, but he was not prepared for

the sight that loomed hazily through the soft blue water.

Strange, moundlike shapes appeared far below, mounds grouped in orderly rows and clusters, with streets running between them, thronged with tiny, spidery dots. Octopi! It was, the commander realized, a city of the monsters—a complete city like those of surface peoples! For several miles in every direction the water-city spread out, farther than the televue could pierce. Wells marveled at this separately developed civilization, this deep-buried realm of octopi whose unexpected intellectual powers had permitted such development. Perhaps, he pondered, this city was only one of many; perhaps only a village. He could but vaguely glimpse the queer mound buildings, but saw that they were of varying height and were filled with dark round entrance holes, through which the creatures streamed on their different errands....

He saw no schools of fish around. "I guess they've been all killed off, or eaten," he commented to the wonder-struck Graham. "Probably the octopi have

separate hatcheries where they raise them for food."

"But—good Lord!" the first officer exclaimed. "A city—a city like ours! Down here, filled with octopi!..."

"Yes," answered Wells grimly, "and this 'city' may only be a small settlement; there may be scores of these places. We'd better continue ahead now that we're here; for we've got to get all the information we can. I only hope these monsters haven't more than one big submarine. We can expect an attack any minute...."

The *NX-1* pressed on. The city dropped behind. A breathless tenseness had settled down over the submarine; she was proceeding with utmost caution, her anxious officers alert at the location chart. The great fear that tormented them was that they might be attacked, not by one, but by a fleet of the octopi ships....

Then, at the rim of the chart, a red dot appeared! It grew rapidly, charging down on them at great speed. The spot was large; this was no small sentry boat! At once the alarm bell shrilled its warning; the crew

below left their posts and raced to the control room. With sure mechanical fingers the emergency system gripped the valve handles and motor levers; Keith swung the *NX-1* onto a level keel, straightened her out, and decreased speed still more. Giving the rods of the motor and rudder controls to Graham, he moved to the small lever which would unleash his bow torpedoes, and fingered it lightly. The *NX-1* was ready for action.

Scarcely had the men reached the small control room than the familiar electric charge tingled. They stared wonderingly at each other, half afraid. No one seemed hurt. One hand on the torpedo lever, Wells watched his charts and instruments. He thanked God that there was only one of the enemy.

The ray's shock came again—and stronger. The red dot was practically upon them. The screen was still empty. Coolly, Keith slowed the submarine to a dead stop. The crimson stud came closer....

And then he saw it. It was the same fearsome, hulking form. The same curving windows, dark and lifeless.

The same knobs on its bow, one now leaping and pulsing with the paralyzing glow. At a distance of a few hundred feet the octopi ship swerved to a halt, dousing the NX-1 with its ray unceasingly. Again those two underwater craft, so oddly contrasted, were face to face. And again the weapon that had once struck the American ship's crew down at their posts was directed full onto the *NX-1*.

But it was harmless! It merely tingled, and did not paralyze! The control room sheathing held it out stoutly. The men's faces showed overwhelming relief.

Keith smiled grimly. Now, at least, he had the devils where he wanted them; now it was his turn to strike with a—to them—terrible, mysterious weapon. They had attacked; had failed—and now he could square up for Hemmy and send a pair of torpedoes into that ship of hideous tentacles.

"Port five!" The ship swerved slightly. "Hold even!" The enemy craft was very close. The *NX-1*'s bow tubes were sighted in direct line. Her torpedoes could not possibly miss. This time, destruction for the octopi

ship was inevitable....

Keith Wells gripped the lever that held the torps in leash.

"*Wait!*"

Sparks, a bare foot from him, yelled out the word. Wells, alarmed, released his grip on the knob. The radio operator was listening intently, a circle of taut faces around his crouched back. He swung excitedly around.

"For God's sake, don't fire!" he cried. "Hemingway Bowman's on that submarine! He's alive—and calling for you!"

Chapter 5: The Other Weapon

Bowman—alive!

Keith Wells let go the torpedo lever. His whole orderly plan of action was crashed in a second.—For an instant he stood gaping at the radio man, forgetful of the peril outside, striving desperately to hit on some way of surmounting this unlooked-for obstacle. The idea of firing on his friend—killing Hemmy Bowman with his own hand—paralyzed his brain.

And in that unguarded instant the octopi struck.

From the bow of the enemy submarine, slanting from another of its peculiar knobs, a narrow beam of violet light poured, cutting a vivid swathe across the televue. The huddled men stared at it, not comprehending what it was. They felt no shock of electricity, nor could they discern any other harmful effect. The ray held steadily on their bow, not varying in the slightest, for a full thirty seconds. And still none of them could feel or see any damage.

Wells, however, gradually became aware that he was bathed in perspiration, that great streams of sweat were coursing down his face. A quick glance told him that every member of the crew was the same way; and then, suddenly, he was conscious of a wave of intense heat—heat which quickly became terrific. The control room was stifling!

Before he could act, the *NX-1* slipped sharply to one side. A sharp hissing sound grew at her bow, climbing steadily to a shriek. Long streamers of white steam crept along the lower deck and seeped up into the control room. And then rose the fatal sound of rushing water—water pouring into the submarine from outside!

For the violet beam was a heat ray—a weapon surface civilizations had not yet developed. While the *NX-1*'s crew had stared at it in the televue, it had melted a hole in their bow.

Immediately the submarine lost trim, and the deck tilted ominously. In the face of material danger—danger from a source he understood—the commander

became cool and methodical.

"Sea-suits on!" he snapped. "Then forward and break out steel collision-mat and weld it in place! Every man! You, too, Sparks and McKegnie!"

"But—but, sir!" stammered Graham. "Do you want them to get us with their paralyzing ray?"

"You'd rather drown?" Wells flung back. Silenced, the first officer donned his sea-suit, and in thirty seconds the rest of the crew had theirs on and were cluttering clumsily forward.

Alone in the control room, Keith battled with the unbalancing flow of water, maneuvering with all his skill in a futile attempt to keep the *NX-1* on even keel. The men forward worked with great speed, spurred on by the realization that they were fighting death itself, but even as they labored the submarine swung in ever increasing rolls and dips; the great weight of water she had shipped slopped back and forth; her bow went steadily down. Keith swept her forward tanks clean of water, always conscious of the

immobile, staring octopi submarine in the teleview, watching them, it seemed, curiously, and not driving home their advantage with additional bolts of the violet heat ray.

Despite her commander's frantic efforts, the *NX-1* fluttered down remorselessly; the cavern floor rose, and, sinking with them, came the octopi craft, in slow mockery of a fighting plane pursuing its stricken foe to the very ground....

She struck bottom with a soft, thudding jar, and settled on even keel. At once Wells released the helm, jumped into his own sea-suit and stumbled down to take command.

He found the steel collision-mat in place, and the welding of it nearly completed. A few feathery trickles of water still seeped through on each side, but under his terse directions the pumps were soon draining it out. The weird figures of the crew in their sea-suits looked like creatures from another planet as they rapidly finished the job.

"All right—up to the control room, everybody! Fast!" Wells roared.

The men stumbled aft as rapidly as they could in their cumbersome suits. Several were already on the ladder. A few feet further—

But at that moment the paralyzing ray again stabbed into the ship—and Keith Wells slumped helplessly to the deck. And as he crumpled, he glimpsed the grotesque, falling figures of his men, and saw one come tumbling down the ladder from the control room, where he had almost reached safety....

Peculiar sensations, unendurable thoughts raced through the commander as he lay there limply. He knew his predicament. He wanted desperately to rise, to rush to the control room. Time and time again in those first few moments of impotence he strove mightily to pull his limbs back to life. But his greatest efforts were barren of result, save to leave him feeling still weaker. The fate that he had seen strike down Brown now enmeshed him. He was paralyzed. Helpless. In the midst of his crew.

After a moment all sensation left his body. His limbs might not have existed. Sensation, pain, lived only in his brain—and there it was terrible, because self-created.

He found himself sprawled flat on his back, his eyes directed stiffly upward. He could not move them, but out of the corners he vaguely sensed the other figures around him. Helpless, every one! And who knew if they would ever come out of the spell! Victory had gone to the octopi....

Minutes that seemed like hours passed. And then a well-remembered voice sounded in the radio earphones in his helmet. It was Hemmy Bowman, speaking from the enemy ship.

"Keith! Keith Wells! Are you there?" the voice cried.
"Keith! What have they done to you?"

And Keith, he could not answer! He could not answer that troubled voice of his friend—that voice from a friend he had thought dead.

Again Bowman spoke. "Keith! Can't you hear me? What are they doing to you? Oh—" For a moment it stopped, then came once more, thick with anguish. "Oh, God, what's happened?" Then lower: "If only there were light, so I could see what they're doing...." The voice tapered into silence. Keith could picture Hemmy, probably bound, giving him up for dead....

Then, quite distinctly, he heard a clank at the *NX-1's* bow! The submarine jerked, her bow tilted up—and with increasing speed she moved forward, silently as a ghost.

Keith thought he knew what that meant. The octopi ship had grasped them with another of its hawser arms, and was pulling them away. But where to? One of those mound cities? His brain was a turmoil as he tried to imagine what was before them. But all he could do was lie there and wait.

The American craft was towed for perhaps ten minutes—ten ages to her commander—then coasted slowly to a pause, and with a sharp jar settled into rest. As she did so, every light in her hull went

suddenly out.

It had been bad enough with the lights on, but the darkness was far worse. The submarine was a tomb—as silent as one, and full of men who lived and yet were dead. Hemmy Bowman's voice came no more to Wells. He was alone with his moiling doubts and fears and unanswerable questions, and he knew that every other man there was alone with them, too....

As his eyes became partially accustomed to the darkness, he could distinguish vaguely the forms of the familiar mechanisms above him. A slight noise grew suddenly and resolved itself into a prolonged scraping along the outer hull of the submarine. At intervals it paused and gave way to a series of sharp, definite taps.

Keith realized what those sounds signified: the octopi were striving to find some entrance to the *NX-1*! This, he told himself, was the end. The creatures would break through; water would rush in, and every man would drown. For the face-shields of their sea-suits were open!

The dull scrapings ran completely around the motionless submarine, punctuated with the same staccato tappings. By the movement of the sound, Wells realized the octopi were approaching the lower starboard exit port. And as they neared that port, the noise abruptly stopped.

Then for some minutes silence fell. Next, the commander heard what was unmistakably the exit port's water chamber being filled—and a moment later emptied again. The devilish creatures had solved the puzzle of the means of entrance!

In the awful darkness the inner door of the port swung open. A slow, slithering sound came to Wells' ears. He sensed, though he could not see, the presence of alien creature. An odor struck his nostrils—that of fish....

A deliberate something crawled directly across one outstretched arm, and another across his legs. And above him loomed a monstrous, complicated shadow, which, after a moment, slowly melted from his line of vision. Panicky, he strove again to bring his limbs

back to life, but still could not....

Keith knew that in the darkness which their huge unblinking eyes could penetrate they were inspecting the *NX-1*'s interior, examining the men stretched on its deck, feeling them with their cold metal-scaled tentacles. Another complicated shadow crept back over the commander's line of sight, and from all around rose the slithering, shuffling tread of the octopi's many tentacles, rasping on the steel flooring.

Sweat from Wells' forehead trickled down and stung his eyes as he lay in that dark agony. There seemed to be countless investigating tentacles feeling through the entire submarine. One of them, iron-hard, suddenly coiled under his armpit and lifted him lightly as a feather from the deck. Another snaked up and clicked his face-shield securely shut. Keith heard other clicks, and knew that the shields of his men were likewise being closed.

The commander was held straight out from the octopus' revolting body, and as he swung, helpless, he could see that more men were grasped similarly in

other mighty arms. Dangling in the shadow-filled darkness he was carried slowly to the exit port, and he heard the inner door swing open, then close again. Water streamed through the valves; it encompassed him with a feeling of lightness, a feeling of floating, as he swung at the end of the long metal-sheathed tentacles. A moment later a soft bluish glow burst on his vision, and he saw that he was outside. There was a long wait, and when the current next swung him around he was dismayed to see that every one of the monstrous creatures near him was dangling on high two or three men of his helpless crew. The whole outfit was in the power of the devil-fish!

And then their captors moved forward with them on a ghastly march of triumph....

But Keith Wells did not know that, crouched behind the instrument panel in the control room, shivering and sick with fear, was the plump form of Cook Angus McKegnie, who had just gained it just before the paralyzing ray had struck.

Chapter 6: The Monster with the Armlets of Gold

Hemingway Bowman's ardent wish, after he was whipped quickly through the round exit port of the octopi submarine, was for a quick, clean death. The horror and mystery of his situation had left him with one conscious emotion, that he was afraid. The worst had been when he was hauled through the port; when, expecting anything, he had been able to see nothing in the dark, water-filled mystery ship.

Deliberate tentacles had stroked over every inch of his body—tentacles that were not metal-scaled, as had been the arms of the creature that captured him. It was then that he guessed the true purpose of the metal suits the octopi wore—to protect their bodies against the lesser pressure near the surface of the sea. Inside the submarine they did not need them. He decided that the ship was used for rapidly transporting large numbers of the octopi to distant regions, and also for a weapon of offense and defense. The intelligence of the cuttlefish astounded him.

Keith had got away. At least he knew that, and he

thanked God for it. His bold stroke had not been in vain, his sacrifice not useless.

After the inspection of the tentacles, Hemmy had been shoved to a corner of the octopi submarine. He had felt cords wrapped around his body. After being thus secured, he was left to himself. He was utterly alone, except for strange, vague shadows that floated through the darkness—shadows that heated his brain as he realized how many of the devil-fish there were.

Hours that seemed like endless days passed.

Bowman concluded that the submarine had gone straight through the cavern and emerged finally into what seemed to be another sea. Dead silence filled the ship. What was happening, he could only guess. The craft seemed to run on forever. Never once did tentacles brush or inspect him again.

Finally the ship stopped, and a great round door opened in one wall. By the soft bluish glow that seeped in Hemmy caught a glimpse of his surroundings, and his gorge rose at the sight. The

ship was literally filled with a slowly waving forest of long black tentacles. Weird instruments, unlike anything he had ever seen, were grouped around the walls, and before them attendant octopi poised, their hideous eyes fixed and steady. There were no dividing decks as in the *NX-1*; the craft was one huge shell.

Then came furious activity. The door fell shut again, and the ship shot off at great speed. Hemmy felt sure that they were advancing to again attack the *NX-1*, and at once began to try to reach his comrades through radiophone. He knew that Wells would come back.

Finally he caught a human voice, and heard the *NX-1*'s radio operator shout to the commander that he, Bowman, was alive and calling. But when he tried to speak further, the American craft's radio was silent.

And then, in the octopi submarine, had come a soft glow of violet....

Was it a more deadly weapon than the paralyzing ray? In great suspense the prisoner waited. Silence—

silence! Horrible doubts beset his mind. Was Keith refraining from firing his torpedoes because he, Bowman, was on board the enemy boat? The thought stung him. He tried desperately again to reach Wells; but there was no answer. Were the Americans dead?

Age-long minutes passed. Then the exit port opened and several metal-clad octopi swam out. Hemmy had a glimpse of the *NX-1* lying silent and apparently lifeless on the sea-floor, a gaping hole in her bow!

As if to taunt him with the sight, the creatures left the round door open, and presently Bowman beheld the octopi open the *NX-1*'s starboard exit port and enter. Later the port swung open again, and he saw the monsters emerge, each gripping several men clad in yellow sea-suits! That they were dead, or victims of the ray, was obvious from the way they limply dangled.

The exit port closed, and darkness filled the octopi ship. Hemmy Bowman panted with the futile effort to break his bonds.

"You devils!" he yelled in blind rage, exhausted. "Why don't you take me with them? Take me! Take me, damn your stinking hides!"

When Keith Wells was taken from the silent *NX-1*, a host of astounding impressions swarmed his brain. Swinging lightly at the end of his captor's tentacle, he strove as best he could, with eyes rigidly fixed straight ahead, to grasp his new surroundings. He had, first, one flash of the octopi ship lying quite close to them, its hulk, as always, immobile and apparently lifeless. And inside it, he was sure, was his friend and first officer, Hemmy Bowman—a captive.

He saw that the octopi submarine had towed the *NX-1* into one of the weird mound cities. His own ship was lying in what seemed a kind of public square, and crowds of black octopi were swarming around it as he and his crew were brought out. Shooting straight off the square ran one of the wide streets he had previously seen from above, and on each side the brown mound-buildings rose. Their details were hazy, because of the cuttlefish inhabitants who swam thickly in front of them.

His captors started their march down this broad street. Great crowds of reddish-colored octopi clustered on each side of it; other swarms hung almost motionless—except for their constantly writhing tentacles—above, so that their line of progress was through what resembled a restless, living tunnel of repulsive black flesh, snaky arms and huge, unblinking eyes. Keith felt faint from the horror of it. Thousands of the monsters were there, all hanging in the soft, blue-glowing water; and occasionally, as he floated almost horizontally in his captor's firm grip, his legs would brush the wall of clammy flesh; or perhaps one of the tentacles would reach out as if to touch him.

The octopus that held him swam some five feet off the street bed itself; at intervals the thick swarm on either side would part for a second, and Keith could glimpse the huge mound-buildings, ever growing larger, with round entrance holes dotted all over their smooth surface, above as well as the sides.

The march was ghastly. Their captors were taking them through the heart of the water-metropolis;

displaying their human captives as did the Caesars in Roman triumphs of old!

The swarming crowds of tentacled monsters grew thicker as they progressed, and their tentacles began to whip more quickly, as if anger was burning in their loathsome bodies. Keith noted the menace of their sharp-beaked jaws, and the sickening sucker-discs on the livid under-side of the tentacles. As far as he could see, the swarms fell in behind the procession after it had passed. Following them—where?

Just as Wells felt himself on the verge of fainting, the procession turned to the right and entered the largest mound-building of all, a vast dome rising in the very center of the octopi metropolis. They continued through a corridor perhaps twenty feet high, from which at intervals other corridors branched. Held by one arm, and ever and again turning helplessly over in his horizontal transit, Keith caught glimpses of walls covered with intricate designs on a basic eight-armed motif—designs of artistic value, that gave evidence of culture and civilization.

The passage ended as suddenly as it had begun, and they came into the main body of a gigantic building.

The commander could hardly credit his eyes. The place resembled a stadium, and was so vast that he felt dwarfed to nothingness. The domed roof soared far above in misty bluish light. On the floor, exactly beneath the center of the great dome, was a raised platform, and on it a dais resembling a very wide throne. Around the dais a score or more of octopi—officials, Keith supposed—were grouped.

Rapidly the creatures following the procession swam into the chamber. Monstrously large as the place was, the floor soon was filled with the thick flood of cuttlefish which swarmed in from many doors. Keith, held with the other captives just to one side of the hole he had entered by, began to think that they must soon refuse to let any more in—when, to his surprise, he saw the latest arrivals begin to form a gallery twenty feet above those on the ground floor, and, when this was extended far back and completely filled, start yet another above it—and another, and another.... In ten minutes the mighty hall was

crowded with countless layers of the cold-eyed monsters, each layer angling up from the central dais so that all could see.

"God!" the commander thought. "Nothing but solidly-packed devil-fish all the way to the dome! A slaughter pit! And we, of course, are to be the cattle!"

Minutes passed. The throne was still empty, and the thousands in the amphitheater seemed waiting for an occupant. Keith wished he was able to close his eyes. The restless, never-ceasing weaving of the countless tentacles in the levels above made the scene a nightmare. Some waved slowly, others whipped excitedly, but never for an instant did one pause. The movements were like the never-ceasing shifting and swaying of the trunks and feet of elephants; in the dim glow the huge chamber seemed to be filled with one fantastic, million-tentacled monster that stared with its thousand eyes down on the forlorn group of puny human beings....

As if at a command the arms of the octopi on the platform suddenly began to weave in perfect unison

in some weird ceremony. First they swayed out towards the waiting captives, then they swerved slowly to the empty throne. Then came a few quick, excited whippings; and once more the long arms reached out at the small group at the entrance. This went on for some minutes. Then, very suddenly, a creature swam up from what must have been an opening in the floor onto the dais-throne.

Keith saw it well.

It was an octopus, a giant amongst octopi, and Wells knew at once it was the ruler of the realm, the lord and master of the swarming galleries and the cities of mound-buildings.

It was larger than its fellows by a full three feet. And, encircling each great tentacle just where it joined the central mass of flesh, was a broad, glittering band of polished gold—eight thick armlets that ringed the creature's revolting head-body with a circle of gleaming pagan splendor. Keith could almost fancy that a certain royal air hung over the monster.

The huge, unblinking eyes of the king stared at the horror-frozen captives. One long tentacle lifted slowly upward, and their captors at once started towards the throne with them. The score of octopi on each side stilled their weaving arms. A battery of emotionless eyes drilled into Wells' paralyzed body. He felt faint. Unquestionably the horrible ceremony was leading up to some form of cold-blooded sacrifice....

The monarch stretched a mighty arm towards Keith, and, as in a dream, he felt himself lifted out of his guard's grasp. The snakelike tentacle gripped him about the waist, and held him dangling like a puppet twenty feet in the water while the two deadly eyes stared steadily at him. He was brought closer, until the hideous central mass, with its cruel beaked jaw and ink sac hanging behind, was no more than a foot away.

Then another arm stroked slowly along the commander's helpless body. Once or twice it prodded sharply, and Wells felt a surge of fear, for his sea-suit might break. Deliberately the prying tentacle moved over him, delicately feeling his helmet, his weighted

feet, his legs.

Keith Wells grew angry. He was being inspected like a trapped monkey! He, commander of the *NX-1*, representative of one of the world's mightiest nations—prodded and stared at by this fish, this octopus! A great rage suffused him, and with a terrific effort he tried to jab his arms into one of those devilish eyes. But try as he might, his body would not respond. He could not move a finger.

For a long time the loathsome inspection continued, until the monstrous king seemed satisfied. Wells was handed back. There followed an interminable period in which nothing whatever was done, as far as he could see. He was sure that they must be talking, debating, but no sound reached his ears through the tight helmet. All the time the endless motion in the swarming levels above went on. It became hazy, dreamlike, and in spite of himself the commander began to feel drowsy. The weaving and swaying was producing a hypnotic effect. At last the desire to sleep grew overpowering.

Wells and his men were more than half unconscious when their original captors finally pulled them back from the royal presence and began a humble retreat from the throne room. Slowly they backed to the entrance. Keith's last drowsy glimpse was of a grotesque, gold-ringed monster on a throne, with a score of smaller tentacled creatures around him, and a vast haze of weaving tentacles and unblinking eyes above.

They passed from the huge chamber. The commander felt delirious, as in a nightmare, but he knew that they were again in the long corridor, and that their captors were taking them further into the mighty building, further from the street outside. He glimpsed great rooms branching off the corridor, and swarms of black octopi inside them. The light became fainter; and at last the procession turned into a separate, rough-walled chamber, dimly lit and empty.

Wells felt the grip around his arm loosen, and he floated limply to the floor among his men. He slept....

Chapter 7: The Glass Bell Jar

Keith awoke hours later.

Slowly he became conscious of a cramped, stiff body, of a dull pain racking his head. He stretched out his limbs—and, suddenly, realized he could move.

Remembering the paralyzing ray that had struck him down, and half afraid that his senses were tricking him, he kicked his left leg out. It moved with its old vigor. He quickly found that his strength had returned, that he could feel and move. The effect of the ray had worn off!

With a glow of new hope he rose to his feet and exercised numb muscles. Looking around, he saw the other men still stretched out on the floor of their rough-walled, watery prison. He called into his radiophone mouthpiece:

"Graham! Graham, wake up!" A grotesque figure stirred among its fellows; turned over. "It's Wells, Graham," Keith continued. "Get up; you can, now!"

And he watched the form of his big first officer stretch out and finally rise, while stupid, sleepy sounds came to his radio receiver.

"Why—why; the paralysis is gone!" Graham said at length.

"Yes, but maybe the octopi don't know it. Rouse the other men at once, and we'll see what we can do."

It was weird, the sight of the lifeless figures of the men stirring to life in the dim-lit water as Graham shook each one's shoulder. The radiophones buzzed and clicked with their excited comments and ejaculations. Keith felt much better. With his men restored to strength, and clustered in a determined, hard-fighting mass, he saw a hope of breaking out and regaining the *NX-1*.

He let them exercise as he had for some minutes, then proceeded to a brisk roll-call. There should be fifteen men and two officers. Rapidly Graham ran over the names, and each time a voice rang back in reply—until he came to the cook.

"McKegnie?... Cook McKegnie?"

There was no answer. Wells stared around the group of dim figures and himself called the name again. But McKegnie was not present. And as the commander and his men realized it the numbing spell of their desperate position settled down on them again like a shroud.

Keith shook off the mood. "Well," he muttered, "I guess the devils got him. Poor McKegnie's seen the wheels go round for the last time.... All right: take command, Graham. I'm going to do a little reconnoitering."

The round entrance hole was some fifteen feet from him, at the far end of the cell. Keith advanced cautiously to it, the peculiar light feeling the water gave him making his steps uncertain. The dim blue illumination made the details of the corridor outside hazy, shadowy, but it seemed to be empty. Peering out, Wells could sight no guarding octopi. He edged closer and stared down to the left. Twenty feet away the vague light tapered into darker gloom, filled with

thick, wavering shadows; but it was apparently devoid of tentacles. He wondered if the octopi were unaware that the effects of their ray had worn off, and peeped cautiously around the edge to the right.

Immediately a long arm whipped out, grasped him around the waist and flung him twisting and turning back into the chamber. Graham laboriously made his way to the commander and helped him to his feet. "Hurt, sir?" he asked anxiously.

"No," Keith gasped. "But that devil—"

He stopped short. The first officer turned and followed his commander's stare.

The entrance hole of the cell had filled with a monstrous shape. A huge octopus was resting there, its unblinking eyes coldly surveying the crew of the *NX-1*. On each of its thick tentacles was a broad band of polished gold. It was the king, the same creature that had inspected them from the throne-dais a few hours before. And behind him in the corridor the men glimpsed another octopus.

Slowly the ruler of the octopi swam into the chamber. Its great eyes centered icily on Keith Wells, standing at the head of his cowering men; and its mighty tentacles waved slowly, gracefully, as if the creature stood in doubt. One of them tentatively reached out and hovered over their heads, moving uncertainly back and forth. Then, like a monstrous water snake, the tentacle poised, flicked out and plucked a man from his comrades.

His shriek of terror rasped in their earphones.

"Steady, men!" Keith cried. "It's hopeless to try and fight them! The monster just wants to look him over!"

The man—Williams, a petty officer—was dangled by the armpit in mid-water and made to slowly revolve. The tip of another huge arm snaked out and for some seconds stroked his body, probing curiously. He panted with fright, and in their earphones his friends could hear his every tortured exhalation. Anxiously, Keith watched. Then, without warning, another tentacle darted up, fastened its tip on the breast of the captive's sea-suit, and deliberately ripped it open.

The doomed man's last scream rang in their helmets as the water poured into his suit. They saw him writhe and struggle desperately in the remorseless grip which held him. The two huge eyes of the cuttlefish surveyed his death throes minutely; watched his agonized struggles gradually weaken; watched his legs and arms relax, his head sink lower.... And then the tentacle let a lifeless body float to the floor.

Jennerby, a huge engineer, went completely mad. "I'll get him, the devil!" he yelled, and before Keith could command him to stay back, had flung himself onto the giant king.

Death came as a mere matter of course. Without apparent effort, the monarch ripped off Jennerby's helmet and sent him spinning back. The man's body writhed and shuddered, and in a moment another stark white face showed where death had struck....

Trembling, sick at heart, the commander yet had to think of his men. "For God's sake," he cautioned them, "keep back. Don't try to fight now; we've got to wait

our chance! Steady. Steady...."

The king's deliberate tentacle again began its slow weaving. It was choosing another victim. And this time it darted straight out at Keith Wells and gripped him with a mighty clutch about the waist.

The commander did not cry out. As he was brought close to the staring eyes, and felt their sinister gaze run over him, it flashed through him for some obscure reason that the monster knew him for what he was, the leader, from the tiny bars on each shoulder of his sea-suit.... He waited for the tentacles to rip it open.

But they did not. Instead, the creature turned and swiftly swam with him out through the entrance hole.

They went to the left in the corridor, further into the heart of the building. The bluish light became stronger. As Keith twisted in the giant monarch's grip he glimpsed the other octopus following with the two dead men. He saved his strength knowing it was hopeless just then to try and struggle free.

Quick as was his passage, he noticed that the walls of the corridor were covered with intricate designs, in bas-relief, and colored. He passed row after row of mural paintings of octopi in various activities, and guessed that they represented the race's history. One was obviously a scene of battle, with a tentacled army locked in combat with another strange horde of fishlike creatures; a second showed the construction of the queer mound-buildings on the sea-floor, with scores of monsters hauling great chunks of material into place, and another pictured the huge audience chamber, with a gold-banded king motionless on his throne.

As the king drew him rapidly along, he had a glimpse through a circular doorway of a large room, inside which were clustered the black shapes of thousands of baby octopi, tended by what were evidently nurses. Other such rooms were passed, and the young commander's brain whirled as he tried to measure the size and progress of this undersea civilization. Perhaps the race of octopi was growing, reaching out; needed new room to colonize. That would explain why

their submarine had been sent through the tunnel....

A voice sounded in his ears:

"Keith? Are you all right?" It was Graham, calling from the cell behind.

"So far," Wells assured him. "I'll keep in touch, and let you know what happens."

At that moment, his captor carried him into a large chamber at the end of the corridor. He looked around, and decided it was a laboratory. He beheld strange instruments, anatomical charts of octopi on the walls and, in one corner, a small jar of glass, in which a dull flame was burning. Many-shaped keen-bladed knives lay on various low tables, and thin, wicked-looking prongs and pincers.

"I'm in their experimental laboratory, Graham," Wells spoke into the mouthpiece of his tiny radio. And then his roving eyes saw something that made him audibly gasp.

"What's the matter, Keith?" came the first officer's anxious voice.

After a moment the commander answered. "It's—it's a pile of human bodies. The bodies of those fishermen. They—they've been experimenting on them...."

Was he, too, Wells wondered, to be experimented on? The sight of that stacked pile of bodies chilled him with horror. He kept his eyes from them, till the octopus with the golden bands swung him through a hinged door in the farther wall.

He found himself in a side room, smaller than the outer chamber, the whole center of which was occupied by a huge glass bell jar, some thirty feet in diameter. Inside it was much strange-looking apparatus on tables, and trays of operating instruments—knives like those in the outer room, and the same thin prongs. The great jar was empty of water, and on one side was an entrance port.

The king tossed Keith into a corner and quickly donned a metal-scaled water-suit. When he had it all

on, and the glass body-container fastened into place, he picked up his captive again and advanced through the bell jar's entrance port into a small water chamber. A moment later Wells felt his body grow heavy as the water of the compartment ran out, and then there was a click and he found himself inside the jar, still held in the merciless grip of a tentacle.

He twisted around to find the cold eyes of the octopus staring at him only a foot away. And as he wondered what was going to happen next, the king unfastened the glass face-shield of the commander's sea-suit with a quick flip of the tip of a tentacle.

Keith's arms were pinned to his sides; he could not move to try to refasten the face-shield. Fearful, he held his breath; held it until his face was purple and his lungs were near to bursting. But at last the limit was reached, and with a great wrench he sucked in a full breath.

It was clean, fresh air!

The air was like a breath of his own world brought

down to this cold realm of octopi. Once he had caught up with his breathing it poured new life into his limbs, jaded from the artificial air of the sea-suit. Keith felt his muscles respond, felt his whole body glow with new strength and life. Twelve inches away the king was watching his every reaction closely through the huge helmet of glass. The thought passed through the commander's mind that he was not only king, but chief scientist of this strange water civilization.

Then, while his lungs swallowed hungrily the good, fresh air, several tentacles began to feel around him in an attempt to unfasten the rest of his sea-suit.

Wells blanched at the sudden realization of how helpless he would be if the suit were taken from him. He would then not only be a prisoner of the octopi, but a prisoner of the glass jar, unable ever to leave it, and more than ever at the mercy of his captor's least whim. Not that he had any delusion that he would live long in any case: it was just the simple strong instinct of self-preservation that made him grab at every chance for life.

This thought flashed through his mind, even while the octopus was fumbling with the catches of his suit. And along with it was born a desperate plan of escape. He was in his own element, air; the octopus out of his. If he could crack the glass of the king's helmet, and let the water out and air in!... The glass was only twelve inches away.

The commander stopped his resistance, and at the same time felt about with his legs until he had them well braced against a lower tentacle. He pushed gently, and came a few inches nearer the glass; a little more. Then, with a quick, strong jerk of his body he crashed the steel frame of his helmet square against the cuttlefish's sheathing of glass.

The creature was taken wholly by surprise. Tentacles whipped out to tear the rash human quickly away—but not before Keith had pounded again, and heard the splinter of smashed glass! He had jabbed a hole in the glass body-piece, and already the life-giving water was pouring out!

Panic seized the king, and he became a nightmare of

tortured tentacles. Wells was flung wildly away and fetched up against the side of the jar with a crash that for a second stunned him. More and more water poured from the octopus' suit, and air at once rushed in to take its place. The creature's great eyes became filmy, while the revolting spidery body slewed here and there across the jar, all the time whipping and thrashing at the strangling air. Keith scurried from side to side, trying to keep out of reach of the crazy, writhing tentacles. Once a glancing blow knocked him flat, but the monster was altogether unconscious of him and he got away.

Little by little the terrific whipping and coiling of the tentacles quieted down. The drowning king lay in one place now; its loathsome red body, no longer protected by glass, turned bluish. Keith thrilled with elation at his victory.

And then, for the first time, he noticed that there was a full three inches of water on the floor—far too much to spill from the king's suit. A quick look around showed him where it came from. There was a long crack in the side of the glass jar, at the place where

he had been crashed against it—and water was pouring in!

Keith flung himself against the crack, jammed his arm into the broadest part of the leak. But still the water rushed in. The octopus was in its death throes, weakening steadily—but just as steadily the water poured in and rose up the sides of its body. In a flash Wells saw that the liquid would win the race to cover it and allow the monster to resume breathing.

"Oh, damn it!" he cursed fervently. "Now I've got to run for it!"

He stumbled to the port, snapping shut his face-shield as he went. In a moment he had solved the working of the mechanism and was in the water chamber, then outside in the room itself. Fortunately his sea-suit was unhurt. He thanked heaven for that as he tore away a boardlike piece of apparatus and jammed it over the leak in the jar.

Keith paused a moment to plan. The king of the octopi was still writhing in ever weakening struggles, but

the water was halfway up his body. "It'll cover him soon," thought the commander, "and then it's a question how long it'll take him to come to. I've got to move fast—slip out into the corridor and run the gauntlet back to the men." His eyes rested on a large knife, and he appropriated it, since he saw nothing else he might use.

For the first time since the beginning of the fight he answered the questions and exclamations that had constantly sounded in his ears from the distant crew. Tersely he told them what had happened, and of the gauntlet he had to run.

"Make ready for a dash to the *NX-1*," he finished. "It's now or never. Wait three minutes for me, and if I don't make it, go ahead anyway. Remember—three minutes. This is an order. So long, fellows!"

He shut his ears to the bedlam of comment that followed. His knife ready, he took a few steps to the door and pushed out—right into the tentacles of a waiting octopus.

His knife was useless. While locked motionless by three arms of his captor, another streaked out and wrenched it from his hand. Once again Keith was absolutely helpless.

Great confusion resulted in the laboratory. The commander heard no sound, but the guard must have called, for five more octopi darted rapidly out of an adjoining room. Their tentacles writhing in great excitement, they swam past and into the inner chamber to the rescue of their nearly drowned king.

The devil-fish that held Wells almost crushed him to death in its excitement. It was obviously undecided what to do; but finally it sped him down the passageway and cast him back inside the cell with his men. Then it quickly retreated.

The commander staggered to his feet and faced Graham and the others. "A miracle!" he gasped; "I'll tell you later. But now we've got to make our break. The king's out, and we've got to get away before they bring him to. There's nothing to do but rush the door. It means sure death for half of us, and probably for all

—but God help us if the king catches us!"

He paused and surveyed them keenly. "Everybody with me?" he asked. And not one man held back his answer.

Wells smiled a little. "Good!" he said.

There were twelve men and two officers. There were thousands of octopi. On the face of it, their chances seemed hopeless. Not for a second did Keith count on getting many men to the *NX-1*. But he knew where the submarine was, and he had to try.

Tersely he gave them final instructions.

"This corridor leads to the main entrance. That is, to the right—understand? Then straight down the street outside, to the left, is the square where they towed the *NX-1*. I'd say it was a hundred yards.

"There's one guard outside. Graham, you and half the men to the right of the door. I'll take the rest to the left. Our only chance is to try and destroy the octopus'

eyes."

His mind cast about desperately for some form of weapon. The only detachable thing on their sea-suits was the small helmet-light, a thing, Keith told himself, without possible offensive use. Still, the beams would enable them to more clearly see their path and keep together, so he ordered them in hand.

The men were grouped and alert. The moment had come.

"Remember," he said, "—its eyes. Then stick together and run like hell. All right—good luck—and let's go!"

Awkwardly, stumbling clumsily in the retarding water, the small group surged through the door. Immediately a black shape pounced upon them from the clustered shadows—the guarding octopus.

Its tentacles seemed to be everywhere. In seconds five men were clutched in its awful grip, their fists rising and falling impotently as the hideous arms constricted and crushed them inward. Keith, free of

the clasp, yelled: "The eyes! The eyes! Put out its eyes!"

For answer, a yellow arm clutching a helmet-light broke through the grotesquely milling mass and struck at the cuttlefish's great pools of eyes. It missed, but the switch flicked on, and there stabbed through the gloom a broad, glaringly white ray.

Its effect was astounding. The beam smote the octopus squarely in its huge eyes, and immediately the creature shuddered; writhed with pain. The tentacles released the men—and the monster fled back into the protecting shadows!

A shout from the men roared in the commander's earphones. "They can't stand the light!" he cried. "Thank God! Beams on, everyone! Flash 'em in their eyes! Forward!"

Fourteen shafts of eye-dazzling light forked through the corridor. The tiny company, beating their path with criss-crossing shafts of white, forged ahead. They thrashed the shadows with their beams, probing

each inch of water—clearing their way even as a tank hoses machine-gun bullets before its clumsy body. Their former slender chance grew; they filled with hope.

Another swarm of devil-fish, long arms whipping before them, raced from branching corridors and bore down on the company of humans. The men were ready, and fourteen tongues of white met them squarely. They faltered; the weight of their fellows behind shoved them on; but the rays steadied, and the front row of octopi broke in panic. The others at once followed in wild retreat.

"Keep together, men!" Keith ordered sharply. "One beam to each octopus—straight in its eyes till it retreats! Forward!"

They pressed on. The octopi, with eyes used only to the soft blue glow of the cavern, could not stand against the brilliant rays. Keith leading, the *NX-1's* crew stumbled out into the street.

They faltered a moment when they saw each entrance

hole of the mound-buildings shooting out streams of octopi. Hundreds were in sight already. The whole city was evidently alarmed. Wells at once formed his men in a circle, so their beams would guard them on every side and above. Apparently the octopi could not approach within thirty feet of them, and even at that distance they turned and fled, writhing with pain, whenever a shaft of light struck full in their eyes.

"The square's just ahead!" the commander roared. "One last rush, now, and we'll reach the submarine! Stick close; keep your arms locked; and watch out above!"

The circle of men narrowed. The rays gave their tiny cluster the appearance of a monster even more fantastic than those moiling around them—a monster with long straight tentacles of glaring white. They stumbled forward through the magically parting ranks of black octopi. The beams kept the creatures back; they were helpless before them.

Foot by foot under the inverted bowl of threshing tentacles the *NX-1*'s crew lumbered ahead. The street

at last ceased; the wide square opened before them.

"We're here!" Wells yelled exultantly. "This is the—"

His voice fell into abrupt silence. He stared around the square, and his heart went cold indeed. They had reached the right place, but it was empty.

The *NX-1* was not there!

Chapter 8: Cook, the Navigator

Through all these hours, one man had remained on the *NX-1*, and that man was, to put it mildly, scared to death.

Cook Angus McKegnie had been nearest the connecting ladder when Keith Wells roared out the command to retreat above, and his desire to regain a place of safety was so earnest that he made the control room in record time. At once he had felt the tingle of the paralyzing ray. Struck by a horrible thought, he ventured to peer down the ladder—and groaned to see the figures of his comrades, all lying limply on the deck. His portly frame quivered like jelly as realization came to him that he was the only one who had escaped the ray.

Heroic ideas of saving the submarine, of rescuing the men below, flashed wildly through his head. But only for a moment. On second thought, he felt he ought to hide. So, in the tomblike silence that had fallen, the two-hundred-and-twenty-pound McKegnie wormed a way behind an instrument panel, effecting the journey

by vigorous shoves of his stomach. It was minutes later that he first noticed that some sharp jutting object was jutting deep into his ample paunch, but he could do nothing to remedy it. He was hidden, anyway, and he was going to stay hidden!

The cook felt the *NX-1* being towed forward. Then, after a dreadful wait, he heard queer noises down below, and was positive the exit ports had opened. The snakelike slithering and shuffling which followed would mean that the enemy was inside the *NX-1*. The thought brought St. Vitus' dance to his limbs, and, try as he might, he couldn't still them. Then again the ports opened, the gloomy silence returned, and Angus McKegnie was alone with his reflections.

After the first hour he gave voice to them in one simple, bitter sentence. "Just why the hell," he muttered, "did I ever join the Navy?" The silence offered no reply, and McKegnie, desperate from his cramped position, ventured to poke his head around the instrument panel. The faint emergency lights showed the control room to be empty. He decided to come out, and did so, worming his way back with

great difficulty.

Once out, the first thing his eyes fell on was the televue screen. Now the cook had never seen one of the octopi, and the screen showed hundreds of monsters clustering around the *NX-1*. So with unusual promptness he acted, jamming himself once again into his hiding place. Maybe, he thought, they had some way in which they could see into the control room and discover him!

Hours passed. The cook was sopping with sweat. Finally his thoughts emerged into words.

"I got to get out of here!" he said intensely. "I *got* to! And I got to run this submarine!"

The sound of his voice somehow emboldened him. Once more he backed out of his cranny, and with cautious, trembling steps explored the control room. He kept his eyes from the televue, though it had a terrible fascination for him, and surveyed the *NX-1's* array of control instruments. The prospective navigator groaned at the sight.

There were dozens of mysterious wheels, jutting from every possible angle, squads of black and red-handled levers, whole armies of queer little stud-buttons and dials. His knowledge of cooking helped him not at all in the presence of that maze of devices. Timidly he touched one of the levers, but immediately snatched his hand away as if afraid it would bite. His boldly announced purpose of running the craft went glimmering.

An accidental glimpse of the monsters in the televue suddenly decided him that he needed a weapon. He hunted frantically through the lockers and found three service revolvers, which he fastened at his waist, adding his own carving knife to the arsenal. But he didn't feel much better. Then, remembering for the first time his sea-suit radio, he yelled: "Mr. Wells! Mr. Wells! Oh, Mr. Wells, where are you? Can you hear me?" There was, of course, no answer.

He tried to bring his muddled thoughts and fears to order. "I got to run this thing," he said doggedly. "*Got* to! Now, let's see: what the hell's this thing for?... What the—"

He broke off short, and his eyes went wide. He had heard a noise!

Yes—there it was again! The same peculiar scraping at one of the exit ports! He glanced fearfully at the televue. "Oh, Lord!" he yelled. "They're comin' in to get me!"

He started to dive back behind the instrument panel, but stopped, drew two guns, and in an agonized muddle trotted back and forth for a moment, waving them. Another look at the screen showed that an exit port was open, admitting two metal-scaled octopi. McKegnie couldn't stand it any longer: he wedged himself behind his panel again. Soon sounds of the metal tentacles on the deck below told him that one of the creatures was coming up the ramp—then slithering into the control room itself. The cook was a lather of cold perspiration.

For a few minutes there was silence. The octopus was apparently surveying this new part of the submarine. Then, without warning, the tip of a metal-scaled tentacle felt around the panel and crept, exploring, up

Angus McKegnie's leg—which leg was again suddenly afflicted with St. Vitus' dance. The tentacles coiled, pulled hard—and the cook with a yowl was yanked out into the room.

Dangling upside down, high in the air, he submitted to the fishy stare of the great eyes under the sheathing of glass. But soon he started to squirm, and his violent contortions brought a rush of blood to his head, making him quite dizzy. It was while he was in that state that things started to happen.

First, a great roar rolled through the *NX-1*, and McKegnie found himself flat on the floor with his breath knocked out. Then, while this was registering on his mind, he discovered himself the center of a madly milling set of tentacles, and instinctively scrambled out of the way. From a distance he saw that the tentacles belonged to the octopus that had held him, and that their coilings and threshings were gradually dying down, until only a quiver ran through them from time to time. While McKegnie was trying to figure this all out he noticed that the monster's glass sheeting was shattered, that it lay in a pool of

water, and that the odor of burnt powder was in the air. Looking down he found that he had a gun in his hand. A thin wisp of smoke was curling from the barrel.

"Gee whiz!" he ejaculated. "Gee *whiz*!"

As he stood there recovering from his surprise, he heard the other octopus crawling up the connecting ramp, coming to see what had befallen its fellow. Preceded by two trembling guns, McKegnie tiptoed to the ramp and peered down.

From the darkness he saw another complicated mass of metal tentacles and glass advancing up towards him. Fear smote the cook, and almost without volition he pointed his guns and pulled the triggers. As before, a bullet crashed into the great dome of glass, and he watched a short but terrible death struggle. He had, by himself, slain two octopi!

A tremendous elation filled McKegnie—until it occurred to him that his shots might have been heard outside. At once he ran and looked at the televue

view screen, and what he saw on its silver surface took all the triumph abruptly out of him. The octopi outside were darting about with alarming activity; a whole cluster of them was centered at the exit port, and, even as the cook stared, the preliminary sounds of opening it came to his ears.

"Now I *got* to run this ship!" he groaned.

He peered at the mass of levers and wheels, put out a hand, closed his eyes, hesitated, and pulled one of them back. Nothing happened.

He tried another. The noise below grew, but still the *NX-1* remained motionless. Desperate, the cook jerked several other levers. The whine of electric motors surged through the silence; the submarine shuddered and slewed off to the right, as if trying to dig into the sea-floor.

"I got it started!" he cried. He did something else. The *NX-1* stuck her bow dizzily up and sped into the misty-blue realm above in a grand, sweeping circle. The sea-floor with its mound-buildings and swarming

octopi fell away behind with a rush.

"There!" muttered the triumphant cook. "But—how did I do it?"

The submarine was rising like a sky-rocket. McKegnie remembered suddenly that Wells had said the cavern was only a few miles high; he must now be very near the top. He held his breath while he pushed a likely looking lever the other way.

He was lucky. The *NX-1* capered like a two-year-old, kicked up her stern and bolted eagerly for the depths once more. Again the floor of the cavern rushed up at him, again he pulled the potent lever back, and again the submarine meteored upward.

This procedure went on for some time. McKegnie was only running an elevator. Was he doomed to dash up and down between floor and ceiling forever? He gave forth pints of sweat, now and then groaning as the submarine grazed horribly close to top or bottom. The dead octopus at his feet slithered limply around on the crazy-angling deck.

"I can't keep this up forever!" the cook said peevishly.
"Now, what the hell's this thing for?"

He turned it, and the *NX-1* tilted in one of her dives and raced forward, midway between ceiling and floor. Her navigator relaxed slightly. He had found the major controls; at least he had been able to stop his dizzy game of plunging up and down. Then, just as he was beginning to wonder where he could go, a large red spot glowed at the edge of the location chart.

"Oh, Lord!" he cried. "That's the other submarine—an' it's comin' after me!"

Evidently it was, for the red spot rapidly approached the green one. The paralyzing ray tingled, and a moment later the enemy's huge bulk loomed on the televue screen, a band of violet light spearing from one of her jutting knobs.

Frantically McKegnie juggled his levers, and then it was that the *NX-1* really showed what was in her. She emulated, on a grand scale, a bucking bronco: she stood almost on her nose, and threatened to describe

somersaults; she tried it the other way, on her stern; she rolled dizzily; she all but looped the loop, and went staggering around the cavern in great erratic bounds that must have made the octopi think she was in the hands of a mad-man—which she practically was. Her designer would have had heart failure.

In the televue screen the frantic McKegnie would see the octopi submarine rush erratically by with a flash of its violet heat ray; the location chart showed the red spot zigzagging drunkenly around the green one. Each boat made occasional short, crazy darts at the other; sometimes they would stand approximately still. It was a riotous game of tag, and McKegnie knew too well that he was "it."

During one brief pause the anguished cook found himself groaning aloud: "Oh, Mr. Wells, where are you? I can't keep this up! I can't! I can't!"

There were still several important-looking controls that were mysteries to him. But what if he should pull one and open all the exit ports? He shuddered at the thought.

Things had become nightmarish. The ship was pitted scores of places by the heat ray. The control room had grown stifling. McKegnie was losing pounds of flesh, and literally stood in a pool of his own perspiration. The octopi craft kept doggedly after the *NX-1*, no matter how often and effectually the sweating cook's reckless hands prevented her getting the heat ray home.

For a long time the two ships continued to race up and down. The *NX-1* would plunge, pirouette around the other, and scamper away towards the ceiling as if enjoying it all hugely, abruptly to forsake her course and come zooming down once more. She would weave in romping circles and seem to go utterly crazy as her jumbled navigator pulled his levers and turned his wheels in a frantic effort to get somewhere.

To get somewhere! Yes—but where?

"Oh, Mr. Wells, where are you?" the harried cook would bleat at intervals.

Or, plaintively: "Now, what the hell's *this* thing for?"

Chapter 9: At Bay

Fourteen humans stood at bay on the cold sea-floor, dazed by the ruthless stroke of ill-luck which had taken the *NX-1* from where they had left it.

"It's gone," whispered Graham over and over in a hopeless tone. Keith tried to pull himself together. He had to think of his men.

In a second, his whole plan, which had seemed to be approaching success so rapidly, was smashed by the disappearance of the submarine. Mechanically he kept his helmet-light playing into the ever-thickening eyes and tentacles around him, while he scanned the sea-floor nearby. It was filling more closely than ever with the black, writhing forms of the cuttlefish. The rays still held them back, but their great bulk loomed over the small party of humans like a sinister storm cloud. Soon, in their overwhelming mass, they would crush down, and the submarine's crew be conquered by sheer force of numbers.

"Look!" Keith cried. "There's where she was lying!"

He pointed out on the floor of the square a deep groove, obviously made by the hull of the *NX-1*. Its length and jaggedness seemed to denote that the submarine had tried to bore into the bed of the cavern itself. Wells was mystified. If the octopi-ship had towed her away, she would certainly not have gouged that deep scar on the sea bottom....

But he dismissed the strange disappearance from his mind. He had to work out a plan of action.

"Keep together, men, and follow that scar!" he ordered tersely. "There's a chance that the *NX-1*'s somewhere further along!"

It was a futile hope, he knew—but there was nothing else. The tiny group, centered in the inverted bowl of black, writhing tentacles, lumbered onward.

Then the octopi struck with another weapon, in an effort to dull the spearing beams of white. Here and there from the mass of black an even blacker cloud began to emerge. It quickly settled over the whole scene, pervading it with a pitchy, clinging darkness

that obscured each man from his neighbor.

"Ink!" cried one of them. It was sepia from the cuttlefish's ink sacs—the weapon with which these monsters of the underseas blind and confuse their victims.

"Faster!" the commander roared in answer. "And for heaven's sake, keep together!"

They huddled closer. Under the protecting cloud of ink the mass of octopi pressed nearer. The struggle became fantastic, unreal, as the brilliant beams of white bored through the utter blackness searching for eyes which the men knew were there, yet could not see until their rays chanced upon them. Snaky shadows milled horribly close to the little group of bulging yellow figures. Blacker and blacker grew the water; they could not always see the monsters as they drove them back on each side. Now and then a bold tentacle actually touched one of them for a moment before its owner was thrust, blinded, away.

Suddenly the dark cloud cleared a little as the fight

moved into an unseen current. Their range of vision lengthened to ten or twelve feet; they could dimly sense the looming mass of cuttlefish: and it was less often that one of the monsters darted forward, daring the rays of white, and became altogether visible. When this did happen, half a dozen dazzling beams converged on the octopus' eyes and drove it back in writhing agony.

The men were the hub of a grotesque cartwheel, whose spokes were inter-crossing rays of white. They still forged onward along the groove, but moved more slowly now, and Keith Wells, tired to death, realized the combat could not go on much longer. Their advance was useless; a mere jest. The *NX-1* had vanished. It would only be a question of time before their batteries gave out, or the swarms of octopi crushed in on the struggling crew. Their overwhelming numbers would tell in the end.... The men were silent, except for the occasional gasps which came from their laboring lungs.

And then the king of the octopi appeared.

Keith had been wondering, in the aching turmoil that was his brain, where the gold-banded monarch was. He knew the monster had been rescued, and he dreaded coming face to face once more with that huge form. Now, armlets of glittering yellow suddenly flashed in the thick of the besieging tentacles, and two great evil eyes glared for a second at Keith Wells. The commander flung a burst of light at them and laughed crazily as the monster scurried back. For a few moments the king was not visible.

"Well, fellows," Wells said, "it won't be long now. His Majesty's back on the field." He grinned a little through his weary face. "I wonder what he'll hatch up to combat our helmet-lights? Watch close: he's damn clever!"

The commander did not have long to wonder. The vague wall of tentacles began retreating deeper into the ink. Keith could not imagine the reason for it, but held himself taut and ready. His men, likewise noting the move, unconsciously grouped closer, waiting tensely for they knew not what.

The king of the octopi had indeed hatched a plan of attack. After a moment the mass of creatures again became slowly visible, but this time when the rays shot out they did not hold them back. Could not—for their eyes were not visible.

"My God!" Wells cried. "They're coming backwards!"

It was so. The octopi—no doubt under their ruler's orders—had turned themselves around, and now, with eyes directly away from the dazzling shafts of white, were closing slowly in on the humans from all sides. The helmet-lights were useless. They could not reach the creatures' eyes.

Tentacles coiling, whipping, interweaving, the wall of flesh pressed in. Death stared the helpless crew of the *NX-1* in the face. First Officer Graham shrugged his shoulders and said tiredly:

"Well, I guess it's all over.... Unless," he added with a feeble smile, "somebody figures a way to melt us through the sea-floor...."

Keith Wells' face suddenly lit up with an idea. He swung around and roared:

"The hell it's over! We can go *up*!"

His crew understood at once. "What fools we—" Graham began, but Keith cut him short.

"Listen," he rapped quickly. "Jam together in one bunch and lock arms tight. When I give the word, flood your suits with air. We'll go up like comets; crash right through the devils.... Hurry!... All ready?"

He saw that they were. "Then, together—go!" he commanded.

As one man the crew adjusted their air-controls, bulging the sea-suits with air. Their weighted feet left the cavern floor at once, and, locked tightly together, the whole fourteen of them shot like a bullet to the living ceiling of unsuspecting cuttlefish above.

They hit with a terrific crash. Keith was momentarily stunned by the force of impact. He felt himself torn

away from his men, felt a dozen tentacles snake over him, and mechanically stabbed out with his helmet-light. For a moment he was held; then the air and his light pulled him through, and he broke out through the top.

In his rocketing upward progress the extra oxygen rapidly cleared his mind. Glancing below he saw a great, dark, many-fingered cloud dropping rapidly away, and was glad to know that the octopi could not follow him into the lesser pressures above without their suits. Over the dark cloud he glimpsed a few scattered pin-points of light—the helmet-beams of the other men. They were rising as swiftly as he.

"Thank God!" he murmured reverently. "We broke through! We broke through!"

Chapter 10: The Return of the Wanderer

Wells watched the several helmet-lights shooting upwards and wondered if they represented all the men that had got safely through the net of tentacles. Remembering the rocky ceiling they were rapidly approaching, he ordered the others to reduce speed by discharging air from their sea-suits. He received no articulate answer.

Although he cut down the rush of his own progress, it was with a jar that he bounded into the top of the cavern. As he dangled there, he beheld four light beams hurtling upward; his earphones registered crash after crash: and then he saw the beams go spinning down into the gloom again, weaving and crossing fantastically, the shock having jerked them from their owner's hands. Keith had lost his own helmet-light below, but peering around he could make out a few vague forms, bumping and twisting in the current.

"Graham!" the commander called. "Graham, you there?" After a moment his first officer's voice came

thickly back.

"Yes—here. A bit groggy. That crash...." Wells swam clumsily towards him.

"I guess only a few of us broke through," the commander said slowly. As the two officers hung at the roof, swinging grotesquely, one by one the other men came to their senses and reported their presence in the radiophone. Keith ordered them to cluster around him, and soon eight weird figures had grouped nearby. After a while they located two others, which brought their total to ten men and two officers. They looked a long time, but could not find any more. Two were gone.

Deep silence fell over the tiny group. The dark mass of the rocky ceiling scraped their helmets; below, the bluish waters tapered into a thick gloom, hiding, miles beneath, the mound-buildings and swarming octopi.

One of the men spoke. His words were audible to everyone, and they voiced the thought in every brain:

"What're we going to do now?"

Keith had no answer. They had escaped the immediate danger, but it was only a temporary respite. The commander knew it was hopeless to try and locate the tunnel leading to the outer sea, for they were very tired, and in their clumsy suits they would be able to swim only a few rods. Their helmet-lights were gone; they had played their last card.

"They're goin' to find us after a while," the pessimistic voice continued. "They'll send that submarine of theirs after us—or maybe they'll come up in their metal suits...."

"Well," Keith replied with forced cheerfulness, "then we'll have to fight 'em off."

"Why not rip our suits an' end it now—" began another, but Graham's voice cut in sharply.

"Quiet!" he said. "I heard something!"

The men stilled abruptly. In tense silence their ears

strained at the headphones. Wells asked: "What did you hear?"

"Wait!" Graham interrupted, listening intently. "There it is again! Listen! Can't you hear it? Why, it sounded like—like—"

Keith concentrated his whole mind on listening, but could catch nothing at all. He was just about to give up when he caught a faint, jumbled murmur—the murmur of a human voice.

"My God!" he whispered. The voice, little by little, grew, and Wells could distinguish words. They formed into a complete sentence. Keith heard it plainly. It was:

"Now, what the hell's this thing for?"

Unmistakably, it was the voice of Cook Angus McKegnie, whom they all had thought dead.

Amazed, the men of the crew started to jabber.

"Quiet!" Wells ordered sharply. He listened again.

McKegnie's voice was growing quickly and steadily louder.

"McKegnie!" the commander cried excitedly.

"McKegnie, can you hear me?" There was no answer. Patiently Wells waited a minute, every second of which increased the volume of his long-lost cook's bewildered tones. Again he tried.

"McKegnie! Can you hear me? This is Commander Wells. McKegnie!"

The cook's stammering voice came back:

"Why—why—is that you, Mr. Wells? Did I hear you, Mr. Wells?"

"Yes!" Keith shouted impatiently. "This is Commander Wells! For heaven's sake, McKegnie, where are you?"

"I don't know, sir!" the cook responded. "Where are you?"

Keith was for the moment perplexed. "But—but, are

you a prisoner?" he questioned. And he could have sworn he heard a distinct note of pride as the invisible McKegnie replied: "Oh, no, sir! Not yet! These devils been tryin' their best to get me, but they couldn't! No, sir!"

Wells became more and more puzzled. "Then—but—you're not running the *NX-1*, are you?"

McKegnie's voice was much louder now, and growing every second. The note of pride persisted. "Of course, sir!" he confirmed. "It was kind of hard at first, with these octopises botherin' me, but I got onto it pretty quick. That octopis ship chased me with them heat rays for a long time, but I ain't seen them lately. I guess I kinda tired them out."

His last words grew louder with a rush, and from the dark depths beneath a long shape suddenly appeared, hurtling up at the group of astounded men in a zoom that bade fair to take it straight through the ceiling. It was the *NX-1*.

"Dive, man, dive!" Keith yelled. "Cook, pull that black-

handled lever towards you! Yank it back! Yank it back! Quick!" He sighed with relief as he saw his madly-driven submarine pause, whip its nose downward, and crash back for the depths from which it had come.

The commander spoke rapidly. "McKegnie, listen: Leave the black lever halfway, so you'll level out. Straighten your helm. We're only a little above you; come round in a circle till I tell you to stop."

The *NX-1* came out of her dive, and, as the cook evidently shoved her helm over, went skirting around in a wide, drunken circle, some thousand feet below her regular crew.

"All right!" Keith shouted. The fear that the octopi submarine would dart back before he could get aboard his ship was looming in his mind. "You're at the helm, Cook; there's a wheel right over your head. Spin it around—oh, my God, there you go again!" He groaned while the *NX-1* went swooping off on a repetition of her crazy circle.

"Sorry, sir," the culinary navigator said thickly. "I guess I got the wrong thing."

"Now!" Wells roared. "Spin that wheel above your head.... That's right—right—there! Don't touch a thing, Cook! We're coming down."

The submarine had paused directly beneath them, listing slightly to port. Then began the cautious business of the descent. Under Wells' rapid orders the men linked arms again and discharged more air from their sea-suits. Slowly, thin chains of bubbles rising behind them, they sank towards the dim shape of the *NX-1* below. Wells' eyes kept probing the thick gloom far beneath. Every moment he expected to see it disgorge a swarm of octopi.

They neared the submarine, and saw numberless pitted spots in her body, where the heat ray had stabbed for a moment. In their excitement they missed their level by some feet, but clutching together they admitted more air and soon rose even with the starboard exit port.

"Swim forward," Keith ordered. "Hurry!" The weird figures groped clumsily, and very slowly neared the port. The commander, in the van, at last reached out and gripped its jutting external controls. He could not work them at first: his hands were numb and awkward.

As he tugged and struggled with them a shout rang in his headphone. It was McKegnie, scared to death.

"Oh, hurry, Mr. Wells!" he yelled. "Quick! Quick, please! The octopis ship's comin', sir! The red light's back!"

Chapter 11: To the Death

The emergency steadied Keith's fingers. He got the door open and motioned Graham and six men inside the water chamber. The passage took but a minute. Then he sent the rest of the crew in, being himself the last to enter. When the chamber was finally empty, and Wells had stepped through the inner door onto the lower deck of the *NX-1*, a great sigh of relief broke from him. Never before had anything looked so good as that brilliantly lit deck with its familiar maze of machinery and bulkheads.

"Thank God," he said simply, and his joy was shared by the whole crew. A new feeling had come over them. Back home—in their own submarine, their own element—they had at least a fighting chance with the octopi. But Keith let them waste no time. He knew that a final, desperate duel to the death with their foe still was ahead. "Above to the control room," he ordered. "Fast!"

They lumbered up the connecting ramp. A disheveled, wild-eyed form met them. Keith couldn't help

chuckling as he passed the now much thinner and paler cook, with the arsenal handy at his waist. On the deck of the control room lay a huge tentacled body, metal-scaled, with its dome of glass shattered and its great cold eyes staring unseeingly away. "I killed him," stammered McKegnie pridefully; "but Mr. Wells—look at that red light, sir!"

Keith glanced rapidly at the location chart, ripping off his sea-suit as he did. The fateful red stud was moving swiftly down on the motionless green one. The men had surrounded McKegnie, laughing and slapping him on the back, but the commander's terse orders jerked them abruptly back to action.

"The rectifiers, Graham: clean out this stale air. Sea-suits off; at emergency posts. Take the helm, Craig; you, Wetherby, trim the ship. No, no, Cook—keep away from the controls!"

The *NX-1* balanced herself; fresh air came rushing in, sweeping out the stale. Keith stared at the location chart, waiting for the submarine to be ready. The red light was almost upon them.

"Right!" he roared at last. "Diving rudder controls, Graham! Full speed for the tunnel!"

At that moment the octopi ship swept into view, its full battery of offensive weapons flaring forth. The paralyzing ray tingled again and again over the control room. Someone laughed at its uselessness. The violet heat ray leveled full at them, but the commander avoided it with "Port ten, starboard ten! Maintain zigzag course to the tunnel." He understood the enemy's weapons now; he was throbbing with the fierce thrill of action. This duel was to be the climax of their whole adventure. "And, by heaven," he promised, "it's going to be a fight!"

The other craft seemed to realize the *NX-1* was now in expert hands. She raced along to starboard for some minutes, her heat ray trying vainly to steady on the American's weaving form. Wells wondered if the king of the octopi was aboard her, in command; he thought perhaps the ship had postponed her chase of McKegnie to pick him up. "I hope he is!" the commander breathed, and fingered the torpedo lever. He had some debts to pay.

The *NX-1*, engines working smoothly, proceeded on a desperate dash for the tunnel that led to the outer sea. But the octopi ship apparently knew what Keith intended, for she abandoned her offensive rays, changed course a few degrees and slowly but steadily pulled ahead. "Damn!" Keith exclaimed. "She'll get there before us!"

The dim shape dwindled on the screen, and before long her bulk had disappeared entirely. Wells then could watch her swift, straight progress only on the location chart.

Ten minutes later the funnel-like opening of the tunnel loomed on the teleview, and squarely in front, blocking it, was the waiting form of the octopi submarine.

"Quarter speed!" Keith snapped. "Hold her steady, Graham; I'm going to try a bow torpedo. I think we're beyond their ray."

Sighting his range on the telescopic range-finder, he worked the *NX-1* slowly into position. He noticed that

his first officer was staring oddly at him. He was bothered by the queer look. "What's wrong?" he asked impatiently.

"But—what about Hemmy Bowman?"

Bowman! In the rush of action and suspense, Keith Wells had completely forgotten his officer in the enemy submarine. "Oh, God!" he groaned. The cruel situation that had stayed his hand once before had again come to falter his course of action. The men were watching him; Graham had a question in his eyes. They all knew what had to be decided....

Keith shrugged his shoulders hopelessly. It was his greater duty to destroy the octopi submarine. And yet —

"Fish for Hemmy, Sparks," he ordered. "Craig, keep present distance from enemy. Full stop."

A moment later the radio operator looked up. "Mr. Bowman on the phones, sir." With a heavy weight on his heart the commander clipped on the extension

headphones.

"Hemmy?"

"Keith? Keith? Thank God you're alive!" Bowman's voice shook with gladness. "You're all back on the *NX-1*, Keith? The whole crew's with you? Oh, Lord, it's good to hear you again!"

"Yes. We got back all right, Hemmy—a miracle. They've still got you prisoner?"

"Yes.... Keith—you're trying to dodge out of the tunnel, aren't you?"

Wells smiled bitterly, and as he paused to frame an answer Bowman spoke again.

"I want you to blow up this submarine, Keith," he said quickly. "A favor to me."

He cut Wells short when the commander started to interrupt. "Wait! Let me finish," he pleaded. "I want to explain. I'd been hoping—but never mind that....

Keith, a while ago I managed to work loose. I lost my head completely and tackled these devils. It was a foolish thing to do; they overcame me, naturally. But, in the struggle, they tore my sea-suit."

"What!"

"Oh, just a tiny tear, or I wouldn't have lasted till now. But a leak all the same—in the right leg. Since then I've been gripping the edges of the fabric as tightly as I can—but I couldn't keep the water inside this ship from seeping through. It came in slowly at first, then faster as my hands grew numb. It's up to my neck now, Keith ... and—it won't be long! I've just a few minutes left...."

The faint words tapered into silence.

"No!" roared Keith in a great rush of emotion. But Hemmy's eager voice came right back:

"Oh yes, you must! It would be a mercy to kill me, Keith."

There were tears in the commander's eyes. "Are you sure, Hemmy?" he asked. "Are you sure?"

"Oh, yes. It would be a mercy."

Wells' lips formed a straight grim line. His words squeezed through it tightly. "All right, Hemmy. Thanks. Thanks. I—I'll go after them now, old man. I'll try and keep in touch with you through the duel, but I—I can't promise—"

He could almost see Hemingway Bowman give his old familiar smile as he answered:

"Then so long, Keith!"

Commander Keith Wells studied the televue screen. The men were half afraid to look at his strained blanched face.

Repeatedly the violet beam speared through the water, reaching for the *NX-1*'s bow.

"Turn ship. Line up for stern torpedoes," the

commander ordered harshly. He realized he could not hold his submarine steady to obtain a perfect sight, for the heat ray needed only thirty seconds to melt through their shell. He would have to swing the ship slowly about; and, as the shape of the enemy crossed the hair-lines on the range-finder, unleash his torpedoes and gamble on hitting the moving target.

The *NX-1* swung around, always maintaining a slight forward motion and zigzagging constantly to nullify the heat beam. Wells watched the range-finder closely. The octopi ship slanted downwards, the deadly violet ray stabbing from her bow. Slowly the black dot that represented her appeared on the dial, and slowly it dropped towards the crossed lines that showed the perfect firing point.

Keith grasped the torpedo lever. The *NX-1*'s stern was towards her target. Dead silence hung in the control room. The *NX-1* swung slightly. The octopi craft appeared directly in the middle of the dial.

Wells pulled back the lever.

The hiss of compressed air sprang from her stern. He had fired two tubes, his whole stock of stern torpedoes. The pair of dreadful weapons leaped out and settled on their course. Keith shot his gaze to the television.

The torpedoes missed. Only by feet, but a miss all the same. They raced on past the octopi submarine and, with a tremendous, ear-numbing explosion, burst on the wall of the cavern beyond. Both ships reeled from the shock. Graham swore viciously, but Wells' masklike face showed no slightest change of expression....

A voice rang in Keith's headphones. "Tough, Keith! Better luck next time!" Then the commander winced. He simply could not answer Hemmy Bowman; could not answer that fine, brave voice....

The stern torpedoes were gone. The tubes could not be reloaded, for the paralyzing ray bound the men to the control room. That left them two torpedoes in the bow.

The violet heat ray kept fingering hungrily on their outer hull, and every man knew that the plates were weakening under the steady strain, which was only lessened by the *NX-1*'s constant zigzagging. The control room was very hot. Both ships were now a full mile from the tunnel entrance. Keith plunged the *NX-1* down, swung her around, to bring his bow tubes to bear, and zigzagged upwards.

It was obvious that the octopi craft had been alarmed by the terrific explosion. They now adopted tactics similar to the American ship's, and for awhile both submarines circled cautiously, maneuvering for an opening.

"If only we could keep the ship steady!" Graham muttered. "But then that heat ray'd get us!"

The commander kept his eyes on the televue. Again and again the violet shaft pronged at them. The heat grew stifling. Sweat was pouring from all the men's bodies. Every face was strained and taut.

"Starboard full!" Wells said suddenly. "A little up,

Graham!" He had seen a chance; the octopi craft was slightly above, and in a moment would pass directly in the line of the bow tubes. The *NX-1* stuck her nose up, swung rapidly to the right. Keith pulled back the firing lever, releasing one torpedo.

The long messenger of death hurtled straight for the enemy's hull. They watched its course breathlessly....

"My God!" the first officer groaned. "Could they see it coming?" For the octopi submarine had swung to one side, neatly dodging the speeding tube of dynamite.

"One left!" he added bitterly. "One left!"

A desperate plan formed in Keith Wells' mind. His last torpedo simply had to strike the mark; he could take no chances with it. He motioned the haggard-faced Graham to him.

"There's only one thing left to do," he said quietly.

"We've got to deliberately face that heat ray; chance its puncturing our plates."

"How do you mean, sir?"

"Get in very close, so as to make our last torpedo sure to hit. We've got to approach the enemy head-on at full speed. We'll corkscrew up to them until we get within two hundred yards, then go straight forward for ten or fifteen seconds, giving us the opportunity to sight the remaining torpedo directly on them. The heat ray may break through before I fire—but when I do fire it's a sure hit."

The men had heard every word. Quietly Wells ordered:

"Take the torpedo control, Graham. I'll take the helm."

The first officer obeyed without a word. Keith grasped the helm. The plans were made for their last desperate attempt.

"Right," the commander said shortly. "Here we go."

There had been a taut silence before, but now,

knowing that they were deliberately offering themselves a perfect target for the heat ray in order to get their last torpedo home, the intensity was almost unbearable. The men felt like shrieking, jumping—doing anything to break the awful hush. The air was charged with the same unnameable something that heralds a typhoon.

Keith Wells was like a white statue at the helm, save for the betraying trickles of sweat that coursed down his drawn cheeks. His hands moved the wheel slowly from port to starboard; his eyes bored at the screen before him. The ship was in command of a man of steel, a man with but one purpose....

"Up—up," he ordered. "Hold—in trim—full speed forward!"

He had brought the *NX-1* directly in line with the octopi ship. And now the craft leaped forward under full power, while he shot the helm back and forth ceaselessly. His ship was describing a corkscrewing motion, weaving straight at the enemy. Grasping her opportunity, the octopi submarine remained

motionless, steadily dousing the approaching American craft with her silent violet ray and driving the temperature in the control room to even greater heights.

The distance between them rapidly lessened. Would the plates stand it? Would the ray melt through the weakened steel before he could fire? With an effort Keith drove these doubts from his mind ... but he could not banish a certain dull, steady ache from his consciousness....

The range dwindled. The heat became intolerable. Everyone's clothing was sopping wet. A man ripped off his shirt, gasping for air. Wells kept his eyes on the screen, though half-blinded by smarting sweat. The plates had to give soon, he knew.

The octopi submarine, beam on and dead ahead, began to move to port at quickly increasing speed. At once Keith stopped swinging the helm, and the *NX-1's* corkscrewing motion of protection ceased. And then came the real test, the gauntlet of seconds.

Right straight into the retreating violet beam they went, at top speed. They gained rapidly. The heat was furnace-like. The commander, watching the range-finder, kept moving the helm slightly over. A shaft of violet heat spanned the two shells of metal. For ten seconds it had held on the *NX-1*. The black dot of the enemy craft moved slowly to exact center on the dial. Fifteen seconds ... twenty ... twenty-three—

"Fire!"

Graham jammed the torpedo lever back.

"Crash dive!"

The deck tilted downward. And Wells' white lips formed the words, "So long, Hemmy!"—and he tore the phones from his head.

Seconds later a titanic explosion sounded through the cavern; echoed and re-echoed in vasty roars. The American craft's lights went off—but not before her men had seen, in the teleview, a fire-shot maelstrom where a moment before the octopi submarine had

been.

"We got them!" yelled Graham.

A roar of exultation burst from every throat. The men flung their arms out, jumped, yelled crazily. Faint emergency lights lit the scene.

"Below, at regular posts," Wells ordered. "Reload bow and stern tubes. Graham, see to the lights." He himself remained at the helm. In a few moments the submarine had climbed back to the level of the tunnel. At quarter speed she nosed into the wide entrance, and slowly forged into the dense, deceptive shadows.

The commander acted mechanically. Again by touch he steered his ship through the black, ragged cleft. Fifteen minutes after leaving the cavern of the octopi her bow poked through the weaving kelp into the free, salty depths of the Atlantic Ocean.

There was one more task to perform, and Wells lost no time in doing it. When two hundred yards away he

halted the *NX-1*, steadied her and sighted the stern tubes just above the dark tunnel hole. Quickly he sent forth two torpedoes.

A huge roar rumbled through the water, whipping the beds of kelp to mad convulsions. "Turn around," the commander ordered harshly. He sighted his bow tubes and again let loose a bolt of two torpedoes. Then he sent the submarine forward, and, through the televue, examined what his four weapons had done.

Huge chunks of rock had been tumbled down, completely closing the tunnel.

"Well," said Graham, "it's over! Finished! They'll never get through that!"

A full-throated cheer burst from the men below, a cheer that rang for minutes as they realized they were free forever of the octopi, of the cold underwater city, of the clutching tentacles. Graham grinned broadly.

"Sound happy—eh?" he chuckled. "Say, Keith, it's good we've got those two octopi our fighting cook killed. Knapp would never believe our story without them!"

He stared curiously at his commander. Wells was standing quite still, facing the teleview screen. A strange, far-away look was in his eyes.

"What's the matter, old man?" the first officer asked, smiling straight at him. "Aren't you glad we won through?"

"Of course," answered Keith with a tired smile in return.

"But why did you look that way?" Graham persisted. And Keith Wells told him:

"I was just wondering if Hemmy told the truth."

he leapt to one side as he spoke

- - -

"The clue, Carnes," said Dr. Bird slowly, "lies in those windows."

Operative Carnes of the United States Secret Service shook his head before he glanced at the windows of the famous scientist's private laboratory on the top floor of the Bureau of Standards.

Dr. Bird and his friend Carnes unravel another criminal web of scientific mystery.

"I usually defer to your knowledge, Doctor," he said, "but this time I think you are off on the wrong foot. If the thieves came in through the windows, what was their object in cutting that hole through the roof? The marks are very plain and they indicate that the hole was cut in some manner from the inside."

Dr. Bird smiled enigmatically.

"That is too evident for discussion," he replied. "I grant you that the thieves entered from the roof

through that hole. After they had secured their booty they left by the same route. I presume that you have noticed the marks on the roof where an aircraft of some sort, probably a helicopter, landed and took off. A question of much greater moment is that of what they did before they landed and cut the hole."

"I don't follow your reasoning, Doctor."

"Carnes, that hole was cut through the roof with a heavy saw. In cutting it, the workers dislodged quite a little plaster which fell to the floor and must have made a great deal of noise. Why wasn't that noise heard?"

"It was heard. The watchman heard it, but knew that Lieutenant Breslau was working here and he thought that he made the noise."

"Surely, but why didn't Breslau hear it?"

"How do we know that he didn't? He was taken to Walter Reed Hospital this morning with his mind an absolute blank and with his tongue paralyzed. He

must have seen the thieves and they treated him in some way to ensure his silence. When he is able to talk, if he ever is, he'll probably give us a good description of them."

Dr. Bird shook his head.

"Too thin, Carney, old dear," he said. "Breslau is a very intelligent young man. He was perfectly normal when I left him shortly after midnight last night. He was working alone in here on a device of the utmost military importance. On the desk is a push button which sets ringing a dozen gongs in the building. Surely a man of that type would have had sense enough when he heard and saw intruders cutting a hole through the roof to sound an alarm which would have brought every watchman on the grounds to his assistance. He must have been knocked out before the hole was started, probably before the helicopter's landing."

"How? Gas of some sort?"

"The windows were all closed and locked and I have

already ascertained that the gas and water lines have not been tampered with. Gas won't penetrate through a solid roof in sufficient concentration to knock out a man like that. It was something more subtle than gas."

"What was it?"

"I don't know yet. The clue to what it was lies, as I told you, in those windows."

Carnes moved over and surveyed the windows closely.

"I see nothing unusual about them except that they need washing rather badly."

"They were washed last Friday, but they do look rather dirty, don't they? Suppose you take a rag and some scouring soap and clean up a pane."

The detective took the proffered articles and started his task. He wet a pane of glass, rubbed up a thick lather of scouring soap and applied it and rubbed vigorously. With clear water he washed the glass and

then gave an exclamation of astonishment and examined it more closely.

"That isn't dirt, Doctor," he cried. "The glass seems to be fogged."

Dr. Bird chuckled.

"So it seems," he admitted. "Now look at the rest of the glass around the laboratory."

Carnes looked around and then walked to a table littered with apparatus and examined a dozen pieces carefully.

"It's all fogged in exactly the same way, Doctor," he said. "The only piece of clear glass in the room is that piece of plate glass on your desk."

Dr. Bird picked up a hammer and struck the plate on his desk a sharp blow. Carnes ducked instinctively, but the hammer rebounded harmlessly from the plate.

"That isn't glass, Carnes," said the doctor. "That plate

is made of vitrilene, a new product which I have developed. It looks like glass, but it has entirely different properties. It is of enormous strength and is quite insensitive to shock. It has one most peculiar property. While ultra-violet and longer rays will penetrate it quite readily, it is a perfect screen for X-rays and other rays of shorter wave length. It appears to be the only piece of transparent substance in my laboratory which has not been fogged, as you call it."

"Do short waves fog glass, Doctor?"

"Not so far as I know at present, but you must remember that very little work has been done with the short wave-lengths. In the vast range of waves whose lengths lie between zero and that of the X-ray, only a few points have been investigated and definitely plotted. There may be in that range a wave-length which will fog glass."

"Then your theory is that some sort of a ray machine was put in operation before the helicopter landed?"

"It is too early to attempt any theorizing, Carnes. Let

us confine ourselves to the known facts. Lieutenant Breslau was normal at midnight and was working in this room. Some time between then and seven this morning he underwent certain mental and physical changes which prevent him from telling us what he observed. During the same period, a hole was cut in the roof and things of great importance stolen. At the same time, all the glass in the laboratory became semi-opaque. The problem is to determine what connection there is between the three events. I will handle the scientific end here, but there is some outside work to be done, and that will be your share."

"Give your orders, Doctor," said the detective briefly.

"To understand what I am driving at, I will have to tell you what has been stolen. Naturally this is highly confidential. Some rumors have leaked out as to my experiments with 'radite,' as I have named the new radium-containing disintegrating explosive on which I have been working, but no one short of the Secretary of War and the Chief of Ordnance and certain of their selected subordinates knows that my experiments have been successful and that the United States is in

a position to manufacture radite in almost unlimited quantities from the pitchblende ore deposits of Wyoming and Nevada. The effects of radite will be catastrophic on the unfortunate victim on whom it is first used. The only thing left to do was to develop a gun from which radite shells could be fired with safety and precision.

"Ordinary propellant powders are too variable for this purpose, but I found that radite B, one form of my new explosive, can be used for propelling the shells from a gun. The ordinary gun will last only two or three rounds, due to the erosive action of the radite charge on the barrel, and ordinary ordnance is heavier and more cumbersome than is necessary. When this was found to be the case, the Chief of Ordnance detailed Lieutenant Breslau, the army's greatest expert on gun design, to work with me in an attempt to develop a suitable weapon. Breslau is a wizard at that sort of work and he has made a miniature working model of a gun with a vitrilene-lined barrel which is capable of being fired with a miniature shell. The gun will stand up under the

repeated firing of radite charges and is very light and compact and gives an accuracy of fire control heretofore deemed impossible. From this he planned to construct a larger weapon which would fire a shell containing an explosive charge of two and one-half ounces of radite at a rate of fire of two hundred shots per minute. The destructive effect of each shell will be greater than that of the ordinary high-explosive shell fired from a sixteen-inch mortar, and all of the shells can be landed inside a two-hundred foot circle at a range of fifteen miles. The weight of the completed gun will be less than half a ton, exclusive of the firing platform. It is Breslau's working model which has been stolen."

Carnes whistled softly between his teeth.

"The matter will have to be handled pretty delicately to avoid international complications," he said. "It's hard to tell just where to look. There are a great many nations who would give any amount for a model of such a weapon."

"The matter must be handled delicately and also in

absolute secrecy, Carnes. We are not yet ready to announce to the world the fact that we have such a weapon in our armory. It is the plan of the President to have a half dozen of these weapons manufactured and give a demonstration of their terrible effectiveness to representatives of the powers of the world. Think what an argument the existence of such a weapon will be for the furtherance of his plans for disarmament and universal peace! Public sentiment will force disarmament on the world, for even the worst jingoist could no longer defend armaments in the face of America's offer to scrap these super-engines of destruction and to destroy the plans from which they were made. If the model has fallen into the hands of any civilized power the damage is not irreparable, for public opinion would force its surrender and return. It is among the uncivilized powers that our search must first be made."

"That makes the problem of where to start more complicated."

"On the contrary, it simplifies it immensely. At the head of the uncivilized powers stands one which has

the brains, the scientific knowledge and the manufacturing facilities to make terrible use of such a weapon. In addition, the aim of that power is to overthrow all world governments and set up in their stead its own tyrannical disorder. Need I name it?"

"You refer to Russia."

"Not to Russia, the great slumbering giant who will some day take her place in the sun in fellowship with the other nations, but to Bolsheviki, that empire within an empire, that horrible power which is holding sleeping Russia in chains of steel and blood. It is there that our search must first be made."

"Of course, they have no official representative in America."

"No, but the Young Labor Party is as much their accredited representative as the British Ambassador is of imperial Britain. Your first task will be to trail down and locate every leader of that group and to investigate his present activities."

"I can tell you where most of them are without investigation. Denberg, Semensky and Karuska are in Atlanta; Fedorovitch and Caspar are in Leavenworth; Saranoff is dead—"

"Presumably."

"Why, Doctor, I saw with my own eyes the destruction of the submarine in which he was riding!"

"Did you see his dead body?"

"No."

"Neither did I, and I will never be sure until I do. Once before we were certain of his death, and he bobbed up with a new fiendish device. We cannot eliminate Saranoff."

"I will include him in my plans."

"Do so. Besides a hypothetical Saranoff, there are a half dozen or more of the old leaders of the gang who are alive and at liberty, so far as we know. They fled

the country after the Coast Guard broke up their alien smuggling scheme, but some of them may have returned. There are also thirty or forty underlings who should be located and checked up on, and, in addition, we must not lose sight of the fact that new heads of the organization may have been smuggled into the United States. It is no simple task that I am setting you, Carnes, but I know that you and Bolton will see it through if anyone can."

"Thanks, Doctor, we'll do our best. If I am not speaking out of turn, what are you planning to do in the mean time?"

"I am going to start Taylor off on an ultra-short wave generator and try a few experiments along that line. Breslau is at Walter Reed and they are doing all they can for him, but until I can get some definite information as to the underlying cause of his condition, they are more or less shooting in the dark."

"How are they treating him?"

"By electric stimulations and vibratory treatments and

by keeping him in a darkened room. By the way, Carnes, if I am correct in my line of thought, it would be well to have an extra guard put over Karuska. He was the only real expert in ordnance that the Young Labor party had, and if they have Breslau's model they'll need him to supervise the construction of a gun."

"I'll attend to that at once, Doctor. Is there anything else?"

"Not that I know of. I am going out to Takoma Park this afternoon and have another look at Breslau, but it is too soon to hope for any change in his condition. Aside from the time I will be out there, you can find me either here or at my home, in case anything develops."

"I'll get on the job at once, Doctor."

"Thanks, old dear. Remember that speed must be the keynote of your work."

The telephone bell at the head of Dr. Bird's bed woke

into noisy activity. The doctor roused himself and took down the instrument sleepily. A glance at the clock showed him that it was four in the morning and he muttered a malediction on the one who had called him.

"Hello," he said into the receiver. "Dr. Bird speaking."

"Doctor," came a crisp voice over the wire, "wake up! This is Carnes talking. Something has broken loose!"

All trace of sleep vanished from Dr. Bird's face and his eyes glowed momentarily with a peculiar glitter which Carnes would at once have recognized as indicative of the keenest interest.

"What has happened, Carnes?" he demanded.

"I telephoned Atlanta this morning and arranged to have an extra guard put over Karuska as you suggested. The matter was simplified by the fact that he and nine others were confined in the prison infirmary. The warden agreed to do as I told him, and, in addition to the regular guards, a special man was

placed in the ward near Karuska's bed. At 2 A. M. the lights in the ward went out."

"Accidentally, or were they put out?"

"They haven't found out yet. At any rate they are all right now, but Karuska and all of the other inmates and all the guards of that particular ward have gone crazy."

"The dickens you say!"

"Not only that, they are also partially paralyzed. The description I got over the telephone corresponds exactly with the condition of Lieutenant Breslau as you described it to me. Here is the most interesting part of the whole affair. The special guard over Karuska was only lightly affected and has already recovered and is in a position to tell you exactly what happened. I got a garbled account of the affair from the warden, something about a goldfish bowl or something like that, the warden wouldn't take it seriously enough to give me details. I didn't press for them much for I knew that you would rather get them

at first hand."

"I certainly would. I'll be ready to leave for Atlanta in less than ten minutes."

"I expected that, Doctor, and a car is already on its way to pick you up. I'll meet you at Langley Field where a plane is already being tuned up and will be ready to take off by the time we get there."

"Good work, Carnes. I'll see you at the field."

A car was waiting for Carnes and Dr. Bird when the Langley Field plane slid down to a landing at Atlanta. At the penitentiary, Dr. Bird went direct to the infirmary where Karuska had been confined. As he entered, he shot a keen glance around and gave an exclamation of satisfaction.

"Look at the windows, Carnes," he cried.

Carnes went over to the nearest window and moistened his finger tip and applied it experimentally to the glass. The moisture produced no effect, for the

glass of the windows was permanently clouded as was that of the doctor's laboratory.

"Whatever happened in my laboratory the night before last was repeated here last night with a similar object," said the doctor. "The object there was to steal a gun model; here it was to steal a man who could construct a full-sized gun from the model. I understand that one of the guards escaped the fate which overtook the rest of the persons in the infirmary?"

"Not altogether, Doctor," replied the warden. "I think that his mind is somewhat affected, for he tells a wild yarn and insists on trying to wear a goldfish bowl on his head. I have him under observation in the psychopathic ward."

Dr. Bird shot a scornful glance at the warden.

"'There are none so blind as those who will not see'," he murmured.

"By all means, I wish to see him," he went on aloud.

"Will you have him brought here at once, please?"

The warden nodded and spoke to one of the attendants. In a few moments a tall, fair-haired young giant stood before the doctor. Dr. Bird pushed back his unruly shock of black hair with his fingers, those long slim mobile fingers which alone betrayed the artist in his make-up, and shot a piercing glance from his black eyes into the blue ones, which returned the gaze unabashed.

"What is your name?" he asked.

"Bailey, sir."

"You were on guard here last night?"

"Yes, sir. I was detailed as a special guard over No. 9764."

"Tell me in your own words just what happened. Don't be afraid to speak out; I'm not going to disbelieve you; and above all, tell me everything, no matter how unimportant it may seem to you. I'll judge the

importance of things for myself. I'm Dr. Bird of the Bureau of Standards."

The guard's face lighted up at the doctor's words.

"I've heard of you, Doctor," he said in a relieved tone, "and I'll be glad to tell you everything. At ten o'clock last night, I relieved Carragher as special guard over No. 9764. Carragher reported that the prisoner was somewhat restless and hadn't been asleep as yet. I sat down about fifteen feet from his bed and prepared to keep an eye on him until I was relieved at six o'clock this morning.

"Nothing happened until about two o'clock. No. 9764 was restless as Carragher had said, but toward midnight he quieted down and apparently went to sleep. I was sleepy myself, and I got up and took a turn around the room every five minutes to be sure that I kept awake. That's how I am so sure of the time, sir."

Dr. Bird nodded.

"At five minutes to two, just as I got up, I heard a noise outside like a big electric fan. It sounded like it came from directly overhead and I went to the window and looked out. I couldn't see anything, although I could hear it pretty plainly, and then I heard a noise like something had fallen on the roof. Almost at the same time there came a sort of high-pitched whine, a good deal like the noise an electric motor makes when it is running at high speed.

"I thought of giving an alarm, but I didn't want to stir things up unless I was sure that there was some necessity for it, so I started for the door to ask one of the outside guards if he had heard anything. As I turned toward No. 9764 I saw that he had been sitting up in bed while my back was turned. As soon as he saw that I noticed him, he lay back real quick and pulled the covers over his head. He moved pretty quick, but not so quick that I couldn't see that he had something that glittered like glass before his face. I started over toward his bed to see what he was doing and then it was that the lights started to get dim!"

"Go on!" said the doctor as Bailey paused. His eyes

were glittering brightly now.

"Well, sir, Doctor, I don't hardly know how to describe what happened next. The lights were getting dim, but not as they ordinarily do when the current starts to go off. The filaments were shining as bright as they ever did, but the light didn't seem to be able to penetrate the air. The whole room seemed to be filled with a blackness that stopped the light. No, sir, it wasn't like fog; it was more like something more powerful than the lights was in the room and was killing them.

"It wasn't only the lights which were affected, it was me as well. This blackness, whatever it was, was getting into me as well as into the room, and I couldn't seem to make myself think like I wanted to. I tried to yell to give an alarm, and I found that I could hardly whisper. I went toward the bed and then I saw No. 9764 sit up again. He had a goldfish bowl pulled down over his head and it was evident that it was keeping the blackness away, for I could see him plainly and his eyes were as bright as ever.

"The nearer I got to him, the funnier I felt, and I

began to be afraid that I would go out. No. 9764 got up out of bed, and I could see him grinning at me through the bowl. He reached up and adjusted that bowl, and all of a sudden I realized that whatever was knocking me out was not affecting him because he had that thing on. I jumped for him with the idea of taking the bowl off and putting it on my own head. He saw what I was up to and he fought like a cornered rat, but the blackness hadn't affected my muscles. I'm a pretty big man, sir, and No. 9764 is a little runt, and it didn't take me long to get the bowl off his head and pulled on over mine. As soon as I did that, I seemed to be able to think clearer. I was sitting on No. 9764 and was ready to tap him with a persuader if he started anything, but I didn't have to. In a few minutes he stopped struggling and lay perfectly quiet.

"The lights kept getting dimmer and dimmer until they went out altogether and the room became pitch dark. It wasn't exactly as if the lights had gone out, sir; I seemed to know that they were still there and were burning as bright as ever, but they couldn't penetrate the blackness in the room, if you

understand what I mean."

"I think I do," said Dr. Bird slowly. "It was a good deal as if you had seen a glass filled with a pale red liquid and someone had dumped black ink into the fluid and hid the red color. You would know that the red was still there, but you wouldn't be able to see it through the black."

"That's exactly what it was like, Doctor; you have described it better than I can. At any rate, after it got real dark I heard a low whistle from the roof. No. 9764 made a struggle to get up for a moment and then lay quiet again. The whistle sounded again and then I heard some one call 'Caruso.' Everything was quiet for a while and then the same voice called again and said some stuff in a foreign language that I couldn't understand. I kept perfectly quiet to see what would happen.

"For about ten minutes the room remained perfectly dark, as I have said, and all the while I could hear that whining noise. All of a sudden it began to sound in a lower note and then I could see the lights again,

very dimly and like the black ink you spoke of was fading out. The note got lower until it stopped altogether, and the lights came on brighter until they were normal again. Then I heard a scraping noise on the roof and the noise I had heard at first like a big electric fan. I looked at the clock. It was two-twenty.

"For a few minutes I wasn't able to collect my wits. When I got up off of No. 9764 at last he stared at me as though he didn't know a thing, and I heaved him back into his bed and ran to the door to summon an outside guard. I could still talk in a husky whisper, but not loud, and I wasn't surprised when no one heard me. My orders were not to let No. 9764 out of my sight, but this was an emergency, so I left the ward and found a guard. It was Madigan and he was standing on his beat staring at nothing. When I touched him he looked at me and there was the same vacant look in his eyes that I had seen in the prisoner's. I talked to him in a whisper, but he didn't seem to understand, so I left him and went to a telephone and called for help. Mr. Lawson, the warden, got here with guards in a couple of minutes

and I tried to tell him what had happened, but I couldn't talk loud, and I was afraid to take the fish bowl off my head."

"What happened next?"

"Mr. Lawson took me to his office, and on the way we passed under an arc light. As soon as I got under it I begin to feel better, and my voice came stronger. I saw that it was doing me some good and I stopped under it for an hour before my voice got back to normal. It seemed to clear the fog from my brain, too, and I was able, about four o'clock, to tell everything that had happened. Mr. Lawson seemed to think that my brain was affected as well as the others' and he sent me to the hospital. That's all, Doctor."

"Do you feel perfectly normal now?"

"Yes, sir."

"There is no need for confining this man longer, Mr. Lawson. He is as well as he ever was. Carnes, get the Walter Reed Hospital on the telephone and tell them

that I said to treat Lieutenant Breslau with light rays, rich in ultra-violet. Tell them to give him an overdose of them and not to put goggles on him. Keep him in the sun all day and under sun-ray arcs at night until further orders. Mr. Lawson, give the same treatment to the men who were disabled last night. If you haven't enough sun-ray arcs in your hospital, put them under an ordinary arc light in the yard. Bailey, have you still got that goldfish bowl?"

"It is in my office, Doctor," said the warden.

"Good enough! Send for it at once. By the way, you have two more communists here, Denberg and Semensky, haven't you?"

"I think so, although I will have to consult the records before I can be positive."

"I am sure that you have. Look the matter up and let me know."

The warden hurried away to carry out the doctor's orders, and an orderly appeared in a few moments

with a hollow globe made of some crystalline transparent substance. Despite its presence in the infirmary the evening before, there was no trace of clouding apparent. Dr. Bird took it and examined it critically. He rapped it with his knuckles and then stepped to the door and hurled it violently down on the concrete floor of the yard. The globe rebounded without injury and he caught it.

"Vitrilene, or a good imitation of it," he remarked to Carnes. "After you get through talking to the hospital, get Taylor on the wire. There is plenty of loose vitrilene in the Bureau, and I want him to send down about fifty square feet of it by a special plane at once."

As Carnes left the room, the warden reappeared.

"The men are all lying in the sun now, Doctor," he said. "I find that we have the two men you mentioned confined here. They are both in Tier A, Building 6."

"Is that an isolated building?"

"No, it is one wing of the old main building."

"On which floor?"

"The second floor. It is a six-story building."

"Have they been moved there recently?"

"They have been there for nearly a year."

"In that case there will be little chance of another attack of this sort to-night. At the same time, I would advise you to station extra guards there to-night and every night until I notify you otherwise. Caution them to watch the lights carefully and to give an alarm at once if they appear to get dim. In such a case, send men to the roof with rifles with orders to shoot to kill anyone they find there. I am going back to Washington and I am going to take Karuska, your No. 9764 with me. You had better have one of the guards in the corridor, where Denberg and Semensky are, wear this goldfish bowl, as you call it. A lot of plate glass—at least it will look like that—will come from Washington by plane. Cut it into sheets a foot square

and use surgeon's plaster to make some temporary glass helmets for your men. I want all your guards to wear them until I either settle this matter or else send you some better helmets. Do you understand?"

"I understand all right, but I'm afraid that I can't do it. The wearing of such appliances would interfere with the efficiency of my men as guards."

"Brain and tongue paralysis would interfere rather more seriously, it seems to me. In any event, I have sufficient authority to enforce my request. If you are at all doubtful, call up the Attorney General and ask him."

The warden hesitated.

"If you don't mind, I think I will call Washington, Doctor," he said. "I will have to get authority to turn No. 9764 over to you in any event."

"Call all you wish, Mr. Lawson. Mr. Carnes is talking to Washington now and we'll have a clear line through for you in a few minutes. Meanwhile, get a set of

shackles on Karuska and get him ready to travel by plane. He appears to be suffering from mental paralysis, but I don't know how his case will develop. He may go violently insane at any moment and I don't care to be aloft in a plane with an unbound maniac."

Major Martin looked up from the prone figure of Karuska.

"His condition duplicates that of Lieutenant Breslau, Dr. Bird," he said. "We received your telephoned message this afternoon and we kept Breslau in a flood of sunlight until dusk, and then put him under sun-ray lamps. I don't know how you got on to that treatment, but it is having a very beneficial effect. He can already make inarticulate sounds, and his eyes are not quite as vacant as they were. If he keeps on improving as he has, he should be able to talk intelligently in a few days. If you wish to question this man, why not give him the same treatment?"

"I haven't time, Major. I must make him talk to-night if it is humanly possible. I called you in because you are the most eminent authority on the brain in the

government service. Is there any way of artificially stimulating this man's brain so that we can force the secrets of his subconscious mind from him?"

The major sat for a moment in profound thought.

"There *is* a way, Doctor," he said at length, "but it is a method which I would not dare to use. By applying high frequency electrical stimulations to the medulla oblongata, at the same time bathing the cerebellum with ultra-violet, it might be done, but the chances are that either death or insanity would result. I would not do it."

"Major Martin, this man is a reckless and dangerous international criminal. If his gang carries out the plan which I fear they have formed, the lives of thousands, yes, of millions, may pay for your hesitation. I will assume full responsibility for the test if you will make it, and I have the authority of the President of the United States behind me."

"In that case, Doctor, I have no choice. The President is the Commander-in-chief of the army, and if those

are his orders the experiment will be carried out. As a matter of form, I will ask that your orders be reduced to writing."

"I will write them gladly, Major. Please proceed with the experiment without delay."

Major Martin bowed and spoke to a waiting orderly. The prostrate figure of Karuska was wheeled down a corridor into the electrical laboratory, and with the aid of the laboratory technician the surgeon made his preparations. The Moss lamp was arranged to throw a flood of ultra-violet over the Russian's cranium while the leads from a deep therapy X-ray tube was connected, one to the front of Karuska's throat and the other to the base of his brain. At a signal from the major, a nurse began to administer ether.

"I guarantee nothing, Dr. Bird," said the major. "The paralysis of the vocal cords may be physical, in which case the victim will still be unable to speak, regardless of the brain stimulation. If, however, the evident paralysis is due to some obscure influence on the brain, it may work."

"In any, event I will hold you blameless and thank you for your help," replied the doctor. "Please start the stimulation."

Major Martin closed a switch, and the hum of a high tension alternator filled the laboratory. The Russian quivered for a moment and then lay still. Major Martin nodded and Dr. Bird stepped to the side of the operating table.

"Ivan Karuska," he said slowly and distinctly, "do you hear me?"

The Russian's lips quivered and an unintelligible murmur came from them.

"Ivan Karuska," repeated Dr. Bird, "do you hear me?"

There was a momentary struggle on the part of the Russian and then a surprisingly clear voice came from his lips.

"I do."

"Who is the present head of the Young Labor party?"

Again there was a pause before the name "Saranoff" came from the lips of the insensible figure. Carnes gave a sharp exclamation but a gesture from the doctor silenced him.

"Is Saranoff alive?"

"Yes."

"Is he in the United States?"

"No, he is in London."

"Is he coming to the United States?"

"Yes."

"When?"

"I don't know. Soon. As soon as we are ready for him."

"Where is he living in London?"

"I don't know."

"How did you get word that you were to be rescued from Atlanta?"

"A message was smuggled in to me by O'Grady, a guard in our pay."

"What was that vitrilene helmet for?"

"To protect me from the effects of the black lamp."

"What is the black lamp?"

"I don't know exactly. Saranoff invented it. It gives a black light and it kills all other light except sunlight, and it paralyses the brain."

"Did you know that the model of the Breslau gun had been stolen?"

"Yes."

"What were you going to do after you were rescued from jail?"

"I was going to make a full-sized gun. We have a disappearing gun platform built in the swamps at the juncture of the Potomac and Piscataway Creek. The gun was to be mounted there and we would shell Washington and institute a reign of terror. It would be a signal for uprisings all over the country."

"Is there a black lamp at that gun platform?"

"Yes. The black lamp will kill both the flash and the report."

"Where did you get the formula for radite?"

"We got it from one of Dr. Bird's assistants. His name —"

As he spoke the last few sentences, Karuska's voice had steadily risen almost to a shriek. As he endeavored to give the name of the doctor's treacherous helper his voice changed to an unintelligible screech and then died away into silence. Major Martin stepped forward and bent over the prone figure. Hurriedly he tore away the electrical

connections and placed a stethoscope over the Russian's heart. He listened for a moment and then straightened up, his face pale.

"I hope that the information you obtained is worth a life, Dr. Bird," he said, his voice trembling slightly, "because it has cost one."

"It may easily save thousands of lives. I thank you, Major, and I will see that no blame attaches to you for your actions. I only wish that he had lived long enough to tell me the name of my assistant who has sold me to Saranoff. However, we'll get that information in other ways. Carnes, telephone Lawson at Atlanta to slam O'Grady into a cell pending investigation while I get Camp Meade on the wire and order up a couple of tanks. We are going to attack that gun emplacement at daybreak."

The telephone bell in the laboratory jangled sharply. Major Martin answered it and turned to Carnes.

"You're wanted on the telephone, Mr. Carnes."

The detective stepped forward and took the transmitter.

"Carnes speaking," he said. "Yes. Oh, hello, Bolton. Yes, we have Karuska here, or rather his body. Yes, Dr. Bird is here right now. You've what? Great Scott, wait a minute."

"Dr. Bird," he cried eagerly turning from the telephone, "Bolton has located the Washington headquarters of the Young Labor party."

Dr. Bird sprang to the instrument.

"Bird speaking, Bolton," he cried. "You've located their headquarters? Who's running it? Stanesky, eh? You're on the right track; he used to be Saranoff's right hand man. Where is the place located? I don't seem to recollect the spot. You have it well surrounded? Where are you speaking from? All right, we'll join you as quickly as we can. Keep your patrols out and don't let anyone get away."

He hung up the receiver and turned to Carnes.

"Did you have the car wait?" he asked. "Good enough; we'll jump for the Bureau and pick up all the vitrilene laying around loose and then join Bolton. He thinks that he has the whole outfit bottled up."

Bolton was waiting as the car rolled up and Dr. Bird leaped out.

"Where are they?" demanded the doctor eagerly.

"In an abandoned factory building about three hundred yards from here," replied the Chief of the Secret Service. "I traced them through New York. We have been watching the place ever since yesterday noon, and I know that Stanesky is in there with half a dozen others. No one has tried to leave since we set our watch. One funny thing has happened. About an hour ago a peculiar red glow suffused the whole building. It has died down a good deal since, but we can still see it through the windows. Could you tell us what it means?"

"No. I couldn't, Bolton, but we'll find out. How many men have you?"

"I have sixteen stationed around."

"That's more than we'll need. I have only vitrilene shields and helmets enough to equip six men. Pick out your three best men to go with us and we'll make a try at entering."

Bolton strode off into the darkness and returned in a few moments with three men at his heels. Dr. Bird spoke briefly to the operatives, all of them men who had been his companions on other adventures. He explained the need for the vitrilene helmets and shields, and without comment the six donned their armor and followed Bolton as he strode toward the building. As they approached, a dull red glow could be plainly seen through the windows, and Dr. Bird paused and studied the phenomenon for a moment.

"I don't know what that means, Bolton," he said softly, "but I don't like the looks of it. Stanesky is up to some devilment or other. I wouldn't be a bit surprised to find out that he knows all about your pickets and is ready for a raid."

"We'd better rush the place, then," muttered Bolton.

Dr. Bird nodded agreement and with a sharp command to his men Bolton broke into a run. Not a shot was fired as they approached, and the front door gave readily to Bolton's touch. At it opened there came a grating sound from the roof followed by the whir of a propeller. Dr. Bird ran out of the building and glanced up.

"A helicopter!" he cried. "They were expecting us and have escaped!"

He drew his pistol and fired ineffectually at the great bird-like ship which was rising almost noiselessly into the air. He cursed and turned again to the building.

Bolton still stood in the room which they had first entered. His flashlight showed it to be empty, but from under a door on the opposite side a line of dull red light glowed evilly. With his pistol ready in his hand, Bolton approached the door on hands and knees. When he reached it he threw his shoulder against it and dropped flat to the floor as the door

swung open. No shot greeted him, and he stared for a moment and then rose to his feet.

"Nothing in here but some glass statues," he announced.

Dr. Bird followed him into the room. As he looked at what Bolton had called glass statues he gasped and shielded his eyes.

"God in Heaven!" he ejaculated. "Those were living men!"

Before them were three men or what had been three men. All stood in strained attitudes with a look of horror frozen on their faces. The thing that made the spectators shudder was that their bodies had, by some diabolical method, been rendered semi-transparent. The dull red light which suffused the room emanated from the three bodies. Dr. Bird examined them closely, being careful not to touch them.

"The identity of my treacherous assistant is known,"

he said grimly as he pointed at the middle figure. "It was Gerond. What is this?"

He took an envelope from the hand of the middle figure and opened it. A sheet of paper fell out and he picked it up and read it.

"My dear Mr. Bolton," ran the note. "Your methods of tracing and picketing my headquarters are so crude as to be almost laughable. This base has served its purpose and we were ready to abandon it in any event, but I couldn't resist the temptation to let you almost nab us. The three men whom you will find here are agents who failed in their duty. If you are interested in learning the method of their execution, you might take to heart the words of your colleague, Dr. Bird: 'The clue lies in those windows.'"

Carnes glanced at the windows and gave a cry of surprise. The glass was opaque, as had been the glass in the doctor's laboratory and the glass in the infirmary at Atlanta. The fogging however, was much more pronounced, and the opaque glass gave faintly the same red effulgence which came from the three

bodies.

"What does it mean, Doctor?" he asked.

"I don't know, Carnes," said Dr. Bird slowly. "I foresee that I am going to have to do a great deal of work on short wave-lengths soon. It is doubtless the effect of some modification of the black lamp which has done it. Look out!"

He leaped to one side as he spoke, drawing Bolton and Carnes with him. A panel in the side of the wall opposite the doorway had slid silently open and through the opening poured out a beam of fiery red. Full on the three bodies it fell, and then spread out to fill the room. Dr. Bird had drawn the two nearest men out of the direct beam, but one of the secret service men stood full in its path. In the excitement of entering he had dropped his vitrilene shield and the livid ray fell full on his defenceless body. As they watched an expression of horror spread over his face and he strove to move to one side, but he was held helpless. Slowly he stiffened; and, as the ray bored through him, his body became semi-transparent and

the same dull red glow which emanated from the three bodies they had found began to shine forth from him. Bolton strove to break from the doctor's grasp and rush to the rescue but Dr. Bird held him with a grip of iron.

"Too late," he said grimly. "Chalk up another murder to the arch fiend who has committed the others. I don't know the nature of that ray and vitrilene may not be an adequate defence against its full force. We had better get out of here and attack the place from the rear."

Carefully edging their way around the sides of the room, the five men made their way out through the door. Dr. Bird slammed the door shut behind him and led the way out of the building and around to the rear. A door loomed before them and he cautiously tried it. It gave to his touch and he entered. As he set his foot on the threshold a terrific explosion came from the interior of the building.

"Run!" he shouted as he led the way in retreat. "If that is a radite explosion it will act for several

seconds!"

From a safe distance they watched. One corner of the building had been torn off by the force of the explosion, and as they watched the rest of the building gradually collapsed and sank into a pile of ruins.

"They had planned on a visit from us all right," said Dr. Bolton grimly. "They had a surprise for us any way we jumped. If we went in the front door, that devil's ray was to finish us, and if we went in the back door the whole place was arranged to blow up as we entered. I only hope that Stanesky thinks that he has got us all and doesn't expect an attack on his next base in the morning. If he doesn't, I think we may give him a rather unpleasant surprise. Of course, that lamp is smashed into atoms and buried under the debris, but I don't know what other devil's contraptions that ruin holds. Bolton, have your men picket it and allow no one near until I get back. I've got to get to a telephone and get a couple of tanks from Meade and a plane or two from Langley Field."

Two tanks made their way slowly across country. The front of each tank was protected by a heavy sheet of vitrilene, while from the turrets of the tanks projected the wicked looking muzzles of thirty-seven millimeter guns. Overhead two airplanes from Langley Field soared, scouting the country. Dr. Bird and Carnes rode in the leading tank.

"It ought to be somewhere near here, unless Karuska lied," said Carnes as he swept the country with a pair of binoculars.

"He didn't lie," returned Dr. Bird. "It was his subconscious mind that spoke and it never lies. He spoke of the gun emplacement as being in a swamp and I have a strong idea that it is submersible. Of course, it is bound to be well camouflaged, both from land and from air observation."

The planes circled around again and again, quartering the air like a pair of well-trained bird dogs will quarter a hunting field. First high and then low they swooped back and forth, the tanks lumbering slowly along in the same direction. Presently the

occupants of the leading tank saw one of the planes bank sharply and swing around. It dropped to an altitude of only a few hundred feet and turned and went back over the ground it had just crossed.

"I believe that fellow sees something!" exclaimed Carnes.

As he spoke, three green Very lights came from the cockpit of the plane. The tank driver gave a grunt of satisfaction and turned the nose of his vehicle in that direction. The second tank followed.

Hardly had they turned in the new direction before the ground began to get soft under their tracks and the heavy vehicles began to sink. The driver of the Doctor's tank forced it ahead, but the tank sank deeper in the mire until water flowed in around the feet of the occupants.

"I reckon we'll have to get out and walk pretty soon, Doctor," said the driver.

Dr. Bird grunted in acquiescence. The tank made its

way forward a few yards before the engine sputtered and died. The second tank stopped when the first one did, fifty yards behind it. Donning vitrilene helmets and taking vitrilene shields in their hands, the crews of both tanks climbed out into the waist-deep water and gathered around the Doctor for orders.

"Form a skirmish line at ten-pace intervals and cross the swamp," he directed. "We may meet with no opposition, but if there is, the more scattered we are, the safer we will be. You all have hand grenades as well as your rifles?"

A murmur of assent answered him and the line formed and started across the swamp. They had gone perhaps a hundred yards when three red lights came from one of the planes circling overhead.

"Down!" cried the doctor, dropping to his knees in the muck.

Four hundred yards ahead of them a concrete platform emerged from the marsh and rose slowly into the air. It was roofed with a dome of what looked

like plate glass, but which the doctor shrewdly suspected was vitrilene. When the base of the platform was two-feet above the level of the water the dome slid silently aside disclosing two men bending over a tiny gun. Dr. Bird leveled his binoculars.

"That's the Breslau gun model that was stolen as sure as I'm a foot high!" he cried. "They must have made some miniature shells and be planning to fire it."

Slowly a pall of intense blackness rose from the marsh and enveloped the platform and hid it from view. A whining noise came from overhead, and then a crash like a thunderbolt. The blast of the explosion threw the attackers face down in the swamp, and when they arose and looked back there was merely a gaping hole where the leading tank had been. The second tank suddenly seemed to rise in the air and fly into millions of tiny fragments, and a second thunderous blast sent them again to their knees.

"Radite!" bellowed Dr. Bird to Carnes. "Imagine the effect if that had been a full charge fired from a completed Breslau gun! Watch the planes, now. I

think they are going to drop a few eggs on them."

The black mist cleared as if by magic and the platform was in plain view. The big glass dome rolled back into place as the two planes swept over at an elevation of two thousand feet. From each one a small black cigar-shaped object was released and fell in a long parabola toward the earth. The glass dome which had been closing over the gun platform rolled quickly back and a long beam of intense blackness pierced the heavens. First one and then the other of the falling bombs disappeared from view into it, and then the black column faded from view. The two bombs fell with increasing speed but the dome closed over the platform before they struck. The two hit the dome at almost the same instant and instead of the blinding crash they expected, the watchers saw the bombs rebound from the dome and fall harmlessly into the water.

"Stymied!" muttered the doctor. "I wonder what other properties that confounded lamp has."

He resumed his advance, Carnes and the soldiers

keeping abreast of him. When they were within two hundred yards of the platform it rose again and the transparent dome rolled back. A beam of black shot forth over the swamp, searching them out and hiding them from view. First one and then another felt the effects of the black beam; but the vitrilene which the Doctor had provided stood them in good stead, and, aside from a slight shortening of their breath, none of the attackers felt any the worse.

"Come on, men!" cried the Doctor as his athletic figure plowed forward through the breast-deep water. "That is their worst weapon and it is harmless against us!"

Cheering, they fought their way toward the platform. It sunk for a moment and then rose again. As the dome swung back a sharp crackle of machine-gun fire sounded and the water before them was whipped into foam by the plunging bullets. One of the soldiers gave a sharp cry and slumped forward into the water.

"Fire at will!" shouted the lieutenant in command.

A crackle of rifle fire answered the tattoo of the machine-gun, and the sharp ping of bullets striking on the dome could be plainly heard. An occasional shot kicked up a spurt of white dust from the concrete, but the machine-gun kept up a steady rattle of fire and the soldiers kept their heads almost at the level of the water. There came the roar of an airplane motor, and one of the planes swept over the platform, a hundred yards in the air, with two machine-guns spraying streams of bullets onto the platform. Two men abandoned their machine-gun and crouched under the partially folded-back dome as the second plane swept over, and Dr. Bird took advantage of the lull to advance his party a few yards nearer. Again the defenders of the platform rushed to their gun, but the first plane had turned and swooped down with both guns going, and again they were forced to take shelter while the Doctor and his force made another advance.

The second plane had turned and followed the first, but the defenders had had enough. The transparent dome closed over them and the platform sank into the

marsh. With a shout, Dr. Bird led the way forward again.

The attackers were within a hundred yards of the platform when it again rose above the surface of the water. The guns had disappeared, but in their place stood an airship. It was a small affair with stubby wings above which were two helicopter blades revolving at high speed. No sound of a motor could be heard.

The transparent dome rolled back and like a bullet the little craft shot into the air, followed by a futile volley from the soldiers. Hardly had it appeared than the two airplanes bore down on it with machine-guns going. The helicopter paid no attention to them for a moment, and then came a puff of smoke from its side. The leading plane swerved sharply and the helicopter fired again. The leading plane maneuvered about, trying to get a machine-gun to bear, while the second plane climbed swiftly to get above the helicopter and pour a deadly stream of fire down into it. It gained position and swooped down to the attack, but another puff of smoke came from the side of the helicopter

and there was a thunderous report and a blinding flash in the sky. As the smoke cleared away, no trace of the ill-fated plane could be seen. The helicopter hung motionless in the air as though daring the remaining plane to attack.

The plane accepted the challenge and bore down at full speed on the stranger. Again came a puff of smoke, but the plane swerved and an answering shot came from its side. It was above the helicopter, and the shell which missed its mark plunged to the ground. When it struck there came a roar and a flash and the whole earth seemed to shake. The helicopter shot upward into the air and forward, both its elevating fans and its propellers whirling blurs of light. The airplane followed at its sharpest climbing angle, but was helpless to compete with its swifter climbing rival.

"He's got away!" groaned Carnes.

"Not yet, old dear!" cried the Doctor hopping with excitement. "He isn't safe yet. I never told you, but one Breslau gun had been made and it is on that

plane. It has deadly accuracy and is good for fifteen miles. That's Lieutenant Dreen at the controls and Mason at the gun."

As he spoke the plane swung around and made a half loop. For a few yards it flew upside down and then whirled swiftly. As it turned there came a sharp report and a puff of smoke from its rear cockpit. High above, the helicopter had ceased climbing and hovered motionless. As the plane fired, the helicopter shot forward like an arrow from a bow, and thereby spelled its doom. Not for nothing did Captain Mason bear the title of the best aerial gunner in the Air Corps. He had foreseen what the action of his opponent would be and had allowed for just such a move. Far up in the sky came a blinding flash and a cloud of smoke. When the smoke cleared the sky was empty, except for a little scattered debris falling slowly to the ground.

"And that's that!" exclaimed Dr. Bird as he finished his examination of the underground laboratory with which the gun platform connected. "The lamp has gone to glory with Breslau's gun model and two of the best brains of the Young Labor party. I am sure that

Stanesky was one of those two men. I wish the whole gang had been on board."

"Don't you think that this is the end of it, Doctor?" asked Carnes.

"No, Carnes, I don't. We know that the real brains of this outfit is Saranoff, and Saranoff is still alive. He probably won't try to use his black lamp again, because I will have a defence against it in a short time, now that I have seen it in action, but he'll try something else. The whole object of life to a loyal citizen of Bolshevikia is to reduce the whole world to the barbarous level in which they hold Russia, and they will spare no pains or effort to accomplish it. The greatest obstacle to their success at present is the President of the United States. He is loved and respected by the whole world, and if he is spared he will forge the world into a great machine for the preservation of peace and universal good will. That would be fatal to Bolshevikia's plans, and they will spare no effort to remove him. By the grace of God, we have saved him from harm so far, but until we remove Saranoff permanently from the scene, I will

never feel safe for him."

"What do you suppose they'll try next, Doctor?"

"That, Carnes, time alone will tell."

72 Phalanxes of Atlans by Francis Van Wyck Mason

Only in dim legends did mankind remember Atlantis and the Lost Tribes—until Victor Nelson's extraordinary adventure in the unknown arctic.

Aproximate word count:

Bigotry:

Warnings:

grasshoppers

Victor Nelson violently forward to lie in the deep snow at the bottom of a tiny crevasse, down which the merciless gale moaned like an anguished demon.

"It's no use," he muttered bitterly. "We've fought hard, but we're done for."

He lay still, stupidly watching his breath form tiny beads of ice on the ends of the fur which lined his parka. Until that moment he had not realized how thoroughly exhausted he was. Every muscle of his starved, bruised body ached unbearably. It wasn't so bad lying there in the soft snow. He could rest, then look later for the ice hummock behind which the plane lay sheltered. Rest! That's what he needed, a good long rest.

But deep within him, a primal instinct stabbed his waning consciousness. "No," he gasped, and blinked his reddened eyes behind smoked goggles which dulled the shimmer of the aurora. "If I stop, I'll never get up."

Shaken by the terrific velocity of the arctic gale he

numbly clambered to his feet, then stooped with a stiff awkward motion to retrieve a Winchester rifle which lay half buried in the snow beside the blurred imprint of his body.

"Wonder if Alden had any better luck?" The question burned dully in his brain. "Don't suppose so; there can't be anything alive in this God-awful wilderness." As he stumbled on he found no answer in an unbroken vista of wind-scored ice and drifting snow that, swirling high into the air, momentarily cut off the view of that black line of ice-capped mountains barely visible on the horizon.

"Yes, if he hasn't found anything, we'll be dead or frozen stiff before to-morrow."

His soul—that of a true explorer—revolted, not at the thought of death, but that his and Alden's courageously won discovery of a majestic mountain range towering high over a polar region marked "unexplored" on the maps would now never be made public.

Leaning forward against the merciless icy blast he painfully picked his way over a treacherous ice ridge, to be faintly encouraged by the fact that the towerlike hummock of ice marking the position of the plane now lay but a few hundred yards ahead.

Bitterly he cursed that demon of ill-fortune who had sent the blinding snow storm which had forced down the plane ten long days ago at the very beginning of its triumphant return flight to the base at Cape Richards. Since that hour the storm gods had emptied the vials of their wrath upon the luckless explorers. Day after day, cyclonic winds made all thought of a take-off suicidal in the extreme. Three days ago the last of their food had given out, and, he mused, starvation is an ill companion for despair.

Slip, slide and fall! On he fought until the final barrier was reached and he stood staring hopelessly down into a small natural amphitheater which sheltered the great monoplane. The ship was still there, its engine snuggled in a canvas shroud and with the soft, dry snow banked up high in the lee of its silver gray fuselage. Numbly, like a man in the grip of a painful

coma, Nelson shielded his face with a furry hand to scan the surrounding terrain. "Hell!" The door block of the igloo they had built was still snowed up; Alden was not there!

"He's not back," he muttered, while his body swayed beneath the gale which smote him with fierce, unseen fists. "Poor devil, I hope he hasn't lost the way."

All the bitterness of undeserved defeat stung his soul as he started down the incline into the hollow.

Suddenly he paused. The rifle flew into the ready position and his chilled thumb drew back the hammer. "What's this?" On the snow at his feet was a bright, scarlet splash, dreadfully distinct against the white background. While his dazed brain struggled to register what his eyes saw, he looked to the right and left and discovered several more of the hideous spots. Then an object that gleamed dully in the polar twilight attracted his attention. He lumbered forward, stooped stiffly and caught up a long, half round strip of bronze.

"What? Why? Oh—I'm crazy. I'm seeing things!" The pain in his empty stomach was now becoming excruciating. To steady himself he shut his eyes, shook his head as though to clear it, then looked again at that strip of metal in his hand. Attached to it were two slender strips of leather like straps, ending in small, bronze buckles.

"Why, it's not from the plane," he stammered aloud. "Damned if it doesn't look like a greave the old Greek warriors used to wear to protect their shins."

Suddenly alarmed and mystified beyond words, he shuffled forward over the snow, the greave yet clutched in a fur gloved hand. Presently two more objects, already half buried by the stinging, swirling drifts, caught his attention. One was the stock of Alden's rifle, protruding starkly brown from the unrelieved whiteness, and the other was a broken wooden shaft that ended a graceful but wickedly sharp bronze spear head.

"I've either gone crazy," he said, "or I'm delirious. Yes, I must be clean nutty! There *couldn't* be a human

settlement within a thousand miles. Let's see what's happened."

On the snow of a little wind-sheltered space behind the igloo he discovered the unmistakable and ominous signs of a struggle. An indefinite number of footprints, blurred but enormous in size, were marked in the snow. Here and there deep furrows mutely testified how Alden and the enemies against whom he struggled had reeled back and forth in vicious combat over a considerable area. Then, shaken by a new fear, he discovered Alden's left glove and a rag of some peculiar thick material that seemed to have a metallic finish. But what aroused his gravest fears were the numerous splashes of blood that here and there streaked the snow in gruesome relief.

Only a moment Nelson stood, shaken by the merciless wind, scanning the piece of bronzed armor between his gloved hands with a fresh interest. It was beautifully fashioned, and decorated at the knee point with the wonderfully wrought figure of a dolphin.

If he could only think clearly! But his brain seemed to

lie in a red-hot skull. "Whatever's happened," he muttered, "I'd better not waste time; they couldn't have been here so long ago. Poor Alden! I wonder what kind of devils caught him?"

Even before he had finished the sentence the aviator had taken up the partially obliterated trail of spattered blood drops. That what he sought appeared to be a marauding party of giants restrained him not at all. The one clear thought burning in his weary brain was that Richard Alden, his best friend—the man with whom he had traveled over half the world, by whose side he had faced many a perilous situation—must at that moment lie in peril, the extent of which he could only surmise.

"Must have been about a dozen of them," he said thickly. And, holding the Winchester ready, he commenced once more to plod on through the stinging sheets of wind-driven ice particles. More than once he had great difficulty in not losing that crimson trail, for here and there the restless, white crystals completely blotted out the splashes.

All at once Nelson checked his pathetically slow progress, finding himself on the top of an eminence, looking down in what appeared to be a vastly deep natural amphitheater of snow and ice. At the bottom, and perhaps a hundred yards distant, was a curious black oval from which appeared to rise a dense, wind-whipped column of whitish vapor.

"My eyes must be going back on me," muttered Nelson through stiffened lips. How intolerably heavy his fur suit seemed! His strength was about gone and that curious black mouthlike circle seemed infinitely far away. But, spurred by fears for his friend, he started downward for the precipitous trail leading directly towards it.

Once he stepped inside the crater, he became conscious of a terrific side pressure which gripped him as a whirlpool seizes a luckless swimmer. The wind buffeted him from all angles, dealing him powerful blows on face and body, which, too strong for his weary body, sent him reeling weakly, drunkenly across the hard, glare ice towards the vortex. Twice he slipped, each time finding it harder to arise. But at

last he approached what on closer inspection proved to be a subterranean vent of black rock.

"Steam!" he gasped. "It's steam coming out of there!"

Swayed by a dozen conflicting emotions, he paused, the Winchester barrel wavering like a reed in his enfeebled grasp.

"The whole thing's crazy," he decided. "I must be frozen and lying somewhere, delirious. Poor Dick! Can't help him much now."

Like a man in a nightmare who advances but feels nothing under his feet, Nelson staggered on towards that huge, gaping aperture of black rock. On the threshold a pool of melted snow water made him stare.

"Hell!" he said. "It's only a volcanic vent of some kind." Then dimly came the recollection of Eskimo legends concerning thermal springs beyond the desolate and unknown reaches of Grant Land.

His mind in an indescribable turmoil, Nelson splashed across a hundred yards of sodden snow, then shivered on wading knee deep through a pool of melted ice. Now he stood on the very threshold of that awful opening, dense clouds of vapor beating warmly against his chilled features.

His goggles fogged at once, blinding him effectively as, with reason staggering under the accumulated stress of starvation and the circumstances of Alden's disappearance, he groped his way a few feet into the vent. With his left hand he pulled up the glasses from his sunken, blood-shot eyes.

"It's warm, by God!" he cried in astonishment as the skin exposed by lifting the goggles came in contact with the air. "Must be some kind of earth-warmed cave."

Increasingly mystified, he caught up his rifle and strode on down the passage, at that moment illuminated by the last unearthly rays of the aurora borealis. A single, dazzling beam played before him like a powerful searchlight, to light a high vaulted

tunnel of basalt rocks which were distorted by some long-gone convulsion of the earth into a hundred weird cleavages and faults. For that brief instant he found he could see perhaps a hundred feet down into a high roofed passage, along the top of which poured a tremendous stream of billowing, writhing steam.

"If this doesn't beat all," he murmured; but for all of his apprehension he did not pause. Those bloody splashes bespeaking Alden's pressing need urged him on. "Looks like I'm taking a one way trip into Hell itself. Well, we'll soon see."

Slipping and sliding over an almost impassable array of black rocks and boulders, Nelson fought his way forward, conscious that with every stride the air grew damper and warmer. Soon trickles of sweat were pouring down over his chest, tickling unbearably.

Then all at once the ray of light faded, leaving him immersed in a blackness equalled only by the gloom of a subterranean vault. He stopped and, resting his rifle against a nearby invisible rock, threw back the parka hood and pulled off his gloves. He was amazed

to feel how warm the strong air current was on his hands.

"Beats all," he muttered heavily. "I wonder where they've taken Alden?"

Meanwhile his hands groped through fur garments now wet with melted-snow and ice particles, searching for the catch to open that pocket in which lay a small but powerful electric flashlight, an instrument without which no far-flying aviator finds himself. After a moment's fumbling, his yet stiffened fingers encountered the cylindrical flash and, with a low cry of satisfaction, he drew it forth to press the button.

"Mighty useful. I—" The words stopped, frozen on his lips. Before the parka edge his close cropped hair seemed to rise, and his breath stopped midway in his lungs. Sharp electric shocks shook him, for there, half revealed in the feeble flashlight's glare, was a sight which shook his sanity to the snapping point. Not fifty feet away two eyes, large as dinner plates, with narrow vertical red irises, were trained on him.

Rooted to the ground by the paralysis of utter horror, Nelson saw that their color was a weird, unhealthy, greenish white, rather like the color of a radio-light watch dial.

Strangely intense, these huge orbs wavered not at all, filling him with an unnameable dread, while the strong odor of musk assailed his nostrils. The flashlight slipped from between Nelson's fingers and, no longer having his thumb on the button, flickered out.

Helpless, Nelson stood transfixed against a boulder, aware that the strange, musky scent was becoming stronger. Then to his ears came a dry scrabbling as of some large body stealthily advancing. Those horrible, unearthly eyes were coming nearer! Fierce, terrible shocks of fear gripped the exhausted aviator. Then the impulse of self-preservation, that most elementary of all instincts, forced him to snatch up the rifle, to sight hastily, blindly, between those two, great greenish eyes. Choking out a strangled sob of desperation, Nelson made his trembling finger close over the cold strip of steel that must be the trigger.

Like a stage trick, the cavern was momentarily lit by a strong, orange yellow glare. Then the Winchester's report thundered and roared deafeningly; coincidentally arose a nerve-shattering scream. An exhalation, foul as a corpse long unburied, fanned his face. Terrified, he flattened to the rock wall as a huge, though dangerously agile body hurtled by with the speed of a runaway horse. Presently followed the sound of a ponderous fall, then a series of shrill, ear-piercing gibberings and squeakings, like those of a titanic rat—squeaks that rang like the chorus of Hell itself. Gradually they grew fainter, while in the darkness the heavy air of the tunnel became rank with the odor of clotting blood.

Nelson remained where he was, shaking like a frightened horse and bathed with a cold sweat.

"Wonder what it was?" he muttered numbly.

He broke off, for in the terrible darkness sounded a low but perfectly audible *thud! thud! thud! thud!*—and also the subtle noise of some rough surface rasping gently over the stone. His nerves crisped and

shrieked for relief.

"It's coming again!" he told himself, and ejected the spent cartridge from the Winchester. "No use—it'll get me, but I may as well fight as long as I can."

Even stronger grew the musty smell of blood while that uncanny *thud! thud!* sound continued at regular intervals. Nelson waited, breath halted and finger on trigger, but still the darkness yielded no glimpse of those awful saucer-like eyes.

Emboldened, he stooped and, jerking off his left glove, commenced to grope among the boulders. Somewhere near at his feet the flashlight must be lying. Hoping against hope that its fall had not shattered the bulb, he ran his fingers over the cold, damp stones, every instant expecting to feel the clutch of the unseen monster. How tiny, how puny he was! All at once his fingers encountered the smooth familiar shape of the flash and he raised it cautiously through the darkness. Patiently he shifted the Winchester to his left hand in order to set the flashlight on the top of a flat rock, pointing it as

nearly as he could determine in the direction from whence came those ominous, stealthy sounds.

"Guess I'll switch on the light," he decided, "and trust to drop whatever it is before it reaches me."

Taking a fresh grip on his quivering nerves, Nelson cautiously cocked the .38-55, cuddled the familiar stock to his shoulder. He sighted, then with his right hand pushed down the catch lever of the flashlight.

Instantly a dazzling white beam shot forth to shatter the gloom. The hair on the back of Nelson's hands itched unbearably, while the cold fingers of madness clutched at his brain, for the sight which met his eyes all but bereft him of his wavering sanity. There, belly up, across a low ridge of basalt, lay a hideous reptile, which in form faintly resembled an enormous and fantastic kangaroo. Its scabby belly was of the unhealthy yellow of a grub, a hue which gave way to a leaden gray as the wart-covered skin reached the back. Two enormous hind legs, each thick as a man's torso and each equipped with three dagger-like talons, struck out in helpless fury at the air, while a

long, lizard-like tail threshed powerfully back and forth, scattering ponderous boulders right and left as though they had been marbles. The flashlight being trained as it was, the monster's head and forequarters were invisible, all save two very much smaller and shorter front legs which, like the hinder ones, clawed spasmodically.

"The D. T's!" gasped Nelson, conscious that he was trembling like an aspen. He suppressed a wild desire to laugh. "Yes, I've gone crazy!"

He glanced downwards and leaped swiftly back, for, creeping over the stones towards his fur outer boots, meandered a wide rivulet of bright scarlet blood. From its surface rose small curling feathers of steam which, drifting towards the tunnel's roof, merged with that gray, vaporous current flowing steadily towards the sunless Arctic expanse outside.

It took Nelson a long five minutes to sufficiently recover his equilibrium for action. All he could do was to stare at that grotesque, gargoyle-like creature as it writhed in leisurely and persistent death throes.

"Guess I winged it all right! My God, what a nasty beast! Looks like one of those allosaurs I read about in college. It couldn't be, though—that tribe of dinosaurs died out five million years ago."

Cautiously he scrambled around among the high black stones, casting the search light beams before him and holding the Winchester always ready in his hand while trying to recall snatches of palaeontology studied at college long years ago.

"Yes, it must be a survival of one of the carnivorous dinosaurs," he decided, then paused, increasingly conscious of that steady thudding noise. What caused it?

At last he found himself before the creature's gigantic and repulsive head which lay limp over a blood bathed stone, huge jaws partially open, and serrated rows of wicked, stiletto-sharp teeth gleaming yellowly in the flashlight's rays. The head in shape was bullet-like, ending in a blunt nose as big as a bushel basket and in two prominent nostrils. The green, lidless eyes were still open, shining faintly, and seemed to follow

his movements, but the steaming blood poured with the force of a small hose from between triple row of bayonetlike teeth that curved inward like those of a shark, to splash and bubble freely to the rock floor and to dribble horribly over the warty, gray hide.

Then Nelson discovered an amazing fact. About the great scaly neck, thick as a boy's waist, was fastened a ponderous collar, set with short, sharp spikes.

Nelson gasped. "What in hell!" he cried. "This damn thing's somebody's property!" His mind, staggered at the thought of dealing with a race that could and would domesticate such a hideous monster. "Well, it's no use standing here," he muttered, wiping the sweat from his eyes. "This isn't getting poor Alden away from those devils."

Thud! thud! In the act of turning he paused, listened once more. Then he discovered to his amazement that the heart of the apparently dead reptile was still beating strongly. He could even see the yellow skin of its belly rise and fall. The effect was grotesque, uncanny.

"Of course," muttered the shaken aviator, "I'd forgotten a reptile's ganglions will keep on beating for hours, like that shark we killed off Paumotu. Its heart didn't stop for five hours."

Leaving the slain allosaurus behind, the aviator limped onwards, doggedly following a trail which wound down, ever onwards, into the depths of the earth. Gradually the air became so filled with steam that he stripped off his fur jumper and trousers. Clad in a khaki flannel shirt, serge trousers and shoepacks, he paused long enough to count his cartridges, and found there were just fourteen. Hell! Not very many with which to venture into an unknown abyss. He distributed them in his pockets, and, somewhat relieved of the weight of the fur suit, took up his advance, playing the flashlight ahead of him as he went.

"Poor Alden," he thought. "I wonder if he's still alive?"

Every moment expecting to stumble over the mangled corpse of his friend he hurried on, making better time over the cavern floor, but soon even the lighter

clothing commenced to feel oppressive.

"Must be the earth's heat," he muttered, while the steam clouds rolled by him like ghostly serpents.

"Guess the crust is very thin here—something like Yellowstone. Probably I'll find some thermal springs ahead."

Just as he spoke the tunnel took a sharp turn to the right. He scrambled around the bend to stand petrified, for with the suddenness of lightning a flood of dazzling orange-red light sprang into being.

Momentarily it blinded him, then revealed strange, incomprehensible scenes. It appeared that two short shafts of incandescent flame roared through transparent columns of glass on either side of the passage some fifty yards distant. Subconsciously Nelson realized that these columns began and ended in stonework that was smooth and well joined.

As his eyes became accustomed to the glare he distinguished beside each light pillar two bronze doors, some eight feet high and semicircular in shape. These had been evidently pulled back to expose the

lights. Then his breath stopped in his throat, for there, standing beside them, was a gleaming group of six or eight of the strangest creatures Nelson could ever have imagined. They were men—there was no mistaking that—men of normal size, but they were so helmeted and incased in a curious type of armor that for a moment he believed them gargoyles.

Quite motionless he stood, clutching the cold barrel of the Winchester in a spasmodic grip and staring up at those two watch-towers, built like gigantic swallows' nests into sheer rock wall. He could see the warriors stationed there, peering curiously down at him from the depths of heavy, bronze helmets—helmets which in shape much resembled those of an ancient Grecian hoplite, for the nose guards and cheek pieces descended so low as to completely mask the features of those strange guards. For crests these helmets bore exquisitely wrought bronze dolphins, with brilliant blue eyes of sapphire. But what fascinated Nelson most was the curious armor they wore. Beneath breast plates of polished bronze, these strange warriors wore what seemed to be a kind of chain mail—yet it was not that, for the texture had

more the appearance of some heavy but pliant leather, finished with a metallic surfacing.

Suddenly the spell of mutual amazement was broken, for a tall warrior in a breast plate that glittered with diamonds and seemed altogether more ornate than the rest, clapped a short brass horn to his lips and blew a single piercing note. At once there appeared on the tunnel's floor, not a hundred yards from the startled aviator, a rank of perhaps twenty soldiers, accoutred exactly like those he beheld by the light boxes. They came scrambling over the boulders, their shadows grotesquely preceding them. In their hands were long shafted spears, and on their left arms rectangular shields, charged with a lively dolphin in the act of swimming. Some of them, however, held short hoses in their hands, hoses that sprouted from tight brass coils strapped to their broad shoulders.

Again the commanding figure aloft raised the horn. From the tail of his eye Nelson caught the gleam of metal in the orange glare. While a blast, harsh as the scream of a fire siren, echoed and re-echoed eerily through the passage, there appeared a fresh

detachment. Nelson shrank back in horror, for these bronze-armored warriors led, at the end of a powerful chain, two more of those huge, ferocious allosaurs, exactly like the one he had slain but a short while back.

Like well regulated automatons the hoplite rank opened to permit the passage of those repulsive, eager monsters, then closed up again and halted, spears levelled before them in the precise manner of an ancient Grecian phalanx, while the men with those curious hose-like contrivances ran out to guard the flanks.

"I'm done for now," thought Nelson as he threw off the Winchester's safety catch. "I suppose they'll turn those nightmares loose on me."

He was right. For all the world as though they led war dogs, the keepers in brazen armor advanced, the dull metallic clank of their accoutrement clearly discernible above the sibilant hiss of their hideous charges, which hopped along grotesquely like kangaroos, using their long and powerful tails as a

counterpoise.

Then the officer watching from the left hand swallow's nest shouted a hoarse, unintelligible command, whereupon one of the keepers raised his right hand in a sharp gesture that instantly flattened the incredible monster to earth, exactly like an obedient bird dog.

As in a fantastic dream Nelson watched one of the armored guardians unsnap the hook of the powerful chain by which his allosaurus was secured. Then, whistling sharply, he clapped his hands and pointed straight at the motionless aviator. The creature's green white eyes flickered back and forth, and a chill, colder than the outer Arctic, invaded Nelson's breast as those unearthly eyes came to rest upon him.

Meanwhile the other allosaurus remained crouched, whining impatiently for its keepers to cast it loose.

Fixing burning eyes upon the American, the foremost keeper threw back his head. "Ahre-e-e!" he shouted. Instantly the freed allosaurus arose, balanced its

enormous bulk, then commenced to leap forward at tremendous speed, clearing fifteen or twenty feet with each jump and uttering a curious, whistling scream as it bore down, a terrifying vision of gleaming teeth and talons.

Shaking off the paralysis of despair, Nelson whipped up the Winchester and, as before, sighted squarely between those blazing, gemlike eyes. When the huge monster was but twenty feet away he fired, and the report thundered and banged in the cavern like the crash of a summer storm. In mid-air the ghastly carnivore teemed to stagger. Its tail twitched sharply as in an effort to recover its balance. Then, quite like any normal creature that is shot through the head, it lost all sense of direction and made great convulsive leaps, around and around, clawing madly at the air, bumping into the rock walls and uttering soul-shaking shrieks of agony. Like a gargoyle gone mad it reeled back towards the startled rank of spearmen. As it came, Nelson saw the second allosaurus rear itself backwards and, balanced on its tail, strike out with powerful hind legs as its maddened fellow drew near.

Like razors the great talons ripped through the dying allosaurus' belly, exposing the gray-red intestines as the stricken creature raced by, snapping crazily at the empty air.

A single mighty sweep of the monster's tail crushed five or six of the panic-stricken keepers and guards, strewn like broken and abandoned marionettes among the stones. Hissing and obviously terrified, the second dinosaur watched the dying struggles of its mate; then, obedient to a terrified shout from its keepers, wheeled about to join in a frantic rout of the spearmen, who, casting aside shield, spear and brass coil, fled for dear life in the direction of those invisible passages through which they had appeared.

Chapter 2

No less amazed and alarmed than those vanished soldiers, Nelson remained rooted to the ground, conscious that in the swallow's nest overhead there remained only the officer—a tall, broad shouldered man with golden beard showing from under the cheek pieces of his helmet. Across the body of the still writhing monster their glances met. Nelson could see by the light of those strange pillars of fire that the other's eyes were blue as any Norseman's. Leaning far out over the stone parapet the other stared down upon the aviator from the depths of his jewelled helmet in a strange mixture of curiosity and awe.

Suddenly Nelson's nerves snapped and he shook a trembling fist at the martial figure above.

"Go away!" he shrieked, and reeled back on the edge of collapse. "Go away, you damn phantom! You're driving me crazy—crazy, I tell you!"

The other stiffened, then turned and, uttering a hoarse shout, vanished, leaving the noiseless and

apparently heatless pillar of fire flaring steadily.

Recovering somewhat, Nelson set his teeth, advanced to the nearest corpse, stooped and regarded him who lay there, with bronze helmet fallen off.

"It's a man and not a ghost," he murmured as his finger encountered flesh that was still warm. "Red headed too, or I'm a liar. Now what in hell is all this?"

For all his bewilderment he began to feel better and his swaying reason became steadier. "Bronze, bronze—nothing but bronze," the aviator told himself as he further examined the scattered equipment. "Evidently these fellows don't know the use of iron or steel."

With increased curiosity he bent over another splendidly built dead man who lay with back broken and sightless eyes staring fixedly onto the steam current meandering silently along the cavern's roof. From the fallen man's belt were slung half a dozen curious weapons that looked not unlike potato mashers, except that they were bronze headed and had wooden handles.

"Hum," he commented, "kind of like the grenades the Boche used in the late lamented. Wonder what the devil these are?"

Suddenly his ear detected the sound of a footstep and, on looking swiftly up, he beheld that same yellow bearded officer who had directed the attack. This strange being had taken off his ponderous helmet to carry it in his left hand, while his right was held vertically in the immemorial sign of peace. On he came with powerful martial strides, a brilliant green cloak flapping gently behind him and the jewels in his brazen armor glinting like so many tiny colored eyes. The stranger was indeed handsome, Nelson noticed—and then he received perhaps the greatest shock of the whole chimerical adventure. The gold bearded man halted some twenty feet away, smiled and spoke in a curiously inflected but perfectly recognizable voice.

"Welcome to the Empire of the Atlans. Prithee, Wanderer, what be thy name?"

For a long moment Nelson was entirely too taken

back to make a reply. Desperately his already perplexed brain tried to comprehend. Here was a handsome six-footer, dressed in the arms of an ancient race, speaking English of the seventeenth century!

As at a phantom, he regarded the stalwart, faintly ominous figure, from heavy leather sandals to bronze greaves, thence to wide belt from which dangled more of those curious grenadelike objects. His glance paused on the officer's beautifully wrought bronze cuirasse or breast plate which showed in relief an emerald scaled dolphin and trident. These, Nelson decided, must be the national emblems of this incomprehensible nation.

Then their eyes met, held each other a long moment until the tall officer's features, disfigured by a long red scar across the jaw, broke into a hard smile.

"Hero Giles Hudson begs thy pardon," he said, "but methought thou spoke in the language of Sir Henry Hudson, my ancestor?"

"Sir Henry Hudson!" stammered Nelson incredulously. "The old explorer whose men turned him adrift? So that's why you're talking embalmed English!" In desperation his weary brain strove to understand.

"I know naught," replied the other with a grave smile, "save that the founder of our royal line spoke what he called English. He came from the Ice World to rule wisely over Atlans. He was the greatest Atlantean of history."

"Atlantean?" echoed Nelson, while his mind groped frantically in the recess of his memory. "Atlans, Atlantis!" A great light broke upon him. "The lost Atlantis! Great God!" Had he stumbled upon a remnant of that powerful people whose fabled empire had been drowned ten centuries ago in the cold waves of the Atlantic?

"Aye," the yellow haired warrior continued as though reading his thoughts, "long centuries ago this valley was peopled by those who escaped the great cataclysm which ended the mother country. Later

came another race, barbarian wanderers like thyself." He bowed for all the world like a courtly English gentleman. "But methinks thou art in need of food and sustenance?"

"You bet I'm hungry," was Nelson's emphatic reply. "I'm one short jump of starvation and the D. T.'s. But hold on a minute," he cried. "I'm looking for a friend of mine. He went by here, didn't he?"

"Aye." A crafty expression Nelson did not like crept into Hero Giles Hudson's face as he solemnly inclined his head.

"For the nonce, fair sir, thy companion is hale and sound. I beg your patience."

With a quick gesture the Atlantean raised his dolphin-shaped horn and blew three short blasts while Nelson, in sudden alarm, cocked his rifle and brought it in line with the other's chest. The glittering officer saw the motion, but made no effort to move from the line of sights.

"Thy gesture avails naught," said he with stiff courtesy. "When Hero Giles gives his word, it stands good though Heliopolis and the Empire of the Atlans fall."

One by one half a dozen spearmen appeared, all obviously very frightened and only moved by an apparently Spartan discipline. Promptly they saluted, whereupon the Hero—as his title appeared to be—uttered a number of brief commands in some guttural language entirely unintelligible to the dazed aviator.

Presently a strange column appeared, composed of some fifteen or twenty disarmed men marching between a double rank of heavily equipped hoplites. As they drew near, they clasped imploring hands and evidently begged for mercy from the stern, tight jawed figure at Nelson's side. Contemptuous and unhearing the prisoners' piteous pleadings and lamentations, Hero Giles scowled upon them and deliberately turned his back.

"What are they?" inquired Nelson, vaguely alarmed.
"Enemies?"

"Yes." There was a certain bitter savagery in the speaker's voice. "These are the dauntless defenders of Atlans who ran at the report of thy weapon. Presently they die."

It was useless to interfere. The horrified aviator knew it and watched with compassionate eyes while the condemned soldiers were ranged in a single, white faced line. They remained silent now, seeming to have found courage now that hope was dead.

Upon brief command from a subaltern, the guards wheeled about and retreated perhaps twenty yards down the passage. There they halted, glittering eyes peering through the slots in their helmets to fix themselves upon the rigid prisoners who stood numbly resigned to death.

With surprising speed each member of that weird firing squad detached a brazen grenade from his belt, then threw back his arm in exactly the same attitude as a bomb-throwing doughboy. Then there came a short, sharp command and some fifteen or twenty grenades bobbed through the air to crash on the

stones at the feet of the victims.

His head swimming with repulsion at the slaughter, Nelson beheld a curious sight. It seemed that from the broken grenades appeared a yellowish green vapor which sprung *of its own accord* upon the silent upright rank! In an instant it settled like falling snow upon the doomed soldiers. For a breathless fraction of a second they stood, eyes wide with horror, then collapsed, kicking and struggling as men do under the influence of gas.

"Horrible!" gasped Nelson. "What was in the bombs?"

"A vapor," explained Hero Giles shortly. "A fungus vapor which, falling upon exposed flesh, instantly invades the blood and multiplies by millions. See—" He pointed to the nearest dead man and Nelson, with starting eyes, watched a yellowish growth commencing to sprout from the dead man's nostrils. Swiftly the poisonous mould threw out tiny branches, spreading with astounding rapidity over the skin until, in less than a minute after the grenades had exploded, the whole tumbled heap of dead were

covered with a horrible yellow green fungus growth.

"Thou seest?" Hero Giles demanded. "Powerful, is it not? It is against the fungus vapor we wear this body armor made from the skin of a small lizard which inhabits our mountains."

Shocked and appalled, Nelson watched the retreat of the solemn, silent execution party.

Other soldiers fell to unconcernedly stripping their fallen comrades of equipment; then, to Nelson's horrified surprise, two hideous allosauri reappeared, shepherded by some six or eight keepers. Once the horrible creatures were released, they pounced upon the dead and, snarling horribly, commenced to rend and devour the corpses.

Too shaken to comment or to make the protest he knew to be futile, Nelson followed the stalwart English-speaking officer into a bronze door set in the cavern wall and up a short flight of stairs into what appeared to be a guard room, where food and wine were immediately set before the famished aviator.

"Yea," Hero Giles was saying as he set down a beautiful goblet and wiped the last traces of wine from his beard, "we will soon o'ertake thy friend. He was but little hurt, and thou wilt assuredly join him in judgment before our great Emperor, Altorius XXII, at Heliopolis, our capital."

"Heliopolis?" mumbled Nelson, his mouth full of delicious stew that seemed to be made of veal.

"Heliopolis? How far away is it?"

"A hundred leagues more or less," the other smiled.

"Almost a third of the distance up this great valley."

"One hundred leagues! Three hundred miles! Then we won't be there for several days."

The Hero's deep, rather ominous laughter rang out in the little rock hewn chamber. "Days?" he jeered.

"Days? Art thou mad? In two hours from the time we board the tube-road thou shalt learn thy fate from his Serene Highness."

"What!" Nelson's sunken and blood-shot gray eyes

widened, while his jaw dropped incredulously. "One hundred leagues in two hours? As I remember there are about three miles to a league, so a hundred leagues in two hours means one hundred and fifty miles an hour! Why, that's utterly impossible! The Twentieth Century Limited doesn't go half so fast."

Several enormous emeralds set into the other's bronze cuirasse glittered softly and the Hero's cold blue eyes hardened as his hand sought the grenade belt.

"Impossible? Dost doubt my words, sirrah?" With an effort he controlled himself. "Nay, thou shalt see for thyself ere long. The tube-road runs from Heracles to Heliopolis. Thou canst trace its course on this map here on the wall."

"The dog-born devils of Jarmuth have no such means of travel," continued the Atlantean, with a touch of smug pride that reminded Nelson of a small town Middle Westerner speaking of the "rightest, tightest little town west of the Mississippi."

Nelson found it extremely weird to be sitting there in a heavy arm chair, drinking good red wine with a fierce armor-clad warrior who wore sandals, sword and a war cloak such as might have graced the limbs of Alexander of Macedon. But with the food and rich warm wine, he felt blood, strength and self-confidence pouring back into his weary body. "Jarmuth?" he inquired. "What is Jarmuth?"

At his question the domineering, predatory face across the table darkened and the scar on his cheek flamed red as a scowl of hatred gripped Hero Giles' visage.

"Jarmuth!" snarled the Hero, and his great hand closed like a vise. "Jarmuth! A nation of treacherous, gold-adoring cannibals, whose countless hordes, spawned in the hot lowlands, ever threaten our frontiers. I tell thee, Friend Nelson, the dog-sired Jereboam will not rest until mighty Heliopolis lies in a heap of smoking ashes."

"Evidently," thought Nelson, taken aback at the other's vehemence, "this lad's English only in speech."

I guess he's all Atlantean outside of that."

Warming to a fiercer pitch, the other fixed his guest with a smoldering gaze. "Jarmuth lies beyond Apidanus, the boiling river, and is the home of a savage horde whose horrid rites in Jezreel, the capital, stink as an offense to Saturn and the High Gods! Why, mark you," the warrior prince continued, interrupting his tirade to gulp a goblet of wine, "five years ago, by treachery, they seized the beauteous Altara, sister of our gracious Emperor, and upon the annual feast of Beelzebub, that vile demon they worship, the dark dogs would have sacrificed and devoured her, according to their rites, had not our Emperor dispatched a ransom of six fair maidens to take her place.

"Every year since then Jereboam has exacted that same tribute. Every year their princes and priests gorge themselves on the tender white flesh of our fairest and noblest maidens. But this tribute must end! The augurs have told us so. Help will come from the Ice World." Hero Giles brought crashing down on the table a brawny fist, on whose wrist was fixed a

bright, gem-studded bracelet.

Horror-stricken, Nelson nodded.

"It is for this alone," continued the Hero somberly,
"that thy life and that of thy friend have been spared."

"So? I didn't notice," broke in Nelson, "that you particularly went out of your way to preserve my health a while back."

The heavy golden head shook slowly and a grim smile played about those thin cruel lips. "Nay, but I could have had thee slain. Come, as we go to the tube-road I'll show thee how much thou liest in the hollow of this, my hand." He thrust out a broad, powerful palm. "Forget not, fair sir. At any moment I or my Imperial Master may choose to close that hand."

"Perhaps!" stated Nelson, feeling it imperative to keep up his pose of independence. "But it might just happen that your hand would close on a porcupine, and so far from hurting the porcupine it would be your hand that would be hurt."

"Sirrah!" The Atlantean sprang to his feet and one hand shot to the grip of his ponderous, bronze sword; but even more quickly Nelson snatched up his rifle, a thin smile playing on his lips.

"Drop it," he snapped. "Control yourself, or I'll plug you like that allosaur. Be reasonable, can't you? We both want something, and perhaps can help each other gain it."

The taut, menacing figure in armor relaxed and, with a gentle clank of accoutrement, Hero Giles resumed his seat.

"Prithee pardon me," he apologized ungraciously. "I was ever a hot-head and there is much in what thou sayest. We wish to force an end to this annual tribute—if not to regain our beloved Altara. And thou"—his heavy, golden eyebrows shot up—"and thou, what dost thou wish?"

Nelson lowered the menacing barrel. "I want the return of Richard Alden, free passage back to that spot where he was captured and plenty of food and

help should we need it. If I aid you in one, you must promise me in the other."

"Aye," returned the other doubtfully. "But I myself can pledge naught save thy immediate safety. 'Tis for our Imperial Majesty to say whether both thou and thy friend shall live, or whether ye shall feed our war dogs. Come now, we must go to Heliopolis."

Map of Jarmuth and Atlans

Picking up his heavy, bronze helmet the Atlantean prince set it on his yellow head and waited impatiently for Nelson to drain the last of his wine.

Then, with a swirl of his green cloak, he vanished through the rock wall, closely followed by a singularly distracted and alarmed aviator.

Chapter 3

A bright yellow glare steadily increased to mark the end of the tunnel down which the two had progressed; then, with the sharp abruptness of a hand-clap, there resounded a loud challenge in that unintelligible Atlantean language, above which the hiss of steam could be loudly heard.

Instantly the Atlantean prince strode forward, a commanding figure. Momentarily his helmet and the dangling grenadelike bombs were sharply outlined against that unearthly yellow light. He raised his hand and dropped it, palm outward, to his chin in what must have been a salute. The hissing sound of steam then faded into silence.

Followed at a respectful distance by a pair of silent, bronze-helmeted hoplites, Nelson and his guide descended a narrow stair, which broadened at the base. It was a very long staircase composed of perhaps two or three hundred steps which were occasionally interrupted by wide stone terraces. On these level spaces were fixed what appeared to be

enormous field guns of glittering brass. They were similar, yet somehow oddly dissimilar, to the great guns Nelson had seen in France.

"Behold, oh Wanderer," Hero Giles declaimed impressively, "the lands of Atlans and Jarmuth!"

It was a weird landscape that met Nelson's half-unbelieving gaze, a landscape green with that brilliance peculiar to spring meadows, lying beneath the same deep blue sky that overarched the surrounding barren ice fields which hemmed in this astounding valley.

A slight smile played over Hero Giles' thin lips as he watched the amazed aviator.

"The splendor of our country must indeed astound thee," he observed, "having come from the dreary fastness of the outer Ice World. But come; we are now to pass the great retortii guarding the entrance into the valley."

Nelson's eyes turned again to the weapons that so

oddly resembled field guns. He examined them closely, inspecting them narrowly for the differences he knew must exist between them and the artillery that had thundered during the War of the Nations.

The chief difference lay in the mounting of these starkly beautiful weapons. They seemed to be fixed on a movable pivot set into the coal black rock itself. Like modern artillery, these curious pieces of ordnance bore a bronze shield to protect their crews, through which projected the long and very narrow barrels of the guns. Grouped like cannoneers about their piece stood various red-crested Atlantean artillerymen. At a glance Nelson recognized the difference in their equipment from that of the spearmen behind them. These former bore no shields, no swords or bombs, but wore that same kind of leather body-armor which graced the powerful limbs of Hero Giles. Their helmets, too, were different: only the dolphin crest with a tuft of red feathers spouting from it bore any resemblance to those of the infantry, and, moreover, the artillerymen's eyes were shielded by goggles with thick blue lenses.

As the Hero approached, officers among them saluted, then sank on one knee with head humbly bent.

"Rather odd looking guns," commented Nelson. "I'm not much of an artilleryman, but I'm wondering how you take up the recoil?"

The Atlantean's laugh, which always reminded his guest of the purr of a tiger, rang out. "Why, marry, good sir, there is no recoil! These guns do not use that powder which Sir Henry, founder of our line, did speak of. Thou wouldst see one fired?"

His curiosity immeasurably piqued, Nelson nodded, whereupon the Atlantean wheeled about and barked a brief command. With truly Prussian precision, the artillerymen sprang to their posts, some to a series of levers which sprouted from the rock platform without any apparent connection, and some to wheels and gauges of varying size that clustered in bewildering intricacy about the breech of the great brass gun.

"Markest thou that tree yonder, on the ledge of the

valley?" The Atlantean's blunt outstretched finger indicated a towering pine sprouting from among a mass of reddish volcanic rock at the rim of that new world.

"Yes, I see it, but—" Nelson was astounded. A pine tree in the upper Arctic! That alone was sufficient cause for amazement. From a stiff red-plumed gun captain issued a brief series of commands which set the wonderfully drilled crew to silently adjusting their training and elevating mechanism. Click! Clack! Sis-s-s-s!

All up and down the vast staircase other gun crews stood watching. Nelson saw their weird, bluish goggles raised to that platform where, for all the world like a coast defense howitzer, the great cannon swung majestically about on the ponderous, brazen column which seemed to support it. Gradually the muzzle was elevated, then traversed a few feet, to finally come to a halt.

"Jakul, a Hero!" shouted the gun captain, his hand raised to Hero Giles.

"Thou art ready, Friend Nelson?" he inquired in tolerant amusement. "Mark well yon pine tree!

"Storr!"

Nelson saw one of the armored cannoneers bend forward, firmly grasp a short lever with both hands. In anticipation of a terrific report, the aviator pressed finger tips to his ears. There followed not a thundering crash, but a curious, eery, high-pitched scream, rather like that of a fire siren. There was no smoke! Nelson's incredulous eyes sought the muzzle of the gun and detected issuing from it what appeared to be a thin, white rod. This shimmering stream of silver shot straight towards the pine tree, gradually widening and giving off feathery billows of steam. In a fraction of a moment the target was completely veiled from sight in a furious pall of clouds which, to Nelson's great astonishment, did not dissipate nor condense with the speed of ordinary steam.

"Nava!"

With impressive suddenness the screaming sound

faded, leaving a sort of stunned silence on the gun platform. The gunners stalked back to their original stations.

Slowly, reluctantly, the mist enveloping the pine tree cleared away and Nelson felt a chill creeping up his spine. The pine was a good three hundred yards away, yet now it sagged limp to earth, stripped of bark, twigs and needles, only the bright yellow trunk and major branches remaining.

"That tree was a good two feet thick," mused the astounded aviator, "yet the steam gun bent it like a sapling. My God! What would it do to a man?"

"What thinkest thou of our retortii?" The Atlantean's beard glinted like metal as he shook with a grim, silent laughter. "These great retortii can shoot half a league and will blast any living thing in their path. I tell thee, friend Nelson, the discharge of even a small retortii will strip the flesh from a man's bones as a peasant strips the husk from an ear of corn!"

"Fearful, terrible!" was Nelson's awed comment. "Is

there no defence against them?"

"Of course." The Hero's green feather-crested helmet gleamed with a nod. "Was there ever an instrument of war that had not its defence? Yea, we have the blue vapor to shatter steam particles—it is called the blue maxima. Thou wilt presently see some of our troops armed with it."

"But where does this steam come from? How is it generated?" These two were the first of a host of questions which trembled on Nelson's lips.

"The steam," replied the Atlantean, "comes from the earth. We compress it many times, then feed it into our retortii. Without the heat of Mother Earth and our flame suns we would all perish. Steam is our motive power, our defence and our enemy!"

He flung his hand towards the vast valley stretched before them. It was hemmed in on either side by colossal breath-taking mountain ranges, whose caps shone and glittered with an eternal snow.

"Some foothills! They must rise all of 25,000 feet from the valley floor," decided the aviator, "and I should imagine this valley is a good mile below sea level. Yes! That must be it: this nightmare country lies in a huge geographical fault—something like the Dead Sea."

Mile after mile he could see fertile green land stretching away toward some low undulating hills on the horizon. Atlans was very thickly settled—that he recognized at once—for the terrain was divided and sub-divided into a vast checker-board, such as he had seen in France and Germany, while terraces, green with produce, had been laboriously gouged out of the frowning mountain sides.

Then his eye encountered the source of that curious amber light which pervaded the whole valley. A titanic flaming gas vent spouted like a cyclopean torch from the peak of a nearby mountain. Its steady, subdued roar struck Nelson's ear as he turned away his eyes, for the glare was too intense to be long endured. Further down the valley were two more such incandescent vents, shooting their flaming tongues boldly into the sky, warming the air and casting that

rich, amber radiance over all.

"That is Mount Ossa nearest us," the Atlantean's voice came as though from a long distance. Victor Nelson was too staggered, too unspeakably amazed to register the fact of the Hero's proximity. "Below are Pelion and Jilboa, which, with Jabor, the greatest of all the flames, illuminate and warm the valley."

Nelson's eye, trained to be all observant, ranged far and wide, noting the presence of many lacy, frothing geysers which spouted at varying intervals. There were, also, many steaming ponds and waterfalls which sprang in smoky confusion from the rock palisades to either side.

Nearer at hand he could distinguish a number of huge stone structures, evidently forts and public buildings. Strategically placed all about were more of those terrible brass retortii, gleaming dully under the incandescent glare of the flame sun.

"Come," cried Hero Giles with an impatient gesture of his hand, "we must e'en hasten to the tube-road

terminal. Word has long since been sent to Heliopolis of thy arrival."

Downwards into the valley, which grew ever warmer and more fertile, the Atlantean led on, explaining a thousand and one details to the astounded aviator. Presently they approached the nearest of the great stone structures and Nelson received yet another shock. In a courtyard was drilling what would correspond to a troop of cavalry in the outer world. In orderly ranks the troopers wheeled, marched and counter-marched, their brazen armor twinkling and clashing softly as they carried out their evolutions with an amazing precision. But what astonished Nelson was the fact that each of these strange troopers bestrode a lithe, long-limbed variety of dinosaur, a good half smaller than the allosauri he had encountered in the tunnel. These agile creatures ran about on their hind legs with astonishing speed, using a long reptilian tail as a balance.

On the back of each trooper was fastened a compact circular copper tank, from which sprouted a flexible metal hose that ended in what looked like a

ponderous type of pistol.

In distinction to the red of the artillerymen and the blue of the Hoplites, these curious cavalrymen wore brilliant crests of yellow feathers, and from their lance tips fluttered tiny pennons of that same color.

"They must travel at least as fast as a race horse," decided the aviator after studying the swift evolutions of the scaly chargers. To his ears came the curious dry scrape and rattle of their horny claws on the stone pavement of the drill yard.

He would have lingered to see more, for those grotesque, lizard-like chargers interested him immensely, but Hero Giles beckoned imperiously. So, dropping the Winchester to the hollow of his arm, Nelson followed him into the brilliantly gas-lit depths of the great structure.

Everywhere were red bearded, white skinned soldiers, staring at him with the frank curiosity of children. Powerful, magnificently built fellows they were, all in uniforms of different designs.

The walls about him, Nelson noticed, were covered with really beautiful friezes depicting various warlike scenes in that pure beauty of proportion found only in ancient Grecian temples.

On and on through resounding tunnels, past busy markets and barracks, hurried the two travelers. Then the Atlantean halted before a gracefully arched doorway where stood two hoplites, who immediately lowered spears to bar the passage. At a word from Hero Giles, however, they saluted and fell back in position—immovable, grim guardians.

Inside was a short staircase, beautifully wrought of bronze. Up this flashed the Atlantean's mail-clad body; then he came to a halt under the direct rays of a blinding light.

Nelson, on arriving above, discovered that the chamber was lined with jointless brass about ten feet high and circular in shape. "What's this?" he demanded curiously.

"The terminal of the tube-road. In a moment thou

shalt see the great cylinder arrive."

The words were hardly by the Hero's lips when there appeared, noiselessly and amid a great rush of air, a huge metal cylinder that ran upon a sort of truck. It rumbled up to the edge of the platform and from its end a small door was opened.

Hero Giles exchanged a few sentences with an elderly man who appeared to act as control master, then he indicated the glowing doorway of the cylinder.

Firmly clutching his Winchester, Nelson bowed his head and stepped inside, there to discover a luxury he had never anticipated. The interior of the cylinder was brilliantly lit and on both sides were ranged wide divans, strewn with many silken cushions. In a rack nearby were several graceful glass amphora, filled with red and tawny wine.

"The cylinder must be about thirty feet long," the marvelling American told himself, "and about ten feet in diameter. Guess it works on the same principle as the compressed air tubes the department stores use

to send change with."

Gingerly he tested the nearest divan and marvelled at the curious softness of what appeared to be a gigantic tiger skin. Meanwhile Hero Giles entered, his stern features even more serious, but with him was a younger man who resembled him not a little.

"Fair brother," said the Atlantean to his companion, "this is he of whom I spoke. Friend Nelson, this is Hero John, my next youngest brother—he, too, speaks the language of the great Sir Henry Hudson."

The metallic clang of the door being shut brought a sharp qualm to Nelson's heart. "What are they doing?" he demanded quickly.

"The menials bolt the door beyond," explained Hero Giles with amused gravity. "In a moment our cylinder will be placed in the dispatching chamber, where steam pressure will be exerted. We shall then be hurled through this vacuum tube-road to Heliopolis, greatest city of Atlans. In an hour we will be there."

Outside sounded the sudden insistent clangor of a gong, and immediately the hiss of steam grew louder. The car shuddered as the hissing rose to an eery scream, then all at once the cylinder leaped forward, nearly hurling Nelson from his seat. He struggled as best he might to gain his equilibrium, for the eyes of the others were on him.

Then, more smoothly, the great cylinder gathered speed and hurtled on through the darkness of the tube-road towards Heliopolis, where Victor Nelson would read the book of Fate.

Chapter 4

On the arrival platform at Heliopolis reigned a fierce excitement. Nelson noted countless armed and unarmed warriors hurrying to and fro, desperately intent on reaching their various posts, and snarling ill-temperedly as they elbowed their fellows aside. As soon as they appeared, Hero Giles and his brother became the center of an excited press of gorgeously armored officers.

"Hum!" murmured the aviator under his breath.

"Something's happened. Must be a revolution, an earthquake or a Democratic convention in town; these boys seem all steamed up."

Intently he studied the ring of fierce, red bearded faces surrounding his late hosts and gathered that indeed some event of overwhelming importance had taken place. Presently a splendid falcon-eyed old man in a yellow cloak strode up, struggling to control himself. His resemblance to the two Heroes struck Nelson immediately.

"Harken ye," he cried, in that Elizabethan English which appeared to be the hieratic language of the New Atlantis' rulers. "Have ye heard? The dog-conceived sons of Semites have broken the truce! But three measures gone by, a brigade of their mounted podokesons swooped down on this very suburb of Tricca, yea, to the very gates of Heliopolis! The foul man-eating dogs slaughtered royal serfs and burnt two quarters of the suburb to the ground! Moreover, they seized that prisoner"—Nelson's heart gave a great leap at the word—"whom thou sentest from the mountain passes."

"What!" In two swift strides Nelson was before the gray beard, his blood-shot eyes blazing with a strange light. "What did you say about that prisoner?"

The old man, who had obviously not noticed Nelson's presence, was thunderstruck to hear him speak in English until Hero Giles briefly explained his presence.

"Yea!" continued the elder, flinging lamentations furiously over his shoulder, "these swine of the Lost

Tribes captured him and slew his escort. They have retreated towards the Apidanus, slaying, burning and pillaging as they go."

A sickening, deadly fear gripped the weary aviator. This was too much! Bad as it was to have Richard Alden captured by these weird descendants of a long vanished race, it was far worse to have him fall into the hands of their deadly enemies, the Jarmuthians, decadent survivors of Israel's Five Lost Tribes. The possibility of a rescue now seemed hopelessly and crushingly vague and distant. What could he do now?

In dread despair he glanced about, amazed at the prodigious numbers of scowling men who hurried by, obviously intent upon the commencement of a campaign for revenge.

Then Hero Giles turned his scarred, warlike face, now set in granite lines. "Come, Friend Nelson, my uncle Anthony bids me take thee direct to the presence of His Serene Splendor, where he lies encamped at Cierum, by the shores of Lake Copias. There he marshals the army of Atlans for a march through the

hot country on Jezreel. I tell thee, thou hast come in stirring times. From Heraclea, Thebes, Ys and Mayda will come the Phalanxes. Once and forever we will deal the dogs of Jarmuth a final blow."

Victor Nelson never forgot the hours that followed. Issuing at a fast trot from the tube-road terminal, the two Heroes led the way to a vast structure, in which were stabled both the terrific allosauri and the podokesauri, those swift dinosaurs which seemed to serve the Atlanteans as horses. The dreadful hiss and snarl of these monsters resounded in his ears long before the stables came in sight, and that curious musky odor he had noted in the tunnel was sickeningly strong.

Everywhere he read signs of hurried preparations for war. Savage, surly allosauri were led from their stables, one by one, long necks writhing snakelike backwards and forwards. Then their keepers would, after a moment's tussle, secure huge leather muzzles over their gaping jaws, and the huge reptiles would be led waddling along on their hind legs out into a vast courtyard, there to hiss and strike at their

nearest fellows.

"Thinkest thou couldst ride a podoko?" inquired Hero John, an anxious look on his handsome, friendly features. "They are difficult to manage—but swift in flight as the birds themselves!"

"I don't know," replied the aviator, "but I'm damn well going to try. If your Emperor can help me rescue Alden, the sooner we get started, the better."

For all his brave resolutions, his heart sank, as the green kilted keeper led forth three podokesauri. Nelson stared curiously at them as, hopping along, they drew near, to bare needle-sharp teeth at him while, brazen stirrups on either side jangled softly against their rough, scaly hides.

In evident high spirits the beasts snuffed the air and pawed with their tiny front legs excitedly, making their sharp talons glisten like polished steel. A bridle dangled from the mouth of each and a ring set in the thick upper lip served as a further means of control.

At a sharp "*Oya!*" from an old and toothless keeper, the first podoko sank flat to the stone floor like a kneeling camel.

"A sturdy beast," commented Hero Giles, tightening his belt and securing the clasps to the emerald-green war cloak. "Here, Friend Nelson, thou hadst best don a helmet; the podokos on occasion throw back their heads and so might wound thee." So saying, he set foot in stirrup and swung up into a saddle which was built up high in the cantle to correct the sharp downward slope of the reptile's muscular back.

At a signal, Hero Giles' ugly mount rose to its height and shuffled awkwardly sidewise, as the old keeper, his eyes very wide and curious, led forward Nelson's charger.

"Look," said Hero John with a reassuring smile. "The chin strap buckles so—be sure it fits snug, else it will pound on thy head to the podoko's stride. If thou wouldst turn to the left, pull the rein so, to the right so, and if thou wouldst stop, pull strongly on the nose ring; 'tis not so difficult." He laid a friendly hand on

Nelson's flannel clad shoulder. "How wilt thou manage thy curious weapon?" he inquired doubtfully. "Perhaps thou hadst best leave it behind."

There was a grim smile on Nelson's weary and wind burned features. "Not on your life, old son! This Winchester and I stick closer together than the Siamese twins."

Nelson thrust his foot into a heavy stirrup, eased his weight into the high peaked saddle and gripped the pommel, for though an excellent horseman, he had no clue as to what motion would ensue. It was wise he did so, for the podoko reared suddenly, almost flinging his rider from the saddle.

Immediately Hero John mounted, raised his right hand and dealt his podoko a stinging slap on the fore-shoulder. The great reptile hissed in protest, but commenced to walk off with an awkward, hopping step. Nelson's mount followed suit.

Faster and faster ran the podokos, their long and scale-covered necks stretched far out ahead while

their tails lifted correspondingly, much like that of an airplane about to take off.

"Whew! He must be doing all of forty-five," gasped Nelson, while the wind whistled about his ears and snapped madly at the yellow crest of his brazen helmet.

The ride which ensued remained forever fixed in the aviator's memory. Like so many shots from a gun the three podokos darted off out of the stables, past a gate guarded by a battery of retortii, whose red plumed cannoneers sprang to attention as the three strangely assorted riders sped out into the amber, perpetual light of Atlans.

Nelson, on finding his balance, looked about him to receive impressions of immensely tall structures, of pyramids which, like the ziggurats of Sumaria, and Babylon, were surmounted with beautifully proportioned temples.

"Must be at least a million people in this burg of Heliopolis," thought Nelson, easing his Winchester.

Hour after hour they sped along, frequently overtaking detachments of troops. Twice they halted to change mounts, though the podokos seemed quite tireless.

At the end of five hours' furious riding, Nelson beheld a dense white cloud low on the horizon.

"What's that?" he demanded. "Fog?"

"No," Hero John informed him. "Yonder flows the Apidanus, the boiling river. Not far away to the left lies the frontier fortress of Cierum, where is encamped the Emperor, who will sit in judgment upon thee."

Nelson's heart sank. He had been so occupied with his fears for Alden that he had not dwelt upon his own precarious position.

Scarcely half an hour elapsed, if Nelson's wrist watch were running correctly, before he reached the tremendous, swarming camp of Altorius XXII, Emperor of Atlans. Hero Giles proved to be a

powerful talisman, for everywhere officers and men alike saluted respectfully and sank on one knee as he passed.

"Wait here," he snapped, as the podokos sank obediently to the dust. "Brother John, do thou guard Friend Nelson while I seek permission of His Serene Splendor to bring the Wanderer into the Presence."

Almost immediately the elder Atlantean returned, a frown on his scarred, rather brutal visage. "Come," he muttered, "but I fear for thee, Friend Nelson; His Splendor is in a savage mood—this raid hath stirred his ire beyond all bounds."

"Nothing like cheering up a patient before he goes into the operating room," thought Nelson, and quietly threw off the safety on his Winchester. "Six shots," he reflected. "Well, if I go, I reckon I'll take some damn good company along."

The aviator was led down a long passage, at every ten feet of which was posted an enormous scowling guard, whose spears, retortii and armor were painted

a brilliant jade-green. Then a musical, deep-toned gong boomed twice, and Hero Giles halted before an exquisitely wrought door, which, without any apparent propulsion, silently slid back into the massive stone walls, revealing a huge, brilliantly lit circular chamber that was hung with emerald-green hangings. In the center, surrounded by a royal guard of nobles in splendidly jeweled armor, was reared a dais, upon which stood a throne that blazed with the most varied collection of diamonds that Nelson could ever have imagined.

"Down on your face," rasped Hero Giles as, in common with his brother, he knelt and then fell prostrate on the cool black marble floor.

"Damned if I will," murmured Nelson, and remained erect.

Bolt upright, he looked across the interval and found himself staring into the furious eyes of one of the handsomest men he had ever beheld. Gripping his Winchester in a kind of "port arms" position, he stood to attention—by some curious kink of the brain

reverting to his military days. And so the two men, different as day and night, faced each other. Altorius XXII clad in robes of scarlet, and a glittering cuirasse that glowed like the evening sun. His yellow head was truly splendid, reminiscent of that of a young Roman Emperor. The hair, like that of the Hudsonian Heroes, was blond, curly and close cropped. Yes, thought the awed but self-contained American, there was something genuinely imperial about the Emperor's aquiline visage, for a high intelligent forehead and piercing blue eyes dominated a strong mouth, which was marred by a decidedly cruel twist at the corners. On him, also, was set the stamp of Sir Henry Hudson's dauntless race.

"Put him in a business suit and a soft gray hat," mused Nelson, "and you would find a dozen like him in any of London's best clubs."

"Down on thy face, sirrah!" Outraged, the Emperor's voice rang like the peal of a brazen trumpet through the great pillared audience chamber. The nearest guardsmen held themselves ready, hand on sword hilt.

"No." Nelson's shaggy black head went back as he found his tongue at last. "No, Your Majesty. In America we have our own way of showing respect for authority. I'm an American and, with all respect, I'll salute you as one."

So saying, his hand flicked up in a sharp military salute to the visor of that Atlantean helmet which he still wore.

"All damn foolishness," he silently told himself. "I feel like the lead in a ten, twenty, thirty melodrama. But I suppose it's got to be done."

The Emperor's teeth gleamed in a half snarl as he sprang with Jovian wrath to his feet.

"Dog! How darest thou bandy words with us?"

"Have mercy!" hoarsely pleaded Hero John as he lay on the floor. "Have mercy, oh Splendor! He is but an ignorant wanderer from the Ice World."

It appeared that the young Hero was something of a

favorite, for the masterful, thunder-browed Emperor checked himself and, still glowering, settled back on the diamond throne.

"Ye have my permission to enter and approach."

Whereupon, Hero Giles arose and, with many black looks at his guest, strode forward to briefly explain his presence.

Nelson felt Altorius' blazing blue eyes search his face.

"Then he whom the dog-born Jereboam captured was thy friend?"

"Yes," replied Nelson with dignity, "my best friend. Alden and I have traveled and wandered all over the world together."

"Over the world? The Ice World?" Altorius seemed interested, for he leaned forward, muscle corded arms very brown against the frosty brilliance of the stones studding his throne. He flipped back a scarlet cloak and bent a searching look on the straight,

unafraid figure below.

Impatient to reach a decision, Nelson forebore to amplify the Emperor's assumption that the outside world was all ice and snow.

"Yes," he said, "from the land of America. I've spoken with Hero Giles, Your Majesty's Captain-General."

"So, then, no doubt, he has told you of the law of our country?" Altorius' white teeth shown again in the depths of his short, curling beard.

"Perhaps." Nelson was vague, wishing no further amplification.

"The law of Atlans," pronounced the Emperor with a frown, "states that a stranger must prove his worth to the State, else he must be put to death. Thank thou thy gods that thou hast not fallen into the hands of the Lost Tribes, for assuredly thou would perish miserably, as must thy comrade."

"What is the law of Jarmuth?" inquired Nelson, his

mind furiously at work.

"Their law states that the stranger within their gates must perish on the altar of Beelzebub, Jarmuth's blood-hungry demon god." A momentary expression of sadness crept into the Emperor's blue eyes and he beat a square, powerful hand on the arm of his throne. "Aye, blood-hungry! Lack-a-day! But yesterday, six of our fairest maidens crossed the boiling river, never to return."

Nelson was about to speak when from outside came the blast of a trumpet. The assembled Atlanteans started, paused, and remained silent, listening intently.

Hero Giles looked up, a light kindling in his deep-set eyes. "Yon was an Israelite trumpet."

As the words left his lips there came a hurried rapping at the portal, whereupon the guards sprang forward.

"Bid them enter." Altorius seemed strangely tense and

uneasy.

Quietly the door rolled back as before, revealing an Atlantean whose eyes rolled with alarm. He hurried forward and flung himself on the floor at the Emperor's sandaled feet.

"Harken, oh Serene Splendor! Waiting without is an embassy from his Majesty of Jarmuth. They bear words for thine Imperial Highness."

"Now, by Saturn! Here's insolence—at an hour such as this!" With a furious swirl of his scarlet cloak Altorius leaped to his feet, hand on the ivory handle of his sword, which, to Nelson's amusement was not of bronze, but of good, blue-gray steel.

"I'll bet it's old Sir Henry's original pet sticker," he thought.

"Bring on these dogs of Israel," growled Altorius.
"They shall die!"

"Gently, gently, oh Splendor," murmured Hero John.

"Our full force is not yet camped on the Plains of Poseidon."

"Nay! Have the rogues flayed alive!" was the advice of the hot-headed elder brother. He, like the Emperor, was scowling and livid with fury.

Presently there appeared four men, stalwart warriors as totally different in aspect from the Atlanteans as humans might be. The two races were alike only in splendid physical proportions and human figures. They, the Jarmuthians, were black haired and dark skinned, whereas the Atlanteans, with the exception of Sir Henry's progeny, were red headed. Truculently the half naked ambassadors strode over the polished floor, which reflected their rude images. Their hairy chests, arms and legs afforded a sharp contrast to the neat Atlantean nobles, who drew back with expressions of disgust.

"Good God!" gasped Nelson in lively surprise. "A bunch of the boys from Seventh Avenue!"

It was true: each Jarmuthian clearly betrayed his

Hebraic origin in huge, fleshy nose and pendulous lower lip, so characteristic of the Semitic race. They were fierce, shaggy fellows, naked from the waist up save for a kind of jointed body armor, reminiscent of a Roman legionnaire's. Their long abundant blue-black hair was either plaited or flowed uncut over splendidly muscled shoulders. Their beards on the other hand were short and frizzed into tight curls, in the Assyrian manner. On each man's head was set a highly polished, pointed casque of copper, surmounted in each instance by the six-pointed star of Solomon. Otherwise the brutal looking emissaries wore nothing but dirty, food-spotted kilts and rough hide sandals secured by thongs.

With all the insolence and self assurance of conquerors in the presence of slaves the four jet-eyed ambassadors swaggered up to the diamond throne. Then the foremost briefly inclined his head towards Altorius in a grudging salute and began to speak in deep, resonant tones.

From that point Nelson could understand nothing of the conversation as it was carried on in the guttural

and unintelligible language of that lost realm, but, from time to time Hero John found opportunity to translate an occasional phrase.

Darker and darker grew the brows of the gorgeously attired Emperor and his eagle-visaged Captain-General as they listened to the pompous oratory of the foremost Jarmuthian, and in dark fury more than one Atlantean noble half drew his sword when the speaker fell silent at last.

"He said," the younger Atlantean whispered, "that Jereboam is no longer satisfied with six maidens. Beelzebub demands a further offering of six more damsels to be delivered before the third division of time on the morrow. By Saturn! The insolence of these besotted swine passes all tolerance!"

From the Atlantean Emperor's outraged negative gestures, Nelson surmised that Altorius was making an emphatic refusal and even adding some vicious threat. The foremost Jarmuthian slapped huge dirty hands on armored hips and fell to laughing with an insolence that would have provoked a rabbit.

Forgetting dignity and self-control, Altorius, in a single tigerish leap sprang from his throne and knocked the mocker senseless with a powerful blow to the jaw. Then, spurning the fallen Jarmuthian with a sandaled foot, the Atlantean fixed blazing eyes upon the three other ambassadors who, nothing daunted, closed up, muttering savagely in their frizzed black beards, while their hands sought the spot where swords would normally have hung.

"Nice right to the jaw," commented Nelson with a grin. "He's still English enough to use his fists." He turned to Hero John, who stood with an expression of horror on his comely features. "What caused the row?"

"Verily, our plight is grave indeed. That braggart dog threatened to march on Heliopolis in the first division of morning, and,"—Hero John's lips compressed into a hopeless, taut expression—"our reinforcing phalanxes can never arrive in time to defend Cierum at that hour. Should the defense fail, as it must—since they outnumber us three to one for the nonce—it would cost us many thousands of men to stay the blood-

hungry hordes of Jereboam once freed on the great plain."

Like a star shell bursting on a cloudy night came the inception of an idea.

"Here," cried Nelson, "I've an idea! Maybe I can fix a stall until the rest of your boys do a General Phil Sheridan and get here."

Hero John's blue eyes widened uncomprehendingly. "What?" he demanded. "What dost thou propose?"

Nelson's hand crept to his head, for the unaccustomed weight and heat of the helmet made it itch. "You say these bright boys from over the border want to chow six more girls? Am I right?"

"Yea, oh Friend Nelson, they demand the victims tomorrow morn, else they advance."

"All right." Nelson was thinking fast now, a dreadful vision of Richard Alden stretched for sacrifice on the brass altar of Beelzebub ever floating before his

aching eyes. "Tell those Semites that they can have those six girls *if* they can take them away from me."

A puzzled frown creased the younger Hero's brow and he tugged thoughtfully at his scant yellow beard.

"Prithee pardon me, but I do not comprehend."

"All right, get this now! Tell the Jarmuthians that they can send six of their biggest and best scrappers, one for each girl. If they can take any one of those girls away from me, they take them all—taking me as well—and we'll all get the works in Jezreel together. But, on the other hand, if I kill their six champions, then Alden is returned unharmed, the six girls come home and the six other girls come back too—and there'll be no more hostages. I don't think they'll agree to or even consider surrendering Your Princess, Altara. I'm sorry I can't accomplish that, too. But if I can stop this annual tribute, it won't be so bad, will it?"

Rounder and rounder grew the Atlantean's eyes, and he gaped like a school boy in a side show.

"What sayest thou? Thou alone to overcome six of

their best warriors? Nay, but this is folly! Moonshine! What knowest thou of their weapons?"

"Nothing," admitted Nelson, "but I do know Brother Winchester here." He patted the smooth stock. "He's mighty persuasive, properly handled."

"But they are armored! They have the fungus bombs, the light retortii and the javelin!"

"Righto!" agreed Nelson a trifle carelessly, "but you don't know what this old boy can do when he's put to it. Well?"

"By Saturn!" An uncertain ring crept into the Atlantean Prince's voice. "A moment, while I address His Splendor."

"I'm a fool, a damn fool!" thought Nelson. "Still, it's Alden's only chance—unless the Jarmuthians've got some trick I'm not on to, I ought to stand a fighting chance." Meanwhile Emperor and Captain-General drew to one side, listening to Hero John's impassioned oratory. That the idea met with disapproval, Nelson

quietly recognized from the incredulous, even contemptuous, glances Altorius shot at him. Leaving the four sneering Jarmuthians under guard of the nobles, the Emperor came striding impatiently over the inlaid floor.

"What madness is this?" he demanded harshly. "Dost thou realize what would hang upon thy skill? If thou shouldst fail, our annual hostage for the divine Altara would be twelve instead of six of our maidens. Further, the dog-conceived Jereboam would wax unbearably overweening and insolent. Nay, there is too much at hazard! Though outnumbered we will give battle in the morning."

"Yes?" demanded Nelson, in turn impatient. "A fine chance you'd stand! Why, less than half of your army is here at Cerium and Hero John tells me that the enemy have massed their entire forces on the salient of Poseidon. Isn't that so?"

Altorius' handsome brow darkened. "Aye," he admitted, "but our reinforcing corps will come up before the third hour of the third division."

Here Hero Giles broke in and, speaking with the quick, impassioned tones of one whose reactions are violent, pled for confidence in the American. "Nay, fair cousin," he replied, casting a sidewise look at the Jarmuthians standing in muttered colloquy with their leader, who had now gotten to his feet and was angrily dabbing the blood from his chin with the hem of his yellow kiltlike garment. "I saw with mine own eyes what miracles Friend Nelson doth perform with his curious noise-making retortii. If Jereboam falls upon us ere our regiments are marshaled, then, verily, are we doomed. We have no choice but to play for time. Harken to the counsel of Hero John! Methinks this stranger from the Ice World is no braggart. He will fight well. If he loses he dies horribly—that he knows. The thought will strengthen his arms, and if he wins—!"

Then broke in Nelson firmly. "If I win I must have the word of Your Majesty that Alden and I are to be afforded all help and free passage to that place where your soldiers captured my friend. It that understood?"

Altorius' blue eyes shifted and there was a slight

hesitation in his manner. Then, coming to a decision, he whirled and extended his hand.

"Good, 'tis agreed," he said. "On my head be it. Have patience while Hero Giles confers with these outlandish dogs."

It was with intense interest that the anxious aviator watched the ensuing conference. He could see the four Jarmuthians listening, dark eyes restlessly flitting back and forth, and their mouths twisted into contemptuous half snarls. Then, as Nelson's offer was made clear, a look of cunning seemed to creep into the eyes of the leader. He asked for clarification of several points, then, being informed of the details, his thick lips parted in an evil, crafty grin.

Taken aback at the suspiciously ready acquiescence of the enemy, Hero Giles turned about. "They agree," he translated, "that, should Friend Nelson win, they will return to their own land, they will forfeit the annual tribute forever and return the other stranger unharmed. They speak fair, but I fear—" He bit his lips in perplexity. "These dogs, who talk with the

forked tongues of serpents, plan some snare, some cunning trickery."

"Repeat the terms." Altorius seemed gripped with apprehension too. "Let all be clearly understood: at the third division of morning will the wanderer fight six warriors. No more and no less."

This was agreed and reaffirmed. Then, with an insolent, triumphant laugh, the Jarmuthian delegation whirled about and stalked from the room, their dark greaved legs flashing in military unison over the polished floor.

"'Tis done," quoth Hero Giles gloomily. "The encounter will take place on the plain of Gilboa at the third hour of the third division. And may Saturn help us if thy might fails. Friend Nelson! For then surely will the hordes of Jarmuth despoil us and there will come a desolation and a darkness upon the Empire of Atlans."

Chapter 5

It seemed incredibly soon that Victor Nelson found himself striding out from the serrated ranks of the Atlantean army which, drawn up in a rough diamond formation, looked discouragingly small in comparison to that vast sea of helmets twinkling ominously across the plain of Poseidon amid a haze of bright yellow dust which climbed lazily into the breathless heavens. The Jarmuthian army, numbering perhaps sixty or seventy thousand effective troops, lay encamped in a great salient formed by a convolution of the Apidanus and formed the only Jarmuthian tract of the great valley lying south of the boiling river.

Like low-lying snow drifts, the sheen of the enemy tents struck Nelson's eye as he strode over the bright green turf to battle for Richard Alden's life.

"There was something back of those nasty grins of the ambassadors," he reflected. "I wonder what deviltry they're cooking up?"

He glanced at a stalwart Atlantean herald who,

nervous in the extreme, clutched his brazen, dolphin-shaped horn and followed in the American's wake together with a sad little company. Weeping, moaning and dressed in plain black robes marched six really lovely girls—they who would perish on Beelzebub's altar if Nelson failed. Bitter were the looks of the guards as they secured the hands of the victims and many the hopeful look cast at the impassive American when they turned back, leaving the helpless girls to their fate.

The ground where the one-sided duel was to take place was marked off by means of little yellow flags on a level plain perhaps a quarter of a mile long and wide. Arriving on the nearest border Nelson briefly motioned the herald to halt.

"Might as well start shooting at the best range possible, and beat their steam throwers," he decided. "Wish to the devil I'd a few more cartridges. Only thirteen shots between me and Beelzebub's altar in Jezreel, so I'd better not miss. All right, son, toot your horn."

With his thumb he gestured the command, whereupon the Atlantean nodded eagerly and, filling his chest, set horn to lips to blow a long, strident note that rang harshly, boldly out over the great plain.

While the note of the challenge rang out, Nelson's eyes turned back to regard the Atlantean array and detected, far in the rear, a huge pillar of dust which must mark the progress of the Atlantean reinforcements. Would they arrive at Cierum in time? Then his eyes sought that spot where Altorius and his staff sat anxiously on their podokos, watching intently the impending struggle. Very clearly the flash of their armor came to him.

"I guess, like the girls back there, they're kind of nervous and jumpy," thought Nelson. "Well, I don't blame them. I've had quieter moments myself."

Having blown three blasts, the Atlantean herald saluted; then, with disconcerting haste, made his way back to the ranks of his fellows some two hundred yards away.

From the Jarmuthian army came an answering blast. Nelson cast a last look on the Atlantean army, breathlessly awaiting the impending duel. There was the allosauri corps on the far left; he could see the chimeric monsters' long, repulsive necks writhing endlessly back and forth through the air as they squealed and tugged strongly at their restraining chains. On the right were stationed perhaps ten thousand podokesons, their slender, yellow-shafted lances swaying like a sapling forest in the distance. In the center were eleven thousand protection infantry, green-crested and armed with compact tanks of blue-maxima vapor, fungus bombs and swords. Behind them, and corresponding to heavy infantry, were ranged some twenty thousand blue-plumed hoplites, eagerly fingering the brazen hoses of their death dealing portable retortii.

Nelson had no time to further study the array, for he whirled about as from the Atlantean army arose a deep, horrified shout. He stood paralyzed, his jaw slack. For there, waddling slowly forward, came the most fantastic huge creature imaginable.

Unspeakably repellent and horrible, it stood on short

legs thick as mature trees, to tower at least thirty-five feet above the ground at the fore-shoulders! An immense reptilian neck some twenty-five feet long weaved continuously back and forth, while a surprisingly small, bullet-shaped head emitted rumbling grunts.

"Great God!" gasped the horrified aviator, and felt the ground sway under him. "It must be ninety feet long!"

Paralyzed by a dreadful fascination he watched the ungainly, hill-like reptile shuffle ponderously forward and realized that, high on its back, was fixed a small fort, rather like those howdahs or boxes which are fastened to the backs of elephants. Chilled with the nearness of death, Nelson counted six mail-clad warriors in the howdah. Then the true import of the Jarmuthians evil jest struck him with full force.

"Six men, they said. And six men there are—but the treacherous devils mounted them on that walking hill-side! Guess Altorius can kiss his six girls good-by right now. Poor Alden! Well, I did my best—a rotten trick."

At that moment he felt as an ant must feel on beholding the approach of a human. It was terrifying, the inexorable advance of that colossal, fantastic monster. From behind he could hear the infuriated shouts of the Atlantean army. They knew even he could not hope to withstand the murderous onslaught of the beast now entering the duelling space.

On came the diplodocus, its vast warty tail trailing over the ground and raising a heavy column of dust, while its mud smeared sides bore out Hero Giles' statement that here was one of those semi-aquatic titans from the steaming swamps of Jarmuth.

"Hell! Poor Alden's as good as finished now! What a fool I was to think I could save him!"

Obedient to an overwhelming fear, Nelson whirled to flee, then stopped, as, from the depths of his being, a stronger power forbade him to desert his friend to certain death.

"Range two hundred and fifty yards," he estimated, and, whipping up the Winchester, sighted full at the

ponderous creature's slimy snakelike head. When the recoil jarred his shoulder, Nelson dropped the barrel an inch or so to watch. Nothing happened. The great beast was advancing as before, its incredibly long neck weaving steadily back and forth as though to sniff the air.

"Hell!"

Struck by a sudden thought, he snatched a cartridge from his pocket and, with that strength which comes to men in their hour of mortal peril, wrenched out the metal-jacketed bullet, to reinsert it backwards into the brass cartridge case.

Meanwhile the vast brute had drawn nearer, crushing flat a young oak in its path as easily as though it had been a wheat stalk.

"Maybe this dum-dum will do some good," panted Nelson. "If it doesn't, nothing will stop it!"

Again he sighted until, finding those small, orange red eyes in line with his sight, he fired. This time the

gray-brown monster uttered a titantic bellow of rage, halted, and began shaking its clumsy blunt head.

"Hit it, by God!" exulted Nelson, and seized the momentary respite to slip two fresh cartridges into the Winchester's magazine.

But, to his inexpressible dismay, the monster presently resumed its ponderous progress while the Jarmuthians in the howdah uttered taunting yells that reached him faintly, while the sun flares glinted on their brandished swords and lances. One of them plucked a fungus grenade from his belt and flung it with all his might in Nelson's direction. The missile fell to the earth far short of its destination and seemed to break rather than explode, at the same time expelling that deadly, greenish-yellow vapor which, blown away by a strong wind, fortunately came nowhere near the doomed aviator.

"Oh! You will?"

Nelson sighted swiftly at the grenade-thrower and fired, whereupon the Jarmuthian, some hundred and

fifty yards distant, spun crazily about, flung both arms towards the amber-yellow sky and toppled from the howdah, for all the world like a diver in quest of pearls.

From both breathless armies rose a terrific shout. Accustomed as they were to the visible destruction of the retortii, this noisy yet invisible death was appalling.

But Nelson's agonized attention was not on the assembled armies, for nearer came the mountainous diplodocus, its lumbering strides making the howdah sway like a ship in a gale and preventing use of the portable retortii.

Nelson planted both feet, took fresh grip on his waning courage and shot again, this time aiming at a gigantic, black bearded warrior who seemed to be training one of those portable retortii upon him.

Again the Winchester cracked and this time the black bearded man sank from sight back into the howdah, while his companions, uttering vengeful shouts,

tossed more fungus bombs at the lone heroic figure barring their progress towards the six bound and shrieking maidens.

Towering thrice as high as the largest African elephant, the diplodocus was now but seventy-five yards away. He had hit it, that Nelson could tell, for a large shower of blood sprayed from the monster's neck. Then, uttering a despairing curse, he sent a shot smacking squarely into the left shoulder, at the base of that mastlike neck with fervent hope of finding the heart. But the heavy bullet bothered the cyclopean reptile no more than a sting of a mosquito.

On, on it came. In another minute it must stamp out Victor Nelson's life beneath feet as large as hogsheads.

"Damn!"

Nelson snapped the ejector lever, throwing out the spent cartridge.

"No use," he whispered, "can't faze that hill of meat!"

But I might as well kill all of those bloody cannibals I can."

With amazing speed and accuracy he picked off two of the remaining Jarmuthians, whose shining, bronze armor could nowise withstand the wicked impact of modern nickel-jacketed bullets. One of the stricken men for a moment dangled with the last of his strength from one of the chains securing the howdah to the enormous creature's back, then tumbled heavily some forty feet to the earth.

Only two shots more in the magazine—! Nelson suddenly found himself very cool. "Two shots and then —"

He was conscious of that great, snakelike head darting viciously in his direction. A huge, slobbering mouth, studded with teeth a foot long, yawned redly before him like a nightmare incarnate, blotting out consciousness of all else. Then Victor Nelson, fighting to control his strumming nerves, deliberately sighted into a great, orange colored eye, saw the narrow black iris over the Winchester's front sight and knew

the huge warty head was not ten feet away.

He pressed the trigger and never heard the report, but felt the blast of a furnace-hot breath in his face—a breath that stank like the foul reek of burning rubber.

With a detached sense of surprise he saw the eye miraculously and dreadfully disintegrate; then, as the bitter smell of burned cordite stung his nostrils, he sprang violently sidewise to find himself staring up at the howdah, now towering at least forty feet above.

The next few moments were indescribable. Horrible roars and bellows, loud as those of a thousand angered bulls, shattered the air. The diplodocus halted, stunned by pain and the partial loss of eyesight; then, its infinitesimal brain becoming gripped with fear, it plunged and lumbered sidewise, nearly shaking the warriors from the howdah, where they clung for dear life. Nelson was barely able to avoid the sweep of the powerful tail as the diplodocus wheeled about on hind legs, reeled and started blindly back towards the Jarmuthian ranks. Suddenly it stood stock still, shaking with super-elephantine

motions. Then, for all the world like a balky mule, it sank to the earth and cowered there, despite the frantic efforts of the surviving Jarmuthians to stir it to obedience.

By the strong amber light of the sun flare Nelson had a vision of the last two warriors swinging in apelike agility to the ground. They were giants, those two men of Jarmuth, and their conical helmets added additional stature. One of them, shouting an unintelligible taunt, reached for his belt to snatch out a fungus bomb, but Nelson, dropping on one knee, sent a bullet crashing between the Jarmuthian's scowling eyes. Even as he fell, the last of the six champions unwisely ignored his retortii and frantically sprang forward, razor-edged sword upraised.

Nelson frantically worked the ejector lever but only an empty click resulted! His heart sank. "Hell! the magazine's empty!"

He had just time to swing the Winchester about and grasp its barrel as the Jarmuthian, with a loud shout,

sprang in, slashing viciously at Nelson's unprotected neck. Using the clubbed rifle like a baseball bat, the American struck out with the strength of despair. There came a resonant clang as blade and barrel encountered each other. Steel is ever stronger than bronze, so Nelson had the satisfaction of seeing the Jarmuthian's sword blade break squarely in two near the hilt.

Horried, the black bearded warrior glanced at the empty hilt in his hand but, courageous to the end, sprang in like a tiger to grapple with that small, agile man in khaki and serge.

"You would—eh?" gasped Nelson.

Putting all his strength behind a blow he whirled up the heavy Winchester, struck out and felt the solid walnut stock smash fair and square on the conical helmet. Like an eggshell the bronze helm broke and the six-pointed star above went spinning off into the dust. As a tree sways before it falls beneath a forester's ax, so the dark Jarmuthian giant tottered, while the wide dusty plain of Poseidon echoed with a

rumbling, incredulous shout.

"There," choked Nelson, incredulous to be still alive, "I guess that'll be about all for to-day."

But he was wrong. From the ranks of Jarmuth rose a terrible, ominous cry and at the same time there broke out the sibilant hiss of a thousand retortii. From the Atlantean army came an answering yell and Nelson turned to race back to the shelter of Altorius' body-guard, pausing but to arouse the terrified hostages. Swiftly he cast loose their bonds and pointed to the nearest detachment of Atlanteans. Sobbing with joy the six girls fled for dear life just as the first of the allosauri went racing over the plains. Screaming, all-powerful and uncanny war dogs, they bounded grotesquely high in the air, plunging straight towards the Jarmuthian ranks which greeted them with a searing, billowing blast of their retortii. Though dozens of the terrible creatures fell kicking and writhing beneath the scalding discharge of the retortii, the main body, perhaps forty or fifty in number, sprang like rending fiends into the dense packed masses of Jarmuthian infantry.

Of the ensuing battle, Nelson had but the most confused recollections. The dominating impression was that the fray was awesome, horrible beyond power of description. He recalled feeding the five remaining cartridges into the magazine, then clapping on an Atlantean noble's helmet. With Hero John at his side he joined in an furious headlong charge of the podoko corps.

Like a vast glittering wedge the gallant Atlantean lancers advanced under shelter of the blue maxima vapor which, discharged by the protectons or light infantry, dispelled the scalding steam clouds launched from the Jarmuthian portable retortii.

"Halor vàn!" Hero John shouted the Atlantean war cry. "Halor vàn! Come Friend Nelson, this day shall the treacherous swine of Jarmuth drown in their own blood! Halor vàn!"

Nelson replied nothing. He was too busy drawing a bead on a gorgeously arrayed enemy officer who appeared to be directing the defence.

Faster and faster rushed the podokos, forty, fifty miles an hour, a carnate thunderbolt hurled straight at the enemy center. Under a hot fire of grenades dozens of the lancers fell and once, when a fungus bomb broke near by, Nelson saw half a dozen Atlanteans tumble from their saddles, the hideous yellow growths already sprouting from nostrils, mouth and ears. The turmoil became deafening, indescribable—like the roar of a crowded subway.

The American had a brief glimpse of a mountainous diplodocus assailed by half a dozen hissing, shrieking allosauri who, employing jaws and claws, ripped great, shuddering chunks of flesh from the agonized and unwieldy monster on whose back the frantic Jarmuthians fought with terrible ferocity.

As agile as grasshoppers, those fierce war dogs ripped and worried their prey. One of them clung like a bulldog to the doomed diplodocus' head, though the twenty-foot neck writhed and whirled frantically in effort to shake it loose. Another allosaurus, whining with eagerness, actually clambered up the back of an assailed giant only to fall back under the blast of a

retortii mounted in the howdah. Bathed in live steam, with bones showing through its melting, quivering flesh, the allosaurus collapsed backwards, but another instantly took its place and, gaining its goal with a terrific leap, made a shambles of the howdah, tearing the men in it apart as a lion does an antelope.

Nelson found himself very busy. The charging podokesos were now in the midst of the Jarmuthian heavy infantry, slashing down at a maze of yelling, black-bearded, Semitic faces. Once Nelson was nearly speared, shooting his assailant just as the lance glimmered over his heart. Again he saw the Atlantean hoplites beaten back amid a pestilential fog of fungus gas which stretched them in kicking, loathsome heaps on the dusty plain. The uproar became terrific, indescribable, as the whistling screams of the allosauri and the saurean bellows of the diplodoci rose above the shouts of the soldiery to fill the dust-laden air with a dreadful clamor. The battle now swayed critically; a feather's weight on either side and one army would roll back in red, irretrievable ruin. It was the psychological instant. Nelson sensed it unerringly.

"Look!" shouted Hero John, dashing a rivulet of blood from his eyes, "there fights the dog-begotten Jereboam himself! Halor v`an! Smite, ye soldiers of Atlans! Smite!"

Following the line of the outstretched hand. Nelson caught a glimpse of an enormous, eagle nosed warrior who, clad in gleaming, diamond studded harness, fought like a paladin of old. Powerful as a dark Ares the sable browed Jereboam raged among the dismayed Atlantean hoplites, beating them to earth with terrible ferocity.

It was a long shot, one he might readily have been forgiven in missing but with the speed of thought Victor Nelson sprang from his podoko, dropped on one knee behind a pile of corpses and, uttering a fervent prayer, fired full at Jereboam's black head.

The nearest combatants drew back momentarily at the unfamiliar thunder of the report and fell silent while the groans and shrieks of the wounded rose loud. As a man looking through many thickness of glass, so Nelson saw Jereboam reel on his splendidly

caparisoned podoko, clasp both hands to his forehead and sink to earth.

Hero Giles, somewhere far in the Atlantean van, saw what transpired and capitalized it with the inspiration of a genius.

"Jereboam is dead!" he shouted in ringing tones, and flashed his red stained sword. "Woe to Jarmuth this day! Smite, ye sons of Atlans. Woe to Jarmuth—Jereboam is fallen!"

And smite hard the reinforced Atlanteans did. Filled with a new courage they advanced so determinedly that the disconcerted and dismayed Jarmuthians broke and fled in a disastrous, panic-stricken rout back over the plain of Poseidon towards the boiling river.

The ground was already carpeted with dead and with abandoned equipment, when fresh packs of allosauri were loosed on the fleeing Jarmuthians to wreak havoc indescribable and, ere long, only the triumphant, panting Atlanteans remained on the field.

Chapter 6

There was music and high revelry in the fortress of Cierum that night, and Victor Nelson, embarrassed and flushed with the extravagant adoration of all Atlans, sat by the Emperor Altorius' side waiting, watching for the appearance of a humbled Jarmuthian delegation.

"Never since the world began has there been such a hero in Atlans!" cried Altorius, his face more Roman than ever. "Prithee tarry amongst us, Hero Nelson. Thou shalt be as my brother. A marble palace shalt thou have and twenty wives, each fair as those damsels which thou hast, by thy might, rescued from the profane altar of the fiend, Beelzebub!"

"Thanks," laughed Nelson, and drained a goblet of tawny wine. "I'd be delighted to stay, but the point is —He broke off short, for there came a sudden tramp of feet at the door of the great hall and there, just visible above the green crests of the royal guards, he recognized that pale, drawn face which had haunted him ever since he had returned to find the abandoned

aeroplane.

"Dick!" he shouted. "Dick Alden!"

"Nelson!"

With that same irresistible form which had won a certain November classic for Harvard, Richard Alden bucked and plunged through a double rank of startled guards and came running across the marble floor, his eyes lit with an unspeakable gladness.

"Nelson! Nelson!" he panted. "What in hell are you doing up there?"

"Oh!" replied the aviator with a joyous grin, "just visiting with my friend, the Emperor."

Alden halted, on his handsome features a curious mixture of surprise and delight. "The Emperor?" he stammered. "You sitting beside an Emperor?"

"Would it not seem so?" inquired Altorius with a low laugh.

"It would," chuckled Alden. "Victor Nelson, as I remember, always was a good politician."

"And," thought Nelson, "I'll have to be a damn sight better one to get us out of Atlans without injuring Altorius' feelings. I don't suppose he'll ever be able to realize that all the desirable things in the world don't lie in this valley."

Throngs of brilliantly armored and plumed officers and courtiers, some of them nursing wounds and bandaged heads, came up to hail the mighty wanderer who had subdued the might of Jarmuth.

Flushed and pleased, as is any normal man under well-earned praise, Nelson shook one wiry fist after another, while Alden chatted with the Emperor. Nobles, officers and courtiers all pressed close to fawn upon the new hero—but, far back in the council chamber, a group of dark robed priests were crowded together. Haranguing the priests was a fierce, white bearded old man who seemed to be arguing violently.

"Hum!" thought the American. "That's at least one

outfit that doesn't like the way I part my hair. Wonder what devilment the priests are cooking up?"

He was not long in finding out, for the black robed arch-priest suddenly left his group of underlings to boldly make his way forward, while princes, courtiers and warriors drew respectfully aside and bent their heads.

"Hail! All conquering Emperor!" The stern old man halted squarely before Altorius' gem encrusted throne, while Alden checked some remark to look curiously down upon the hawk-featured arch-priest.

Altorius flushed and the lines about his mouth tightened, from which Nelson guessed that there was more than a little bad blood between the spiritual and temporal heads of the empire.

"What wouldst thou, oh Heracles?"

"I would know why the all powerful Wanderer, of whom thou makest so much, did not rescue Princess Altara?"

The Emperor stiffened. "Her rescue, being impossible of accomplishment, was not nominated in the agreement," he said coldly. "The Wanderer has in full carried out his share—and so shall we. Honored and beloved of Atlans, these great warriors shall abide among us in peace."

Here Nelson thought it wise to dispel any illusions Altorius might entertain about their staying in Atlans. "No, oh Splendor: remember, our agreement was that, should I conquer the Jarmuthian champions, Alden and I were to be allowed to go free."

"Nay, oh Splendor," fiercely broke in the arch-priest, "permit them not to go. I tell thee the Princess Altara *must* be restored to Atlans! Else,"—a distinct note of threat crept into the old man's voice—"—else evil days shall fall upon this empire, and the line of Hudson will wither and fade."

Up sprang Altorius in a towering rage. "Sirrah! Dost dare make threats to thy liege lord?"

Fire flashed from the young Emperor's bright blue

eyes, and under their fierce glare the old man quailed and stepped back with eyes lowered.

"Altorius keeps his word," the Emperor thundered. "The strangers shall go, though all the black-robed kites in the realm say me nay. The word of a Hudsonian prince is as sure as the fire of Pelion. Get thee gone, rash priest!"

A long moment, the two strangely contrasting figures glared at each other, the young, splendid Emperor and the malevolent, withered old man.

"The Gods demand their daughter," cried Heracles in parting, "and woe to him who says them nay!"

With this parting shot, the arch-priest turned and, scarlet faced, stalked from the council room, while Altorius threw back his head and roared with laughter.

"Come, oh ye Heroes, ye princes and captains! Come, let us make festival before these mighty wanderers go their way!"

Roar upon roar of enthusiasm echoed through the marble throne room, and Nelson would have felt wholly at ease had not that little knot of priests remained gathered like ill-omened carrion crows about the door. Muttering among themselves, they were watching him with a curious intentness that aroused deep misgivings in the American's mind, and it was with something like a sigh that he joined the procession forming to proceed to the triumphal feast on which the wealth and luxury of the whole empire of Atlans had been lavished.

Chapter 7

"That's one of the fixed retortiiis I was speaking about," remarked Victor Nelson as he paused to point out a tapering brass tube which was mounted on a platform above the long staircase up which he and Alden were toiling. "It's a big brute: see how small the gunners look beside it? These steam guns are wonderful things."

The younger aviator sighed. "I've had enough of miracles," he said wiping his flushed features and hitching a small pack higher on his leather-clad shoulders. "All I want to do is to lay my weary eyes on the plane again. What with these ghastly allosauri, diplodocuses and other monsters, I'm damn well fed up with this place."

Nelson settled his Winchester rifle more comfortably into the hollow of his arm. "Correct. So am I. But we can't say Altorius didn't do right by our Nell. Good Lord, what a triumph he gave us!" The dark pilot's smile flashed from beneath his neat, close-clipped black mustache. "Wait till Cartier gets a peep at those

diamonds he gave us."

Panting, the two halted by mutual consent. "Ever see so many stairs?" grunted Nelson. "Three more flights and we'll be into the tunnel; ah, there's the opening. I only hope these blighters haven't hurt the plane."

Before resuming the climb Nelson shifted his rifle, idly regarding the armored gunners just above; then suddenly he stiffened his wiry body with a sharp cry. "Look out, Dick! What the devil? Those damn fools ahead are swinging the retortii across our—"

The dark haired aviator's words were drowned out in a deafening, hissing roar that burst from the great retortii's throat, and his heart gave a great convulsive leap at the sight. Was this an accident—or treachery? An accident of course. Somehow he could not bring himself to think that Altorius would break his pledged word. Projected in a shimmering white arm the scalding death vapor shot across the staircase, its hot breath licking the faces of the startled and angry Americans, and quickly forcing them to turn and run downwards to avoid being scalded.

"What the devil are these idiots trying to do?" gasped Nelson, anxiously eyeing the red-crested warriors who, peering down through the blue lenses of their helmets, watched the khaki-clad aviators but made no effort to realign their retortii. "Hero Giles'll skin those fools alive if he hears of this. Guess we'd better wait a minute: they'll soon shut off the steam."

Shielding his face from the steam clouds that obliterated all view of the staircase above, Alden stood watching the billowing steam clouds in silent awe.

"Terrible, aren't they, Vic?" he remarked. "I've never seen those big fellows in action. They make the portable variety look like water pistols."

As the steam barrier showed no signs of abating, an uneasy gleam crept into Nelson's dark eye, and with jaw grimly set, he cocked the Winchester and turned with the intention of lodging a complaint at the next station below; but, to his utter dismay, he beheld bronze armored figures on the next platform now training their long-muzzled steam gun across the

stair. Even as he sprang back, the deadly white vapor hissed forth from the second retortii, completely barring further retreat down the stair. Like an icy flood the chill of impending doom invaded Nelson's soul. This was no accidental discharge, for with the slightest change of direction in the deflection of either retortii, death would descend upon him and his companion.

Swiftly speech became impossible, as the roar of the huge retortii was deafening; the two were lost in the heart of an opaque cloud which completely blotted out the copper-hued Atlantean sky. Hot blood surged into Nelson's head while he became aware of ghostly and stealthy figures advancing through the shimmering billows of vapor. Up, up, they came, like dream men, their eyes weird and unreal. Cursing the treachery of their late host, Nelson and Alden watched dozens upon dozens of hoplites come swarming up the stairs in solid, dully-gleaming ranks. Apparently intent to take them prisoners, the foremost Atlanteans made a rush, giving the American time to fire just twice.

Unable to retreat, the helpless aviators stood to meet the engulfing wave of hoplites. Nelson struck out as hard as he could at those yelling, red-bearded faces, though he knew the effort was hopeless. He was dimly conscious that Alden, not far away, also fought with the vigor of despair.

With a sense of savage satisfaction, the dark haired aviator felt his fist impact solidly into a yelling, sweating face; then something struck his head and, amid a miniature sunburst, his senseless form sank limply on the damp stones of the great staircase.

After an interval, the length of which he did not know, Victor Nelson opened his eyes slowly, for his head throbbed like a savage's war drum. Uttering a stifled groan he shut the lids to still an overpowering sense of nausea which gripped him, but a moment later he made another attempt to discover in what sort of place he found himself. Gradually, his eyes became accustomed to a curious orange-red glare beyond a series of bars. Bars? The idea fixed itself in his benumbed brain; bars meant prison! Yes, those grim blank walls bore out the assumption. He lay on the

damp stone floor of what must be a fairly spacious cell. Beneath his leather aviator's jacket he shuddered. "Jail, eh? What a nice place to wake up in!"

A groan from behind him prompted Nelson to painfully raise his head and look about. He blinked dazedly, meanwhile trying to focus his eyes, then he heaved a faint sigh of relief as his gaze encountered the muscular, well-proportioned figure of Richard Alden, who half sat, half reclined, against one of the grey stone walls, burying a ghastly pale face between trembling hands.

"You hurt?" To speak, Nelson drew a slightly deeper breath and at once became conscious of a horrible, throat-wrenching stench. Dimly, he recalled having once before encountered such an odor; when was it? Oh, yes; during the Great War when he'd stumbled into a dugout tenanted by long unburied corpses. A cold finger stabbed at his brain. Corpses.

"Are you hurt, Dick?" he repeated hoarsely.

The lax figure stirred and Alden's blonde head was raised slowly. "I don't know." His voice came very thickly. "I—I'm still dizzy. What's happened?"

"Damned if I know; but those bright boys have evidently heaved us into a calaboose of some kind!"

Nelson, on peering about, had discovered that one end of the cell was closed only by a series of massive bronze bars; the two other walls were solid masonry; while the fourth was also solid but fitted with a small oval door of bronze.

"Calaboose? The hell you say!" Alden coughed feebly. "My God, but that steam was terrible stuff. I nearly smothered before I got knocked out."

Slowly, the younger aviator looked about, and suddenly his eyes widened in an expression of indescribable horror.

"Look!" Alden's voice had died to a shaken whisper. "My God, Nelson, we're finished! Look at that allosaurus!"

Following the line indicated by the pilot's shaking forefinger, Nelson peered out through the series of great bars while a shudder shook his aching body. Though he had seen these fearful monsters on many occasions, yet it was never from such a position as that in which he now found himself. To his ears came a sibilant hissing like that of a thousand serpents; and, quivering in every nerve, he forced his eyes open once again, to discover that the cell which he and his companion occupied was but one of a series of cells surrounding a huge square in which were imprisoned perhaps twenty or thirty of those horrible, gargoylesque creatures which were the Atlantean dogs of war. Some thirty-four feet in length, the enormous, slate-grey monsters hopped leisurely about, their warty hides and huge luminous eyes betraying their reptilian origin. In shape the allosauri resembled loathsome and titanic kangaroos as they lumbered awkwardly to and fro, picking viciously at what appeared to be fragments of human flesh and bones.

While the two prisoners crouched paralyzed with horror, one of the nightmarish creatures came

hopping over and, pressing a head as big as a steam scoop against the bars, stared in with huge, pale green eyes. A long minute the ghastly creature remained looking in, clearly outlined by the orange glow from outside.

The doomed aviators found something fearfully fascinating about those narrow vertical irises set in pupils the size of dinner plates. Uttering a deep growl, the allosaurus shuffled nearer, and impatiently rubbed its huge, bullet head against the bars; then gripped the ponderous bronze bars with its ridiculously small front legs to shake the whole grille-work with a savagery that dislocated bits of plaster and made the metal reverberate. While Nelson and Alden shrank flat against the far wall, a scarlet tongue at least four feet long flicked the air but a few feet from their bloodless, sweating visages. Becoming irritated at the sturdiness of the barrier, the mountainous reptile tugged harder and hissed, filling the cell with a foul exhalation that stank like the reeks of smoldering rags.

Nelson's wavering consciousness reeled, and a mad,

dreadful fear, like that a dreamer suffers in the grip of nightmare, invaded his being. He felt the hairs rising on the nape of his neck.

But, with a squall of rage, the monster abandoned its futile efforts and leaped away. Feigning indifference, the allosaurus picked up a half-gnawed skull with its tiny forelegs; and, while the prisoners watched, it stuffed the head into a maw twice the size of an elephant's and crunched the gruesome tidbit as easily as a boy would a walnut. Presently it shuffled off to rejoin the hideous herd in the center of the court.

"Nice kind of a jail we've been thrown into. Wish I could understand what's happened." Alden buried his face in his hands. "It kind of looks as though Altorius had a change of heart."

Nelson replied nothing, but sat staring fixedly out into the horrible court.

"Somehow, I don't think Altorius would do such a thing," he said at last. "Let's think back and see if we can't piece this treachery together."

"Wish I had your faith in the Emperor—but I haven't." Alden's handsome face twisted itself into a wry smile.

"Let's see, now," persisted Nelson, fingering a square jaw upon which sprouted a thick growth of reddish bristles. "There was a deputation of priests to see Altorius yesterday. They were clamoring for the return of Altara—the Sacred Virgin—and looked pretty mad when he put them off."

"Maybe this is the private doing of the priests," admitted Alden. "Anyway, we're in one devil of a fix. There's certainly no way out of this calaboose—and those damned brutes out there look hungry."

Nelson frowned, deep in thought. "Wish I could find a reasonable explanation. I really don't think it's Altorius; still, that's what you get for mixing in on the politics of these forgotten kingdoms."

"But," reminded the other, "you had no choice, old lad. Remember, you mixed in to save me."

From across the courtyard rang a loud, penetrating

shriek of fear that made the two aviators spring to their feet and rush to the bars. Peering across the court, they discovered three naked men shrieking and clinging frantically to the bars of an exactly similar cell.

"What's wrong with them?" demanded Alden as the agonized screams rang louder still.

"I don't know," was Alden's breathless reply. "But what's that noise?"

A curious metallic clanking sound filled the poisoned air, and for a moment Nelson remained utterly puzzled. Then, as the noise grew louder, the allosauri commenced to betray a strange restlessness. They ceased basking and feeding, and their hideous heads commenced to dart quickly this way and that.

While the terrific shrieks of the wretches across the court rang to the copper-hued sky, the two Americans remained in doubt; then all at once the chill of death gripped their hearts, as they saw the bars of that cell directly opposite slowly but surely rising! Uttering

heart-rending cries, the doomed prisoners clung frantically to stay the vanishing barrier separating them from those appalling man-eaters. But, disdainful of their pitiful efforts, the bronze bars rose relentlessly with metallic rattlings and janglings from some unseen mechanism.

Rooted to the floor, both Americans watched the distant grille vanish into the upper stone-work and heard the ghastly hissing as the allosauri herd commenced to move forward. Sick and shaken, Nelson beheld one of the doomed men cling in desperation to the bars; he was lifted clear of the floor and borne towards the ceiling, meanwhile venting his terror with such screams as could otherwise have risen only from an inquisitor's torture chamber.

The tragedy was swiftly completed. Half a dozen of the nearest allosauri, taller than any giraffes, suddenly sprang forward, their long, naked tails rising as their gait increased. Snarling horribly, the vast slate-colored beasts plunged into the cell, terminating shrieks of mortal terror. Backs broader

than bus tops squirmed and tugged, then one of the loathsome monsters reappeared carrying in its dripping jaws a mangled, yet struggling victim much as a cat carries a mouse. In a trice the other allosauri came rushing eagerly up, seeking to snatch the prey from the first monster.

Nelson stiffened. "Great God! And that's what'll happen to us!"

Weakened by his head wound, and blind with nausea, he stumbled to the rear of the cell to collapse upon a pile of foul straw, littered with equipment which the superstitious captors must have condemned together with the owners.

Nelson sank upon them, then stiffened, for his outflung hand had encountered a hard, familiar outline. It was a .45 automatic pistol.

A moment's furious search revealed that the captors had missed or not understood the use of the weapon in Alden's leather flying coat.

"God, but we're lucky," Nelson panted. "The Atlanteans never saw this pistol of yours. They're only used to my rifle."

Hope lit Alden's features, then faded. "But what good is a .45 against brutes like those? Might as well have a pop gun!"

"Still we're lucky," grunted Nelson, delighted to find the magazine yet filled. "Can't tell what's ahead. Yes, we're the luckiest—"

He broke off in quick alarm. From overhead had come a premonitory clang! Somewhere a tackle whined and, with a sense of suffocation, both men realised that now the bars of *their* prison were beginning to creep up into a long slit in the stone ceiling!

Cold fingers of fear clutched Nelson's heart as the terrible allosauri, their jaws yet dripping redly, wheeled about at the familiar sound—to stand listening. Up and up crept the ponderous grille, while the allosauri commenced to shuffle forward, fixing on their next victims enormous, unblinking green eyes.

While the whole loathsome cell spun about, Victor Nelson forced stiff fingers to throw off the safety catch as the nearest allosaurus opened its cavernous mouth in anticipation, displaying an array of curved teeth, as long and sharp as bayonets. Standing some fifteen feet high at the shoulder the horrible creature's body was; it all but blotted out the light. The bars rose inexorably. Now they were waist high.... Now above Nelson's head.... In a moment would come the rush.

Richard Alden stood up straight and squared his shoulders. "Good-by, Vic," he said, in clear, unafraid tones. "I don't imagine that .45 will even tickle those ghastly brutes."

Nelson nodded. "All over but the cheering," he replied with that strange, macabre humor which often comes to solace men about to die.

"See you in church." There was an equally gallant lightness to Alden's reply.

The dark haired pilot, with a curious, detached sense

of unreality, stepped into the middle of the room, the automatic in his hand seeming no more potent than a water pistol, for a ponderous, lambent eyed monster was now hopping forward. While minute particles of dust and dirt rained down from the disappearing barrier, the foremost allosaurus opened its enormous jaws, uttered an eery scream and charged straight at the unbarred cell.

Drawing a deep breath, Nelson raised the .45, sighted, and, remembering his former experience, fired at the enormous right eye. As in a dream, he felt the recoil. The monster neither slowed nor swerved in the least, though its great, saucer-like eye disintegrated horribly. Immediately Nelson swiftly sighted at the other eye and fired, just as the allosaurus' shadow filled the threshold.

Crack! A swirl of bitter smoke stung the aviator's staring eyes. He'd hit; he knew it!

Cyclopean moments followed as the blinded monster dashed forward, missed the circular door, and, butting his head against the stone wall to the left, fell

completely stunned, effectively blocking the doorway with its huge body. One enormous hind leg, fully ten feet long, and equipped with three razor-like claws, projected into the cell and lashed aimlessly back and forth, forcing the two prisoners to dodge wildly.

There ensued that indescribable kind of a moment when men go mad. Outside the cell the ravenous herd pounced upon their fallen mate and with hideous grunts and snarls promptly commenced to tear it apart. The shaken prisoners realized that the rending jaws would before long undoubtedly remove the temporary obstacle; but meanwhile the hideous hissing and the fetid stench of the allosauri breath made the cell a mad-house.

Gradually, the gigantic carcass at the door commenced to quiver and roll violently under the ferocious tugs of the eager feasters. A gap of light appeared over the huge haunches, and, all at once, another of those terrible heads slipped over the carcass and into the cell.

Again the .45 thundered, lighting the darkened cell

with a brief orange flame. A noise like the furious trumpeting of a dozen elephants nearly blew Nelson flat as the wounded monster drew back its head, but the respite promised to be short, for the other reptiles only re-doubled their horrid, cannibalistic rending of the carcass. When the barrier was removed there would be a general rush which the shaken aviators could not hope to stay.

Suddenly, Alden uttered a low shout and pointed to the small, oval door which had, up to this point, remained securely bolted and shut. It was swinging gradually open, rimmed with a strong reddish light.

Wide-eyed, and with black hair streaming lank over his forehead, Nelson, in the act of reloading, swung about to meet this new menace. Hell! What point was there in prolonging the pitiful struggle? What was happening?

Slowly, the door swung back, and a rosy glow lit the opening, a glow that became as strong as the gleam of a spotlight. Then, slowly, a glittering, green-crested helmet of highly polished bronze appeared, and,

under it, Hero Giles' familiar features, now distorted by a terrible fear. The blue eyes seemed enormous. "Quickly!" he called. "Quick or ye are lost!"

Unbelieving of the reprieve, both the aviators stared an instant at that martial figure clad in brazen armor liberally studded with enormous diamonds and emeralds, then leaped forward with the speed of desperation, for from behind came a fierce squalling from the allosauri. As he darted towards the door Nelson had a glimpse of the carcass blocking the door commencing to slip sidewise.

Alden was already out and Nelson sped through the door barely in time to escape the razor-sharp talons of the foremost allosaurus as it scrambled into the deserted cell with a resounding bellow of disappointed fury.

Chapter 8

As the door clanged shut, drowning out the allosauri's furious screams, both aviators, shaken to the depths of their beings, could do nothing but stare about them in surprise. Completely surrounding and protecting the exit stood a double rank of hoplites in bronze armor. Like unreal automata, they remained utterly motionless, fixed in the various postures of an ancient Macedonian phalanx, their broad backs gleaming dully in the light of the neon flares. As in a dream, Nelson recognized on top of each spearsman's casque the graceful Atlantean military crest—a metal dolphin from the back of which sprouted a series of bright blue feathers, arranged like a dorsal fin.

"Thank Poseidon, ye still live!" cried Hero Giles, gripping their hands eagerly. "I had fear for ye, oh my friends."

Nelson grinned. "You cut the rescue act pretty fine, but of course we're damned grateful. And now,"—eagerly seizing the Hero's splendidly muscled arm—"in God's name tell us what's happened. Why we

were arrested and—nearly made into allosaurus fodder?"

Hero Giles turned from snapping an order to a subaltern who was peering down a great, shadowy hallway with a distinctly uneasy manner.

"Much," he said. "Scarcely had ye two departed from Heliopolis than the priests, mad with rage over Altara's continued captivity, dared to seize the person of His Splendor and proclaim a regency. Herakles, the arch-priest is—"

From far down the gloomy, vaulted corridor came a faint sound, rather like the distant cheering of a crowd. The hoplites, standing about, turned their helmeted heads and stared uneasily, their brazen armor glowing dully with each movement.

"I'll tell ye more later, but now—"—Hero Giles' voice took on a ringing quality like the clash of steel—"there is work to be done. To rescue ye, oh Hero Nelson, I slew the guards at the lower gate, for this prison lies in the hands of a caitiff rogue, Hero

Edmund, one who clings to the priestly party. We had best be off lest we be trapped and slaughtered like rats in a pit."

Very distinctly to the ears of the aviator now came the dull clash of equipment and the tread of feet.

"Forward! We must hasten to reach the podokos waiting below," cried Hero Giles, settling his ponderous helmet more squarely on his leonine head.

At once the escort of fifteen-odd hoplites commenced to move down the corridor to the left, their hands tightly gripping the butts of their retortii pistols. At their head ran Hero Giles, and by his side Alden and Victor Nelson, who gripped his .45 vowing never again to return to that ghastly cell.

A long ringing cry from the rear brought home the dread realization that the enemy had appeared. Looking back, Nelson could see the far end of the great corridor filled with menacing figures. Then his heart leaped like a deer in a thicket, for *from ahead* sounded the clash of weapons! The rescue party's

retreat was cut off!

Hero Giles acted with the speed of a veteran accustomed to emergencies. "Forward!" he roared, making the bare walls reverberate and rumble with his voice. "*Halor vàn! Ula Storr!*" (Make ready for your retortii.)

As by magic, there appeared before the retreating force a double rank of blue-crested hoplites who debouched from a side passage into the hall and clawed desperately for fungus bombs and retortii. Evidently they had not expected to come upon the invaders so abruptly.

"*Storr!*" Like a brazen trumpet's call, the voice of Hero Giles rang out the order to fire—which was instantly drowned out in the furious hissing of the retortii of his followers.

Ever watchful, Nelson fired at a gigantic officer who, avoiding the first steam jets, flung back his arms to hurl one of the deadly fungus bombs among the rescuers. Shattering the bronze helmet, the

American's bullet struck the Atlantean squarely between the eyes, but nevertheless the stricken officer's grenade rolled forward and burst among the hindermost of Hero Giles' followers. Instantly, the deadly green mold flung itself upon the nearest hoplites and in a moment they crashed to the smooth granite floor, the yellowish growths already sprouting from nose, mouth and ears.

In the corridor reigned chaos, for Hero Giles' followers were now turning the full fury of their retortii upon the rank of men barring further flight. With dreadful ease, the scalding steam struck dead the opposing warriors, stripping the flesh from their bones as easily as a boy peels a banana.

Amid the swirling white clouds, Nelson had ghastly visions of yellow skulls, of steaming accoutrement, of limp heaps of disintegrating bodies; then silence fell, and, before he quite realized it, he, together with Alden and three hoplites who had survived the disastrous fungus grenade, were bounding along after Hero Giles' glittering figure as he led the way down one passage after another.

Louder than ever rang the fierce cry from the rear. Behind him Nelson could see dozens upon dozens of yelling pursuers, and knew that if he were to live he must run as never before.

Into a succession of spacious rooms dashed the fugitives; on through deserted armories where hundreds of bronze helmets dangled in orderly rows; and across silent barrack halls.

Closer and closer sounded the pursuing feet, spurring the runners to an even more headlong gait.

All at once a door loomed to the right; into this darted Hero Giles and after him pounded the two Americans and three hoplites. In an instant the six men set their shoulder to the ponderous bronze door and swung it to, just as the hiss of a retortii on the other side rose above the mad, blood-hungry clamor of the momentarily baffled rebels. Gasping and sweat-bathed, the fugitives paused only an instant.

"We've gained a short passage," gasped the Atlantean wrenching off his helmet and breast plate. The veins

stood out in great blue cords on his forehead, for the weight of the armor could not have been inconsiderable. "Below wait our podokos."

Nelson stripped off his leather coat, following the example of the hoplites, who swiftly divested themselves of such cumbersome equipment as could readily be removed. Then, while the shouts of the thwarted pursuers swelled like a demonic chorus, and while feathers of steam crept under the great door, Hero Giles spun about and, with his short yellow hair gleaming bright, led on down another series of passages.

All at once the fugitives, now reduced by exhaustion to five, found themselves on a balcony overlooking the great valley of Atlans. Before them opened an enormous staircase and down this they dashed at top speed, infinitely relieved to be once more in the open air.

Running like hunted stags, the fugitives had descended but a third of the great staircase, when, from behind, came a sudden, menacing cry that

warned Nelson that the pursuers had, after going a longer way around, come once more in sight.

"Ah! Poseidon blast the traitorous Edmund and his varlets! See?" panted Hero Giles pointing to a huge arch from beneath which was issuing a glittering column of shouting, swift running warriors at whose head dashed a splendidly-proportioned figure that must be Hero Edmund.

With the speed of the hunted, Hero Giles bounded forward, taking three and four steps at a stride, his jade green cloak snapping out behind. Down, ever downwards over the endless flight of stairs the aviators followed him until, spent and panting, the hard pressed five plunged down a final circular staircase and so gained a courtyard where waited a detachment of armored lancers whose yellow plumes and pennons shone bright in the glare of the flame suns. Staring anxiously upwards, the troopers nevertheless stood to attention in an orderly rank beside those curious Atlantean mounts called podokos.

During all his sojourn in Atlans, Nelson had never become used to the hideous and awe-inspiring podokos which closely resembled the allosauri but were only eighteen feet long. Like the other monsters, they had tremendously developed hind legs which promised the speed now so vital for escape and safety. Ready in the tooth-studded jaws of each podoko was fitted a bronze bit together with a bridle and reins; and cinched up on each creature's back was one of those curious Atlantean saddles, which was built up at the cantle to overcome the downward slope of the podokos' spines.

Need for vital haste was but too obvious and, as he drew near, Hero Giles gasped the command to be off.

"Quick," he shouted, his scarred visage flushed and sweat-bathed. "Saddles! Speed! Speed! Cling fast as your beasts arise!"

All five literally hurled themselves into gorgeously caparisoned saddles. Instantly, the urging squatting podokos leaped to their feet.

It was the work of a moment for Nelson to wrench his reptile around, for already Alden and the Atlantean cavalymen were speeding across the wide paved court, their lance pennons fluttering bravely in the orange-hued glare.

At top speed the rescuers dashed for a great, oval gateway while the podokos increased their gait; like aero-planes gathering speed, the faster the weird creatures traveled, the higher arose their tails.

Then, following the frightened, backward glances of the hard-riding, red-haired lancers, Nelson suddenly discovered a new and terrible cause for this headlong flight, for, issuing from an unbarred gateway, came perhaps a dozen of *the terrible and enormous allosauri*, which, spying the fleeing cavalry, instantly gave chase.

With a sense of despair, the aviators heard the ferocious bellows booming from behind and watched the appallingly swift progress of those uncouth monsters as, leaping high into the air, the allosauri covered between fifty and sixty feet at a single bound.

"They'll get you," cried an inner voice in Nelson's being. "They'll catch you sure." But the small and lithe podokos, sensing death leaping up from the rear, stretched out their slender, snake-like heads, stood on tiptoe, and, pressing their small forelegs tight against their chests, commenced to run far faster than any horse could gallop. Nevertheless, the allosauri came bounding up like colossal kangaroos, uttering weird, screaming roars that brought a chill of imminent death to the fugitives.

Casting a quick glance over his shoulder, Nelson's blood froze to find an allosaurus not more than seventy yards behind, and making terrible exertions to close that slender gap! Nearer and nearer coursed the incredible monster, body rocking in its terrific stride, dreadful jaws wide apart—jaws that could, without an effort, cut a horse in half.

A fear such as he had never known racked Nelson's consciousness as he found he was hindermost of the cavalcade, which was strung out like a field of racers. The other riders crouched low in their saddles like jockeys, lances held straight out before them, and

furiously goaded their strange mounts with curious hooks. Nelson was vastly relieved to get a glimpse of Alden far in the lead, almost beside the Atlantean Prince. His podoko was evidently better than the average.

Faster and faster pursuers and pursued raced across level meadows, over straight, white roads and rolling grain fields. Wind whistled madly in Nelson's ears, filled his eyes with tears, and made his short, dark hair snap, but two huge allosauri were now not twenty yards behind and *gaining with appalling speed!*

On the verge of madness, Nelson hammered his heels into the podoko's scaly side and wished he dared let go the saddle horn to draw his pistol, but to loose his grip was to risk falling off.

Closer and closer! Two enormous nightmarish heads were actually snapping at the fleeing podoko's tail. Then fear must have inspired the reptile Nelson bestrode, for it put on a sudden desperate burst of speed which carried it past the next two lancers. In

passing he glimpsed the doomed wretches, pale-faced and horrified, as they frantically goaded their failing podokos.

A moment later, piercing screams from just behind assailed Nelson's ears, but when he looked to the rear once more it was to find that a wide gap had opened between him and the great monsters behind.

Evidently, the heavy-built allosauri were unable to long maintain the terrific pace set by the smaller and more agile podokos whose maximum speed Nelson judged to be well over sixty miles an hour.

The pilot's eyes narrowed on beholding, in clear relief and not far away, the majestic, whitish outline of mighty Heliopolis, whose lofty towers, graceful domes and frowning citadels shone pink under the leaping, blinding glare on Mount Pelion.

"We certainly picked a nice time to drop in on this God-forsaken country," grunted Alden as the walls of Heliopolis loomed near. "We seem to have crashed into the busiest days they've had in centuries. How many shots you got?"

Nelson, swaying to the steady trot of his podoko, hesitated.

"Only five. Damned if I know what's going to happen next. I suppose it all depends on Hero Giles. Looks as though the nobles were bent on restoring Altorius—if he's not dead by now."

Alden tugged powerfully at the strange bridle which controlled his beast. "The priests wouldn't dare kill him, but it surely looks like their rebellion has gained a lot of headway."

A moment Alden's clear, blue eyes swept the towering battlements, gorgeously-sculptured temples and curious stepped pyramids, which now loomed near at hand and cast their rugged outlines sharp against the copper-colored heavens.

"Maybe there's some way we can work this revolution trouble to help us," suggested Nelson, without enthusiasm. "If we could play off one crowd against the other—"

His remarks were cut short as the foremost lancers slowed before an enormous bronze gate looming ahead. On the vast main panel was a beautifully-wrought dolphin curling about a trident—symbol of the imperial power now so sorely tried. Beyond that gate, breathlessly mused Nelson, lay Heliopolis and an unknown fate.

Chapter 9

It would have taken no trained eye to observe that something very unusual had happened in Atlans. Some of Heliopolis' many wide streets were quite deserted save for several small, bright-red cat-like reptiles that the Atlanteans sheltered as pets, but in other thoroughfares large throngs of people milled uneasily about, while listening to the impassioned harangue of black-robed priests. Everywhere business was at a standstill, shops were closed and markets tenantless.

Riding at an easy hopping gallop, the aviators urged their green, scaly mounts to the side of Hero Giles, for here and there some wandering citizens, spying the Americans, would yell shrill curses and shake their fists. Reining in, Nelson demanded to know the reason for this unaccountable hostility.

"'Tis the work of our gentle and holy priests," explained Hero Giles with a hard laugh. "They have told the populace ye are magicians seeking to set other gods above Poseidon."

"Nonsense," rapped the American, looking about uneasily. "We've never given two thin damns about anything except getting back to our plane."

"So I know," was the Atlantean's preoccupied reply; "but this spawn of Herakles' temples speak loud, and the loutish populace hearkens to their lies!"

"But what the devil is all this revolt about?" broke in Alden. "Why were we arrested? You started to tell us at the prison."

Hero Giles frowned as he pulled his podoko into a gracefully carved gateway of green marble. "There's but little to add, for 'tis all very simple. The priests have laid impious hands on His Splendor, Altorius, and imprisoned him in the great temple of Poseidon. We nobles have defied the arch-priest, for the dog-conceived Jereboam already marshals his forces for a fresh attack, knowing that Atlans is sore beset by internal strife. Have patience for now we go to the council chamber, where ye shall hear everything."

To say that the newcomers found the council of nobles

in a furore would be to put it mildly. Their angry voices carried far down the beautifully ornamented corridors of the Imperial Palace, which was used as headquarters.

"Sounds like a dog-fight going on in there," muttered Alden anxiously. "Don't like the sound of it a bit. I hope they feel kindly towards us."

Nelson, swinging along with his ragged shirt fluttering like a scarecrow's, nodded. "Yes, so do I. But I guess they need our help or Hero Giles wouldn't have risked his life to save us."

Conscious of the value of appearances, the dark-haired aviator unconsciously straightened his frayed black tie, buttoned the sleeves of his khaki flannel shirt and otherwise made pathetic attempts at improving his appearance as the clamor of wrangling voices grew loud down the corridor.

His wide shoulders swinging to his stride, Hero Giles flung open a door, beautifully wrought with leaping podokos, and halted on the threshold.

"Death!" rumbled a voice from inside. "I say death to the Wanderers! Let us make our peace with the priests, lest they slay His Splendor forthwith."

"And that's what I call a nice friendly greeting," was Alden's murmured comment. "Better get your gat handy, Vic. I'll bet they've got a reception committee of retortii men behind the door."

There was no time for Nelson to reply because now the threshold was at hand. Inside, seated at a table, he had an impression of perhaps ten or fifteen scarred and angry-looking veteran nobles whose green cloaks and bejeweled armor revealed their high rank.

In mid-dispute they halted, eyeing the three figures in the doorway with curiously conflicting expressions. Some smiled a relieved welcome, some stared in surprise, but not a few greeted the Americans with lowering brows and angry, threatening eyes.

"Harken," Hero Giles greeted them. "By Poseidon's grace the Wanderers were saved from a vile death.

Rise Heroes, and bid them welcome!"

"Ah, the Wanderers!" In an instant Hero John was wringing Nelson's hand. "Oh blessed hour! I had feared for ye both. Welcome, Hero Alden!"

A faint flush crept over the young man's wan and trouble-lined face. "'Tis well ye've come," he whispered. "The council was prepared to change their intent towards ye."

A grizzled, one-eyed prince arose, and leveling an accusing forefinger at Nelson shouted, "'Tis he hath caused the rebellion. Slay him!"

"Nay!" thundered the Hero Giles, "and forget not, Hero Paul—I am senior Prince of Atlans!"

In the great white marble council chamber silence fell, while from wonderfully carved ivory and gold chairs the harassed, yellow-bearded princes regarded the two uneasy Americans.

"Hearken, Hero Giles!" rasped another dark-browed

officer in a plain, much-dented red breast plate. "I side with Paul. Away with them, I say! Time is too precious. Do not the dark hordes of Jereboam beat back our frontiers?"

Hero Giles glowered and sat bolt upright in his chair—a strange disordered figure among his gorgeously robed and armored peers. "Thou wert ever a hothead! I prithee pause a moment! Remember how the dark-haired Wanderer once aided our imprisoned Emperor, whom Poseidon protect! Perchance, Hero Nelson and his friend once more can aid us in this, our hour of need."

A chorus of variously opined voices broke out, while Nelson with an eye to possible violence stood ready.

"Silence! Sirrah!" The fierce old veteran banged a powerful fist on a golden dolphin head forming his chair arm. "This idle wrangling accomplishes naught, and a thousand weighty matters await our attention. Is it true the phalanxes at Tricca have risen for the priests?"

Before Hero Giles could reply, a stalwart guard at the door flung it open to admit a dust and sweat-bathed courier who, darting forward, flung himself at Hero Giles' no less dusty feet. While the yellow-haired Prince started back muttering in amazement, the runner raised a shaking hand.

"Woe, woe to Atlans!" he panted. "Jarmuthian retortii men have crossed the boiling river. Cierum is fallen! Its garrison is drenched in clouds of fungus gas. But a handful escaped!"

"Speak on: is that all?" A terribly intent expression crept over the aquiline faces around the council table.

"Nay, spare thy servant!" begged the green kilted courier, raising sweaty, imploring hands. "I—I dare not—"

"Speak!" snarled Hero Giles, his blue eyes terribly lit. "Speak!—else thy carcass shall be flung to the pteranodons."

Wild-eyed, the fellow blinked fearfully about. The

grim-lipped nobles edged closer. Nelson, realizing all that lay at stake, watched intently, conscious that Alden was now by his side.

"I—I, Her Sacred Holiness, Altara—." The messenger's red face twitched and he choked as in terror.

"Altara!" The name reechoed weirdly from a dozen dry throats, and Nelson saw the skin suddenly pale and tighten over Hero John's face.

"What of the divine Altara, fool?" he thundered in a dreadful, shaken monotone. "Have those foul swine of Jarmuth dared—?"

"Forgive, oh Hero!" cried the groveling courier, his long red hair sweeping the marble floor. "The dog-sired Jereboam hath made proclamation in Jezreel that the Sacred Virgin is doomed to perish on the altar of Beelzebub, their demon god, in two days' time!"

"What?" The great marble-walled chamber was

shaken by an unearthly outcry as horror and rage struggled for mastery in the circle of tense faces surrounding the momentarily forgotten aviators.

Bedlam broke loose, while Hero Giles sat as though stunned, staring on the shivering runner at his feet.

Nelson, very much on the alert, could see that the announcement of Altara's impending death had produced nothing short of a cataclysm in the plans of the council.

Like men paralyzed by electric shocks, the yellow bearded veterans and nobles sat stupefied, frozen in their last gesture. Then, in the midst of their silent despair, came the sound of a curious, high-pitched horn that had in its note something of the eery wail of a fire siren. The effect was magical, for the nobles sprang up, hands on sword hilts and eyes searching the corridor.

"The priests!" gasped a short, broad-shouldered noble at Altorius' left. "By Poseidon! 'Tis the fanfare of the Herakles himself."

Then indeed did the council glower, for, as Nelson soon learned, Herakles was the moving spirit and evil genius of that priestly party which had dared to imprison the Emperor.

Again the horn wailed its warning of the arch-priest's approach, whereat a stalwart hoplite in green painted armor clanked in, saluted stiffly and waited for Hero Giles' instructions.

"Bid the old man enter," directed the Prince at last. "Tell the graybeard he has naught to fear if he comes alone. Otherwise, bid him return to his kennel in the temples."

A moment after the hoplite had vanished, there appeared in the doorway a tall, emaciated old man on whose silvery head was set a curious golden mitre ending in the shape of a wondrously bejewelled trident. The curious Americans noted that the arch-priest's robes were as black as his evilly glittering eyes, and were embroidered with curious cabalistic symbols done in silver thread. In his withered hand Herakles carried a ceremonial trident—the mark of

the Head Priest of Poseidon.

As though wary of advancing, the arch priest paused in the doorway, not three feet from where Nelson stood poised for action.

All at once the gaunt figure in black raised thin hands to the dome far overhead and cried in high-pitched prophetic tones:

"Woe to Atlans! When perishes Altara, virgin of Poseidon the God-head, then shall a darkness fall on Atlans! Her cities shall be cast down, there will be a weeping and wailing in the land, for Beelzebub and his followers shall prevail! Woe to Atlans and woe to ye all, blasphemous nobles!"

Gripped by a superstitious awe, the generals and nobles fell into an uneasy silence, fearfully lowering their eyes and then glancing askance at the plain khaki clad figures standing alert in their corner.

Nelson, defiantly meeting their eyes, beheld Hero Giles staring fixedly before him, his powerful

shoulders bowed as though bearing an overwhelming burden.

Deeper grew the silence of disaster while the American furiously searched his mind for some means of thwarting the death in store for him and his companion. By chance, a word of Hero Giles recurred, the "pteranodons." What in the devil was a pteranodon? He turned sidewise to Alden who stood, hands in the pocket of his leather jacket, also thinking deeply.

"Dick," he whispered. "You studied paleontology at college. Do you remember what a pteranodon was?"

"A what?" The younger aviator seemed to make a definite effort to return to the present. "A pteranodon? I'm not sure, Vic, but I think it was a kind of flying reptile related to the pterodactyl group."

He could go on no further, for Herakles, the arch-priest, raised his snowy head suddenly, his eyes blazing. "To save Atlans in her hour of trial, we

demand that ye deliver to us the Wanderers. They shall die as an offering to Ares, God of War. Perchance he will preserve us." The arch-priest's deep-set and glittering eyes swept with venomous hatred the two calm-featured aviators, who looked very plain and unromantic in their flying jackets and khaki serge. "We, familiars of the Gods, herewith demand that the blasphemers perish on the War God's altar! Else shall ye all die unbeloved of the Gods!"

"And we do your bidding, will ye give us back His Splendor?" demanded Hero Giles.

"Nay—we priests do not bargain like hucksters."

Risking all, Nelson muttered a swift aside to Alden. "How big were those pteranodons?"

"Some species had a wing spread of twenty-five feet."

The muscular pilot's mouth closed into a firm, colorless line as he nodded and glanced at the vindictive old man who was by now white with fury.

Up sprang a good three-quarters of the nobles present and turned on the grim figure at the head of the board.

"Surrender the Wanderers!" they shouted. "We demand it!"

In another instant the death sentence would have been forced on Hero Giles, but Victor Nelson leaped forward, pistol menacing the raging gray-bearded priest.

"Listen, all of you!" he shouted in deep tones that were strangely authoritative. "Beware, foolish Princes, how you threaten us. Great is our knowledge and power: you've seen that already. Even now, the other Wanderer and I can save or ruin Atlans, as we wish! Have ye forgotten the battle by Lake Copias?"

The Princes, furious at the American's defiance, half rose, hand on sword hilt, but sank back at a swift, menacing gesture from Nelson's pistol.

"What sayest thou, mad fellow?" screeched the arch-

priest, his black eyes bright as knife points. "Save Atlans—?" Fierce questioning was in his sombre, sunken eyes.

"I said," repeated Nelson, "that, if we choose, we can yet save your Altara and the Emperor from death."

"Impossible! He is mad!" shouted Paul, the one-eyed Hero. "Not the Gods themselves could rescue Altara from the claws of the demon Beelzebub!" The nearest nobles flung themselves back in their chairs and snarled threats of all kinds as they gripped their sword hilts.

Sensing an inescapable climax, the khaki-clad American raised his pistol, covering Hero Paul, the speaker. "Silence!" he rasped. "You're a thick-headed idiot not to see the truth. Can this priest save Altara? No! You know damned well he can't! And yet you'd have us killed."

"Now, Herakles," he swung on the priest, "about this Altara matter—if you'll restore Altorius unharmed, guarantee our safety, and punish those liars who

condemned us to death, the other Wanderer and I will undertake to not only prevent the sacrifice of Altara, but to bring the Princess back as well!"

To all this Alden listened with increasing and indescribable dismay, his blue eyes round as marbles. "My God!" he whispered in an undertone. "What in the devil is Vic doing? *Undertake* is *right*, the crazy fool!"

"How will ye accomplish this mad boast?" demanded the arch-priest in deep suspicion. "Know ye that the Sacred Virgin lies captive in the dungeons of the great temple of Beelzebub? Know ye that this temple is in the center of Jezreel, capitol of Jarmuth?"

"I had some idea that was the case."

"Know ye," continued, the graybeard priest, "that Altara is ever guarded by two thousand picked priests and warriors? Know ye, moreover, that this vile sacrifice will be made but two days hence?"

The aviator's lean, dark head inclined with a serenity

he far from felt.

At this point the scarred veteran officer who had spoken before broke in, his face menacing. "Believe not this liar, oh Hero Giles! He speaks with a tongue made bold by fear. He promises that which he cannot accomplish!"

Had Victor Nelson had time to reflect upon the weirdness of the plan he had evolved, he would probably have silently admitted that his grizzled accuser was more than a little justified, but as it was he smiled serenely.

From all sides rose a threatening shout. "Let the blasphemers be sacrificed. Ares will protect us!"

His yellow brows knit, Hero Giles wavered, but as he hesitated there ran through a great circular window a distant yet menacing shout. "Down with Altorius, the Unlucky! Down with the sons of Hudson! Give back to the ancient Gods their Sacred Virgin. Hail to Ares!

Death to the Wanderers! Death! Death!"

Drowning out these ominous cries there came from below the window the brazen clang of trumpets and the clank of many armored men hurrying forward. Presently the mob's outcry grew fainter, but still the cries of "Death" could be heard.

It was a tense moment. Would Hero Giles remain friendly? With poignant anxiety, Nelson watched that dishevelled martial head sink forward in perplexity.

"Hero Giles," he warned, in a low voice. "You'd better trust us. You're risking nothing."

Slowly, the fierce blue eyes of the veteran rose, and, meeting the level gray ones of the aviator, lingered there as though asking a question. Suddenly reaching a determination, he rose to his feet and addressed the triumphantly grinning arch-priest, who tightly clutched his trident wand with thin, blue-veined fingers.

"Hearken, black crow of a priest, who has dared lay

foul hands on His Splendor, the Emperor. This is my reply: show me how ye will rescue Altara; otherwise begone! My hand itches for the sword."

A deep silence fell while Herakles glowered helplessly, then shrewdly avoided the trap. "This is blasphemy!" he croaked and raised a quivering forefinger in solemn warning. "Woe to thee, Hero Giles. Woe to the people! Fear the wrath of the Gods!

"Jeer not, ye nobles!" Herakles stormed on. "Be not deceived by lies! I bid thee deliver these magicians to Ares, God of War!"

A nasty moment; Nelson's heart drummed as he gazed down at the row of uneasy, war-like faces, but Hero Giles proved the strength of his heritage. Back went his patrician head; he drew himself up to full height and stared coldly upon the black robed priest, who, nothing daunted, gave back look for look.

"Nay! We keep them: they will bear out their promise. I give ye good day, oh Holiness!"

Quivering with rage Herakles raised his withered hand in anathema. "Then perish, blind spawn of Hudson! Verily shall ye all die under the torture. Woe! Woe! Woe!"

Then, amid a strained silence, pregnant of distrust and disaster, the old man wheeled and stalked out.

As he watched the departure, color drained from the Atlantean prince's haggard features. "Ah," he observed bitterly, "ever have these black crows feasted on our land, and ever as birds of ill omen." He turned and, with a weary sigh, surveyed the group of loyal, but anxious souls. "I thank ye. Will ye still do my bidding and help to save our sovereign lord?"

Out flashed the swords of a dozen-odd nobles as they raised the hoarse, ringing cry of "Altorius! Altorius! Supreme!"

A little later Nelson, before a very mistrustful gathering composed of Hero Giles, Hero John and two or three other veterans, traced the barest outline of his plan.

"You understand? I'm to be taken to the border as a prisoner; then, in plain sight of the enemy lines, the guards must maltreat me and turn me loose."

The aviator searched one after another of the brutal, war-like faces, while Hero Giles translated for the benefit of two Atlantean generals who did not speak the royal language.

"Are you positive," Alden demanded of Hero John, "that this revolution in Atlans will die out if Altara is returned?"

"Yes! A thousand times yes!" The prince's fine eyes gleamed with savage enthusiasm. "With the Sacred Virgin restored to Atlans, new courage will come into the phalanxes! The priests will cease their outcries against them. Then, with the help of the blue maxima vapor, we will rend the dog-begotten followers of Jereboam limb from limb!"

"All right." Nelson's wiry khaki-clad body bent far over the table. "Remember, Hero Giles, that part of the fighting's up to you. When I'm gone, you'll do

exactly what Alden tells you. Now, one thing more: what part of the border is still unquestionably loyal?"

Hero Giles frowned and shrugged his armor-clad shoulders a little helplessly beneath the splendid cloak of imperial green. "The gods alone know; but at the third division of this morning, Mayda and Thebes still vowed their loyalty. 'Tis there are quartered the phalanxes of the Imperial guards. They alone can I trust to the death."

"All right." Bending over a huge parchment map of the valley, Nelson nodded, and his keen black eyes became very serious. "I want you to concentrate every man you can muster in each of those cities. Meanwhile tell the populace,"—he drew a deep breath—"that Altara will certainly be returned to them."

"Art thou sure?" broke in the scarred veteran in the dented breast plate; then, his brow dark with doubt, he engaged Hero Giles and the rest in a heated, low-voiced colloquy.

Alden stepped near, an anxious frown on his unshaven

features. "Think this idea of yours is sure-fire?"

"No," Nelson's lean head shook. "I'm far from sure. It's a wild gamble at best, but we can't be any worse off than we are now. If the priests win out, we're sunk and no mistake about it; but there's a fighting chance my idea could be brought off."

"Now look here," objected the younger pilot tensely. "What's this rot about your going into Jarmuth alone? How d'you know they won't skin you alive once you're over the border?"

"I don't," admitted his friend, shrugging slightly. "But I don't see there's anything but to take the risk. If I don't go over there, sure as shooting we're going to feed some damn unpleasant kind of beast here in Atlans.

"Another thing," Nelson said, turning to the Hero who, surrounded by the others, was bent in deep consultation over a map. "How am I to know Altara if I see her? Is there a statue, a painting or something —?"

The Hero's aquiline features lit in a slow smile. "Nay, we have better than that. Come, thou shalt see the Sacred Virgin as she now is."

The members of the conference followed Hero Giles down a short corridor, through a couple of doors and into a chamber where a huge disc of crystal stood on edge fixed upon an axis above a bewildering array of wires, pipes and gauges.

Hero John, who seemed familiar with the mechanism, turned a lever, whereupon the disc commenced to spin like a pie plate on a dance floor. Faster and faster it spun, silently gathering speed each second while a low humming sound filled the chamber. Gradually the outline of the whirling disk commenced to brighten, tinting the scar-seamed, craggy features of the Atlantean generals and picking glorious, glowing lights from the jewels on Hero Giles' wonderfully engraved breastplate.

"Ah." Hero John turned a small dial. "The crystal warms. Look, oh Wanderers!"

Nelson rubbed his eyes incredulously, for in the heart of the shimmering circle had materialized the outline of a room with walls of yellow marble.

"Well, I'm damned!" gasped Alden. "See how it flickers!"

As the revolving disc of crystal gained top speed, the flickering subsided and a picture, clearer than most photographs, could be seen in the center. A wondrously slender, yellow-haired young girl clad in Grecian robes of pale blue sat in deep despond upon a plain wooden couch, with a black haired servant kneeling before her, apparently lacing sandals on her tiny, pink-hued feet.

"Bring closer the face," snapped Hero Giles gruffly.

Gradually the focus changed, like the close-up of a movie camera, until in the center of the madly whirling disc could be seen in minute detail and living color the face of an indescribably lovely girl.

"Whew," muttered Nelson, staring in silent

amazement. "No wonder they want her back! She makes Ziegfeld's little girls look like Armenian refugees." He cast a sidewise glance, but Alden had apparently not heard him; the younger American stood gazing with rapturous joy at the girl.

"Aye! Aye!" The two veteran generals uttered stifled groans and one of them drew a hand across his eyes. "Poseidon save her! Aye! Preserve the fair Altara."

"Wouldst thou not doubly save her, now?" demanded Hero John in a low voice that bespoke his anguish. He seemed suddenly older than the grim, helmeted veterans to either side.

"You bet! I guess a man sees a face like that only once in a lifetime. And now," Nelson continued with an effort to return to the practical, "there's no time to be lost—so I'd just like to take a look at those pteranodons of yours."

A few minutes later, the two aviators found themselves nearing a lofty structure which adjoined the imperial palace. It was constructed along the lines

of an immense aviary. Between beautiful, glistening Ionic columns of white marble, gleamed bronze bars, set at regular intervals to prevent the escape of the most appalling creatures which could ever have skimmed the air.

"What in the devil is your idea?" demanded Alden, taken aback. "God, look at the loathsome brutes!"

Some of these huge, flying reptiles were hopping awkwardly over the ground picking at bones and refuse littering the floor with long pelican-like bills, which were, however, very much thicker than those of pelicans, and set with sharp teeth at least six inches long.

"Not very pretty are they? Kind of look like huge bats," commented Nelson thoughtfully. "Wonder if they could be handled?"

"Yes, their wings are leathery. Look at 'em up yonder." Alden pointed to the roof of that immense aviary where, hanging head downwards like gigantic bats, must have been hundreds upon hundreds of the

pteranodons. One of them, whistling oddly, fluttered up to the bars, affording the Wanderers an excellent view of a loathsome head, the back of which ended in a curious sort of horn, that, projecting backwards, jutted far above its rear. Fierce, vermillion eyes with green irises glared at the Americans through the bars, and great wings of greasy-looking leather fanned a disgusting stench from the interior of the aviary.

"Sweet little things," was Alden's comment. "God! Imagine having one of those great things swooping down on you. Hey, Alden, look at that big devil over there! He must have a wing spread of thirty feet. Big as a Moth plane, isn't he?"

For answer the pteranodon clattered its vast beak savagely. One of the generals stooped and, catching up a huge slab of meat from a basket nearby, hurled it through the bars into the gaping jaws.

"What would ye with these creature?" demanded Hero Giles with undisguised curiosity.

"You'd be surprised." Nelson was not deliberately rude, but his mind was wrapped up in the daring project he had evolved. "I want a couple of the biggest of these caught and set aside in a courtyard where there will be no one looking on. If your people can train and handle podokos and allosauri—I guess a couple of Yanks ought to be able to manage these flying nightmares. So don't you worry about us."

Hero Giles uttered grim, significant laugh. "Thou hadst best manage them. I note yonder pteranodon is in need of nourishment."

Chapter 10

With sharp anxiety, Victor Nelson kept watching the towers of Jezreel rise ever clearer above the great, warm plain of Jarmuth, but, for all that, he noted how distinctly Jezreel differed from Heliopolis. The Jarmuthian capital was predominantly amber-yellow instead of white in color; its towers were flat-topped, angular, hideous structures that compared not at all favorably with the graceful Grecian architecture of Atlantean public buildings.

The populace, he decided, as he strode along in the midst of half a dozen silent guards, were as harsh and graceless as their architecture. Whereas the Atlanteans had been white skinned and uniformly red haired—save for those of Hudsonian blood—the inhabitants of Jarmuth almost without exception were black haired and had dark, olive-hued skins.

"They're the lost tribes of Israel, all right," Nelson decided after a brief sojourn in that savage land lying beyond Apidanus—the great boiling river, whose bubbling and scalding currents had for centuries

served as a natural boundary between the two realms. But now the Jarmuthian armies had crossed it and were steadily pushing back the demoralized and despairing Atlanteans with savage energy that heaped the dead in hillocks.

"Their armor," mused the ragged, barefoot prisoner, studying his silent guards, "looks a lot like a Roman legionnaire's, but that six pointed star on their helmets is pure Semitic. Yes, this sure is an Asiatic outfit."

His eyes wandered from one fierce, big-nosed infantryman to another and noted the splendid physical structure of the majority. Evidently hardier, much less refined and luxury-loving than the Atlanteans, these swart warriors disdained robes and other garments. Save for helmet, armor and brief black kilts, they were quite naked. Like the Atlantean hoplites the infantrymen carried spears, steam retortii and quantities of grenades.

The country side through which the prisoner passed had a holiday air, for garlands of flowers hung in

every doorway, and naked, pot-bellied children squatted by the roadside, industriously weaving crowns and streamers of gay blossoms.

"Look, Atlantean dog!" commanded the black-bearded leader of the escort. "Let thine infidel eyes gaze upon the mightiest city of the world. Seest thou yonder Ziggurat which o'er towers all others?"

Nelson raised eyes red-rimmed from sleeplessness and deep anxiety—for the crafty Jarmuthians had proved unexpectedly unwilling to credit him as the Atlantean outcast and would-be renegade he had pretended to be.

"Yes," he said in reply to the English-speaking *jehar's*—captain's—question. "What's it for?"

"'Tis the temple of the almighty Beelzebub, Steam God of Jarmuth. Without his hot breath no wheel would turn, our armies would be powerless and this land would perish under the ice of the outer world." The dark eyed officer's eye fell speculatively upon his bound and dust-covered prisoner. "Perchance, dog of

a spy, thou wilt die during to-day's fourth division(2) together with Altara, pale daughter of the feeble, false god Poseidon."

The Atlantean day was divided into six divisions of four hours each; due to the flame suns there was no sunrise or sunset.

This afternoon?

Nelson could not realize that the time had flown so quickly. Four short hours separated him from the crisis of his life. A thousand doubts assailed him. What if Alden or Hero Giles failed in their share of the great scheme for rescue? Narrowly, the aviator's eye searched the great, rich plain, then swept the amber-hued sky where, far above the plain, Jilboa, the nearest flame sun, beat off the Arctic chill and darkness.

The great, black-bearded jehar eased the straps from which was suspended the brass coil of his retortii. "Aye," he chuckled, his thick lips parted in a crafty smile. "Ere long will the fair flesh of Altara grace the

ceremonial board of His Exaltation, the King, and his priests and princes."

Nelson gasped in horror. The divinely beautiful Altara—butchered for meat like a calf? Grotesque! Ghastly! "What! You eat your prisoners?" He felt sick, nauseated.

For answer, the swart Jarmuthian raised an enormous hand and dealt the captive American a stinging cuff which made his teeth rattle.

"Peace!" he snarled. "Else I slit thy spying throat ere we pass yonder walls."

Fingering a short blue-black beard that was frizzed into tight curls in the Assyrian manner, the jehar lengthened his stride as the little detachment clanked into the shadow of a great wall surrounding Jezreel, and through a huge gate guarded by two hideous, jackal-headed effigies.

Hurrying into the city were throngs of eager men, women and children, interspersed with muscular,

black bearded soldiers who cast threatening, baleful eyes on the pale-skinned prisoner.

At first the great metropolis of Jezreel seemed boundless, for everywhere arose tall, massive monuments of yellow marble whose facades were engraved with Sanskrit characters, thus bearing out Nelson's surmise that this was indeed a race of Semitic origin.

Here and there hurried grey-bearded, vulture-eyed priests oddly garbed in corrupt Occhive and Tyrian regalia. Nelson found it odd to see the Tablet of the Laws, which Jarmuth so openly ignored, swaying on their yellow robed breasts; and none cried out more menacingly nor more loudly against the limping, wan-faced captive, than these same ecclesiastics, who must have long since forgotten all worship of Jehovah in the foul service of a bestial golden effigy.

A stone sailed through the air, narrowly missing the American; then another, which struck his shoulder.

"God, what a rough looking crowd," thought Nelson,

as the guards, cursing, held back the screaming mob. "At this rate I won't live to even reach the temple!"

Every second his life stood in great danger. Unkempt, sloe-eyed women hurled themselves, shrieking with fury, against the armored chests of the guards, who were hard pressed to beat them off with their spear hafts.

Nelson's one small ray of comfort in this evil hour was the fact that his .45 pistol remained untouched in a food wallet. At the border the jehar had cast one contemptuous glance at the weapon, but, no doubt deeming it some strange culinary tool, he had made no effort to remove it.

It was a continual struggle for the guards to win their way up a long flight of stairs, for ever the great stream of humanity grew denser and more menacing.

Nelson felt a violent sense of revolt grip his being. "I must win free," he thought. "If I fail, Alden dies, and—and—" For the first time he realised how much he wanted to actually see Altara. Like a clear cameo, an

image of her had remained fresh in his memory. Except for her Grecian garments she might have been a lovely, carefree English or American girl.

"And these decadent swine would sacrifice her!" The thought was sickening. Yet how could he prevent the pitiful tragedy?

Fortunately, a detachment of troops—tall, sinewy fellows with conical helmets, crested with six-pointed stars—reenforced the guards just as clawing hands began to snatch and tug at the prisoner's ragged Atlantean chiton of blue cotton.

Almost before he realized it, Nelson was dragged inside a great gloomy building and into a circular chamber where four eagle-featured elders sat in council beneath the six-pointed star of Sem. On approaching, the jehar in command sank on one knee and in humble salute raised both hands to the tribunal.

"A tough looking desk sergeant they've got," muttered the prisoner to himself as his eye met the chilling

regard of a lean, yellow-faced priest. "Wonder what I'm booked for?" Idiotically, he recalled being summoned before a traffic court, years back. "Guess I don't get off with vagrancy; it'll probably be everything from speeding to mayhem, with maybe arson and well-poisoning thrown in."

The deliberations of this ominous court proved to be appallingly short. The dour-faced elders merely put their heads together, muttered a few sentences, then straightened up almost immediately. The chief priest—he with the yellow face—thrust out his fist and made the immemorial signal of death by jerking his thumb at the black marble floor.

Before the outraged and astounded aviator could utter a word of protest, powerful guards seized and hauled him off down a dark, narrow passageway in which the fetid prison smell was very strong. Too wise to struggle against overwhelming odds, yet appalled at the thought of his impending doom, Nelson was dragged into a room where four or five furtive, enslaved Atlanteans, made dumb by the removal of their tongues, were engaged in a curious occupation.

On a bare stone bench, five other Atlantean captives were sitting in miserable silence. They made a grotesque array, for their heads were crowned with gay yellow and blue flowers, and the upper half of their perfectly formed bodies gleamed with an application of a sweet-smelling oil. About their wrists and waists were twined fragrant garlands of yellow roses which hid the leather straps confining their hands.

Struggling, Nelson was forced on to the bench, whereupon slaves, skipping to avoid the lash of a scarred, olive-hued slave driver, hurried to wash the newly arrived prisoner's limbs, face and hands. A weary-looking old slave with sunken, rheumy eyes listlessly pulled the blue chiton from Nelson's broad shoulders, and would have removed the food pouch had not the prisoner winked vigorously. The ministering slave glanced swiftly sidewise and, discovering the slave driver's attention directed to another corner, pulled the upper folds of the chiton over the food pouch and its precious contents, then set a crown of yellow roses more or less askew on the American's head. For all the peril of the situation

Nelson could not suppress a fleeting smile as the phrase, "For I'm to be Queen of the May, Mother," leaped nonsensically into his brain.

"Yes, I guess they are getting us all dolled up for a sacrifice of some kind." Nelson's heart began to pound at the thought. Then he fought for self control. It must be a hideously realistic nightmare! He, Victor Nelson, American citizen, a quiet birdman, member of the Caterpillar Club and ex-flight commander of the A. E. F. was about to be offered as a sacrifice to some hideous, pagan god? Nonsense! He'd wake up in a minute and hear the drone of a ship on the line.

He blinked, staring fixedly at a single ray of light that came streaming in through a small, barred window, then glanced sidewise at his fellow victims, who with Spartan indifference sat waiting for the end of all things. It was no dream!

From the tiny window came the shrill discordant braying of many trumpets, and a roar like that of a football crowd arose surprisingly near. In response, the slave driver lashed the gaudily bedecked

sacrificial victims to their feet with vicious cuts of his pliant whip, and herded them like a drove of calves down a very long passage, lit at intervals by those strange column lamps of incandescent gas. In their red glare the doomed six seemed as though already bathed in blood.

"Must be some crowd of people outside," muttered Nelson as a great gale of sound deafened him. Yonder the amber glare of the flame suns glimmered, and now it was his turn to step into the open!

On a sort of spiral roadway he paused, breathless, awed, bewildered, for there, eddying restlessly about the bases of towers and other huge structures, was a great sea of up-turned faces. To his surprise he found the passage he had followed opened perhaps halfway up what must be the great Ziggurat of Beelzebub. He judged the tower's height must be immense, for already the crowd was a good hundred feet below.

"Zarotoa! Zarotoa! ù Wlanka!" (Death to the victims!)

Nelson shivered. How terrible was the wild,

bloodthirsty clamor of that vast throng, when they beheld the six flower-decked prisoners appear upon the circular winding road which led to the lofty and wind-swept summit of the great conical pyramid of the people of Jezreel.

Behind the victims marched perhaps eighteen or twenty spearmen gorgeously uniformed in yellow and black painted armor. Their retortii were plated with gold, and in the center of a star forming the crest of each helmet was set a diamond large as a hickory nut.

Preceding the despairing prisoners marched a squad of tall, clean-shaven priests with great gold hoops in their ears. They blew mightily upon long, curved horns, and were followed by perhaps a dozen lithe, posturing girls, half clothed in diaphanous yellow robes. These priestesses swung golden censers which flung bluish clouds of aromatic smoke high into the humid air above.

Up and up, around and around the great tower temple, Nelson was dragged, while the vast city of Jezreel, palaces, towers, courts, dwellings and all, lay

like a great panorama below. Up and up, and the wind grew stronger while Nelson marvelled at the great height of the structure he was mounting. Immediately in front of him swayed the naked shoulders of the three captive Atlanteans; he could see rose petals from their crowns fluttering in the strong warm breeze sweeping that man-made pinnacle for the worship of a heathen god.

Despairingly, the American's eyes searched the horizon, to discover nothing but a few great birds wheeling lazily in the bronze-hued sky. Very clearly he could discern three of the flame suns, casting flame high from their peaks.

"Alden!" he groaned. "Oh God, Alden, don't fail me!"

Chilled by the fate in store, he scanned the dark and hostile faces below, but found no friendly visage.

Up and up. The procession was now nearing the summit.

There were hosts of poignant problems before him,

each vital if Altara and the Empire of Atlans were to be saved; but one primary question immediately confronted him. How could he get his hands free? He ventured a few words in English to the stolid Atlantean at his side, whereat the fellow only stared dully and shook his red, flower-crowned head.

He next tried to cautiously work loose his hands, but to no avail. The rope of plaited skin binding his aching wrists together was tough as any rawhide. Cursing, he abandoned the effort, and, as his eyes once more swept the great bloodthirsty throng below, he felt himself doomed indeed.

Chapter 11

Standing at last on the summit of the great Ziggurat, Nelson found himself staring up at the fearsome golden image of the dread demon Beelzebub. The god stood some twelve feet in height and had a hideous human face, but, in place of hair and beard, countless golden tubes writhed in all directions. From the end of one, the puzzled prisoner beheld several tiny feathers of steam creeping forth, indicating that these hairs were a species of steam vent.

When, with the other captives, he was made to halt near its base, he further discovered that the idol sat upon a throne of yellow marble, the sides of which were carved with Sanskrit characters, necessarily quite meaningless to the doomed aviator.

In a grim and silent rank before Beelzebub's feet, stood some six or eight priest-executioners bending their black-robed bodies against the strong wind which swept that ghastly pinnacle.

Just below the base of the image, Nelson noted

several great, copper coils, no doubt conducting steam from the interior of the Ziggurat. Between the knees of Beelzebub rested a huge, shallow bowl, the use of which puzzled the American not a little, for he saw that the base of this ornate receptacle was also wrapped with a number of steam coils. Two great hands, ending in cruel-looking claws, were stretched horizontally above the demon's knees, seeming to plead for victims.

Suddenly a deep toned brazen gong sounded somewhere below; the trumpeters blew an ear-piercing note; and, at a gesture from the high priest, four of the brawny executioner-priests leaped forward, seized one of the Atlantean victims, hurled him to the stone platform and, in an unbelievably short interval, strapped the shrieking wretch by wrists, elbows, knees and ankles to a long, brass rod. Slung like a dead deer from a rail, they lifted the helpless Atlantean, and, while five hundred thousand voices roared in acclaim the priests fitted the pole ends into notches above the hands of the idol with the effect that the idol actually seemed to be clutching its victim.

Then, from all the pipes composing the hair and beard of Beelzebub, sprang forth hissing spouts of snowy steam which, whipped by the rising wind, went whirling madly down the lee of the Ziggurat. At the same time, from the half open mouth of the demon issued a fearful, screaming howl, a thousand times louder than the whistle of a speeding locomotive. Deafening and barbaric, it was reechoed from a hundred towers and battlements.

A dreadful, exultant yell burst from the multitude below as the red-robed priest drew from beneath his garments a sickle-shaped knife that glittered evilly in the light of the flaming suns. Still chanting, he stooped and quickly made a deep incision over the heart of the victim. While a piercing, agonized shriek burst from the ashen lips of the doomed Atlantean, his bright life-blood began to splash into the golden bowl below where, due to the presence of the steam coils, it swiftly commenced to hiss and bubble. Very quickly the last scarlet drops had fallen.

Then while Nelson, sick and horrified, stood watching, the dead body on its pole was taken down,

unstrapped, and hurled, limp and red-spattered, to the next lower platform where other priests waited to dismember it for the ceremonial cannibalism soon to follow.

In rapid succession two more victims were slaughtered amid the blood-hungry cheers of the Jarmuthian populace. Now the great bowl hissed and bubbled with a generous supply of the dark red fluid, from which rose clouds of evil-smelling steam that fanned the hideous features above.

From below suddenly arose an excited shout far mightier than any which had preceded it, when the executioners, sweating from their exertions, now turned and, spying Nelson, hurried forward. Coincidentally, the American's bound hands disappeared beneath the chiton. Squaring his shoulders, he gripped the pistol, prepared to make a good end.

"They'll get me, but before I die I'll send at least two or three of these devils to hell," he thought. "Come on —"

But, for an inexplicable reason, the arch-priest beckoned back his satellites, while roar upon roar of terrific excitement swelled from the swarming mob below, and a shout which at last became distinguishable bid fair to split the heavens. "Altara! Altara! Altara!"

Slowly, the temporarily reprieved victim's muscles stiffened. He understood. The next victim was to be the fair Altara, sister of Altorius and Sacred Virgin of Atlans.

"Altara! Altara!" A rising hurricane of impassioned human voices thundered the name.

Suddenly, the desire to live burned doubly strong in the American's breast. He must somehow prevent this inhuman catastrophe. But how? How?

Stealing a quick glance over his shoulder, Nelson stifled a groan. The southern horizon remained clear, and put an end to hope. No help! He must fight it out to the end alone.

A rank of exultant, black-bearded priests now appeared at the head of the stairway, then a quartet of olive skinned, semi-naked priestesses joyfully clashing brass cymbals.

There came an interval—and Nelson's heart stood still as there appeared the lovely head and shoulders of her whom he had first seen in the heart of the revolving crystal. Even more fiercely, mad revolt at fate gripped him.

Through hot, strained eyes the American saw that the stately Altara was beautiful beyond all possible comparison, and that she seemed utterly unafraid in the hour of her dreadful death. The Atlantean maiden's large, clear blue eyes were fixed with calm resignation on the distant flame sun of Jilboa. On her curling golden hair had been set a circlet of ceremonial yellow roses, while her white, slender body was thinly covered with a scanty robe of yellow silk.

Slowly, and moving her small bare feet in a regal stride, Altara climbed the last few steps and stood

straight and unafraid before the hideous demon god of Jarmuth.

Thousands of frantic inner voices assailed the aviator's consciousness. "Save her! You must save her! She's too young, too beautiful to die!"

Like a vast maelstrom of sound, so swelled the lustful cry of the dark multitude at the base of the Ziggurat, while the arch-priest chanted his litany in a sort of triumphant exultation. Then, all at once, one of the executioners roughly tripped the golden haired girl, sprawling her helpless on the bloody stones; and, before Nelson could quite realize it, the slender, silver hued form lay limp and helpless between Beelzebub's bloody claws.

Like a dynamo furiously gathering speed, so buzzed Nelson's brain. He was going to save her—if only for a brief interval! One man against a nation. Through a raging mist of fury he saw the red-robed priest raise his lean arms; then the American's bound hands darted beneath the blue chiton to reappear immediately. No one saw the pistol, for every eye was

rivettted upon the gleaming, sickle-knife of the red priest. Like a voice from hell, that eery scream burst again from Beelzebub's throat as his priest stepped near, the knife raised.

Amid a deafening roar the sickle-knife flashed higher; but it never fell, for the red priest suddenly reeled, clutched his chest and, staring wildly, staggered sidewise, while the assembled priests stared thunderstruck. The deafening roar of Beelzebub, the clamor of horns and cymbals had drowned out the report. In superstitious awe the Jarmuthians leaped back, panic-stricken, from the convulsively writhing body of the red priest, which rolled crazily down the steps before the idol; but a high shout of terror rang out as he toppled off the summit and, like a discarded puppet, plunged down the precipitous side of the cone-like tower.

Again Nelson's pistol spat, and two of the executioners collapsed in kicking agony. Like an avenging fury, the American raged about the summit, the pistol in his bound bands dealing death right and left until panic seized the remaining priests, who,

with one accord, abandoned their weapons to rush headlong down the dizzy, winding roadway. In a trice, none but Altara, Nelson, the two Atlanteans and the fallen priests remained on the summit.

It was the work of a moment for the Atlanteans to cast loose Nelson's bound wrists, and he theirs; time was precious, for, from below, a furious cohort of spearmen were charging up the stairs, their dark features terrible in their wrath.

"Only four more shots!" The sickening realization dashed into Nelson's brain. "That'll never stop them." Then in the midst of his despair he saw an answer. Stepping back he fired twice full into the great steam coil circling the base of the idol.

Spang! Spang! His bullets smacked through the copper coil to puncture neat, round holes. As he fervently hoped, jets of live steam rushed through these vents with terrible force and bathed the head of the stairs with a scalding, blinding vapor. Howling like mad beasts, the agonized Jarmuthian hoplites fell back, while overhead Beelzebub bellowed incessantly,

shaking the sky with his hideous voice.

"That's better." But Nelson knew his triumph to be brief. "*Where in hell is Alden?*" he raged as with shaking hands he released the bewildered girl from the death bar after the two Atlanteans had lifted it and its fair burden from the claws of Beelzebub.

Picking up the swords and other weapons of the fallen priests the two Atlanteans uttered their deep-toned war cry of *Halor vàn!* and joyously prepared to die fighting, as furious roar on roar of wrath arose from the populace, infuriated at being cheated of their prey. But the black-armored temple guards dared not charge those twin steam jets barring their approach. Accordingly they tried other means.

Nelson's heart stopped as a small, dark object sailed up from below and clattered on the platform. It was a grenade. With the speed of thought, the American kicked it to the landing below, where it exploded, annihilating a detachment of Jarmuthians by drenching them with the terrible fungus gas. Heart bounding with savage joy, Nelson watched the deadly

green fog leap from the broken grenade and of its own accord settle on the nearest soldiers. With the usual astonishing speed there formed on the stricken soldiery that poisonous yellow mould, whose fungus-like shoots sprouted through nostrils and mouths. On the dense crowd below the bomb's effect was appalling, and no more grenades were hurled....

During the respite Nelson's anguished eyes once more swept the skies. He started. Was it true or was it a mirage? Far to the southward a small, black speck materialized in the orange-hued heavens. Good old Alden! Hope wavered in the American's breast. Could he and his two fellows beat off the infuriated Jarmuthians long enough? He doubted it.

A shower of spears sailed up, but because of the angle, their trajectory was too great, and like rays of death the lances flashed harmlessly overhead to plunge over the summit and wreak death among those on the other side.

Nearer and nearer came the black speck while from the populace a low shout of amazement arose.

Coincidentally Nelson's heart stopped; aghast, he saw that the steam was no longer hissing from the holes at the idol's feet! Evidently, the steam current had been shut off from below to allow the raging priests to lead their followers in a desperate charge up the stairs.

Marshalling an Atlantean to either side, Nelson sprang to the head of the stair and fired full in the face of gorgeously robed priests who staggered back screaming. But the others wavered only an instant.

"*Halor vàn!*" Both Atlanteans hurled spears retrieved from the abandoned weapons—and each struck down his man.

The American's eye flickered up. Yes, there came a strange, but welcome sight: a great creature with enormous, leathery pinions was circling down towards the tower top! A clashing of weapons brought Nelson's eyes earthwards. He joined in a furious *melée* at the stair top, like the Atlanteans, using a captured bronze sword. There came a deep groan as the right-hand Atlantean collapsed with a bloodied bronze spear point standing far out from between his

naked shoulder blades.

A swooping shadow fell across the slowly advancing attackers. Beholding that awesome creature the Jarmuthians cowered, hesitated; then in headlong panic they darted below, uttering howls of fear and pursued by the surviving Atlantean, who, gone berserk, must have shortly paid for his folly.

The pteranodon was now quite recognizable, and seated on a double saddle was Alden, skillfully guiding the ungainly monster by means of a curious bridle, by shifting his weight and by pressing certain nerve centers between the great reptile's leathery shoulders.

Down, down circled Alden until the great wings skimmed just above Beelzebub's ugly golden head.

Her courage strained beyond endurance, Altara screamed shrilly in fear as Alden guided the huge reptile to the summit and forced it to light.

"Quick!" shouted Alden. "They're coming back up!"

"All right!" Catching up the fainting girl, Nelson hurdled two or three fallen bodies, and, while Alden showered fungus bombs upon the returning Jarmuthians, he laid his precious burden across the saddle and secured her with straps specially designed for the purpose.

"All right, Dick," he snapped. "Get going!"

"But you?" Alden's brown face was terribly intent.

"I'm not going! This creature could never carry the three of us. It can't, I tell you! Hurry, those devils are coming!"

Alden folded his arms. "If you don't go, I don't."

"All right then," snarled Nelson, vaulting into the saddle after casting loose the inert, yellow-robed girl. "Be a damned fool! We'll all die now."

It was a near thing, for the pteranodon, scenting the fresh blood, was very loath to obey its master, and scuffed awkwardly around the tower top two or three

times, while Nelson, clutching Altara to him, expended his last shot in driving back the enemy.

At last, the pteranodon spread its huge brown pinions and took off. Then Nelson gasped in alarm, for, unaccustomed to the heavy weight it now bore, the pteranodon scaled earthwards with the speed of a meteor, wildly flapping its bat-like-wings. Down! Down! Nelson had an impression of people scattering like frightened ants.

Alden cursed, tugged furiously on the bridle, and set his weight back in the saddle, but to no avail. Down! Ever down! The pteranodon now struggled among the tall buildings.

A sickening sense of defeat gripped Nelson as a long jet of steam shot out from a huge brass retortii mounted on the roof of an arsenal. The scalding fingers of steam just missed its target, but fortunately served to sting the descending pteranodon. With a convulsive shudder and a whistling scream, the hideous reptile commenced to flap its gigantic wings faster, and, slowly but surely, began to rise over the

yellow temples and towers of the barbarous city of Jezreel.

What followed is now a matter of Atlantean history. On its pages is set forth in full detail how the giant pteranodon barely crossed the boiling river to sink exhausted in the outskirts of Tricca.

There, also, is described the series of tremendous battles in which the Atlanteans, led by Altorius and inspired by the return of their Sacred Virgin, employed the terrible fungus gas to overwhelm the Jarmuthian invaders, driving them back with great slaughter to the steaming plains of their own land.

At even greater length is described the great triumph Altorius accorded the victorious aviators on the occasion of Victor Nelson's marriage to Altara.

"Doth it not seem strange," she whispered as they stood looking out over the great, sleeping city of Heliopolis, "that thou of the New World and I of the Lost World, should stand man and wife?"

The American's tanned face softened. "My darling," he whispered, "there are lots of strange things in the new Atlantis—but this isn't one of them."

March 1931

73 When the Mountain Came to Miramar by Charles Willard Diffin

- - -

The first tremor that set the timbers of the house to creaking brought Garry Connell out of his bunk and into the middle of the floor. Then the floor heaved and 'dobe walls swayed while the man fought to keep his footing and pull himself through the doorway to the safety of the dark night. The earthquake that came with the spring of 1932 was on.

It is magic against magic as Garry Connell bluffs for his life with a prehistoric savage in the heart of Sentinel Mountain.

He was nauseated with that deathly sickness that only an earthquake gives, and he dropped breathlessly in the shelter of a date palm while the earth beneath him rolled and groaned in agony. A deeper roar was rising above all other sounds, and Connell looked up at the nearby top of Sentinel Mountain.

The stars of the desert land showed clear; the grim blackness of Sentinel's lone peak rose abruptly from the sand of the desert floor in darker silhouette against the velvet of a midnight sky. And the mountain was roaring.

Softened by the distance, the deep, grumbling bass sang thunderingly through and above the other noises of the night, as if old Sentinel itself were voicing its remonstrance against this disturbance of its age-long rest.

The grumbling died to a clatter of falling boulders a hundred yards away at the mountain's base, and Connell's eyes discerned a puff of vaporous gray, a cloud of wind-blown dust, high up on the mountain's flank.

"Holy cats!" said Garry explosively, "what a slide! That must have ripped the old boy wide open."

His eyes followed the white scar far up on the mountainside, followed it down to the last loosened stones that had crashed among the date palms of Miramar ranch. "I don't just like the idea of the whole mountain moving in on me," he told himself; "I'll have to go up and look at that to-morrow."

It was afternoon of the following day when Garry rolled blankets and food into a snug pack and prepared for the ascent. "Guess likely I'll sleep out to-night," he mused and looked at the pistol he held in his hand.

"I don't want that thing slapping against me," he argued; "too darned hot! And there's nothing to use a gun on up on Sentinel.... Oh, well!" He threw the holster upon his bunk and dropped the automatic into the pack he was rolling. "I'll take it along. Might meet up with a rattler."

He brushed the sandy hair from his wet forehead and

straightened to his full six feet of slender height before he slipped the straps of his pack about his shoulders. And a broad grin made pleasant lines about his gray eyes as he realized the boyish curiosity that was driving him to a stiff climb in the heat of the day.

There was no real trail up the thousand-foot slope of Sentinel Mountain. Prospectors had been over it, doubtless, in earlier days, but in all of Garry's twenty-one years no one besides himself had ever made the ascent.

There was nothing in all that solitary, desolate peak to call them; nothing, for that matter, to beckon Garry, except the hot desert days, the cool breath of evening and the glory of nights when the stars hung low over all the miles of sand and sagebrush that reached far out to the rippling sand-dunes shimmering in the distance. Nothing, that is, but the "feel" of the desert—and young Garry Connell was desert-born and bred.

He stopped once and dropped his pack while he mopped his wet face. From this point he could see his

own ranch spread below him. Miramar, he had named it—"Beautiful Sea." The name was half an affectionate mockery of this land where the nearest water was fifty miles away, and half because of the sea of blue that he looked at now. Garry had never ceased to wonder at the mirage.

It was always the same in the summer heat—a phantom ocean of water. Garry's eyes loved to follow the quivering blue expanse that seemed so cool and deep. It rippled softly away to end in a line of white, like distant breakers on the horizon's rolling dunes.

This had been the bed of an ocean in some distant past, and that ancient ocean could never have seemed more real than this; yet Garry knew that this sea would vanish with the setting sun. He had watched it often.

A hundred yards farther and he stopped again. It was no well-trodden path that Garry followed, but he knew his landmarks. There was the big split rock a half mile ahead, and the three-branched cactus beside it. But between these and the place where Garry stood was a

fan-shaped sweep of boulders—and this where smooth going had been before.

He forgot for the moment all discomfort. He stood staring under the hot sun that cast purple shadows beside the weathered rocks, and his eyes followed up the scarred mountainside.

"That whole ledge that stood out up there—that's gone!" he told himself. "The whole side of the mountain just shook itself loose...."

Far above, his eyes found another towering mass that reared itself menacingly. "That will come down next time," he said with conviction, "and I don't want to be under it when it breaks loose." Then his searching eyes found the lower ledge and its shattered remains.

It had held a welter of rocks above it as a dam holds the pressure of water—and the dam had burst. The torrent of stone from above had swept into motion and carried with it the accumulation of loose rubble below. Where the ledge had been was now a cliff—a sheer wall of rock. It had been covered before by the

talus that was swept away.

Garry's eyes narrowed to see more plainly under the sun's glare. He was staring not alone at the cliff but at a shadow within it—a black shadow in the white face of the cliff itself.

"That was all covered up before," Garry stated; "buried for thousands of years, I suppose. But it can't be a cave; not a natural one, at least. There are no caves in this rock."

He stopped at times for breath, and his wonder grew as he climbed and the black mark took clearer form. At last he stood panting before it, to stare deep into the utter blackness of a passageway beyond an entrance of carved stone.

It was carved; there was no mistaking it! Here was a passage that nature had never formed. He took a quick stride forward to see the tool marks that showed on hard walls where symbols and figures of strange design were carved. An intrusion of harder rock had formed a roof, and they had cut in below—

"They!" He spoke the word aloud. Who were "they?"

He remembered the scientist who had stopped at the ranch some time before, and he recalled enough of the talk of Aztec and Toltec and Mayas to know that none of these old civilizations could explain the things he saw.

"This goes way back beyond them—it must," he reasoned. And there were pictures, long forgotten, that came to his mind to show him a vision from the past—figures whose coppery faces shone dark above their brilliant, colored robes—slaves, toiling and sweating to drive this tunnel into solid rock. He was suddenly a-quiver with a feeling of the presence of living things. His breath seemed stifled within him as he stepped into the dark where a pencil of light from his pocket-flash made the blackness more intense.

He tried to shake off the feeling, but an indefinable oppression was heavy upon him; the weight of the uncounted centuries these walls had seen filled him with strange forebodings.

His feet stumbled and scuffed over chips of stone; he steadied himself against the wall at times as he followed the corridor that went down and still down before him. It turned and twisted, then leveled off at last, and Garry Connell drew himself up sharply with a quick-drawn breath.

His flash was making a circle of light a dozen steps ahead, and showed a litter of sharp stone fragments. And, scattered over them, a tangle of bones shone white; one skull stood upright to stare mockingly from hollow sockets. The sudden white of them was startling in the black pit.

"Bones!" he said, and forced himself to disregard the echoes that tried to shout him down; "just bones! And the old-timers that wore them haven't been using them for thousands of years." He moved forward with determined steps to the end of the passage that finished in solid stone. He stopped abruptly. At closer range was something that froze him to a tense, waiting crouch.

This wall of solid stone—it was not solid as it had

seemed. There was a doorway; the stone was swung inward; and at one side in a straight-marked crack, he saw a thread of light.

He snapped off his own flash. Someone was there! Someone had beaten him to it! He held himself crouched and rigid at the thought. But who could it be? The utter silence and the steady, unchanging, pale-green light showed him the folly of the thought. There was no one there; there couldn't be anyone.

His hand, that trembled with excitement, reached across and over the skeleton remains posted like a ghostly guard before the door. He threw his weight upon the stone.

Its bearings groaned, but it moved at his touch. The stone swung slowly and ponderously into a silent room, and Garry Connell stared wide-eyed and wondering where rock walls, in carved and colored brilliance reflected the softest of diffused light.

A great room, hewn from the solid rock!—and Garry tried to see it and all that it held at one glance. He

grasped the extent of the stone vault, a hundred feet across; the distant walls were plain in the soft light.

One high point of flashing color caught his eye and held it in marveling amazement. A thing of beauty and grace. It was a shining, silvery shape like a mushroom growth; it towered high in air, almost to the ceiling, a slender rod that swelled and opened to a curved and gleaming head. Graceful as a fairy parasol, huge enough to shelter a giant, it was like nothing he had ever seen.

But there was no time now for conjectures. He made no effort to understand; he wanted only to see what might be here; and his eyes flashed quickly over sculptured walls and a stone floor where metal boxes were arranged in orderly rows.

Hundreds of them, he estimated; huge cases, some eight or ten feet long. Two nearby were raised above the floor on bases of carved stone. Lusterless gray in color—metal, unmistakably—and in them....

"No use getting all hopped up over treasure hunting,"

Garry had told himself. But under all his incredulous amazement had been flickering thoughts of what he might find.

He stared hungrily at those two boxes near him. Each of the hundreds was big enough to hold a fortune. He reached for a metal bar beside the scattered bones, and, like a man in a sleep-walking dream, he stepped across those relics of earlier men and entered the room that they had guarded.

The light stopped him for a moment. He puzzled over it; stared wonderingly at a circle of glowing radiance in the roof of stone. It reminded him of something ... the watch on his wrist ... yes, that was the answer—some radio-active substance. His eyes came back to the nearest chest, and he jammed the point of his corroded bar beneath the flange of a tight-fitting lid.

The hidden room was cool, but Garry Connell wiped the sweat from his eyes when he ceased his frantic efforts. The metal bar clanged loudly upon the floor beside him. He stood, breathing heavily, his eyes on the metal cover that refused to move. And in the

silence there came to him again that strange, prickling apprehension. He caught himself looking quickly behind him as if to find another person there.

His eyes were accustomed now to the pale light, and the sculptured figures on the walls stood out with startling distinctness. Garry turned to look at the nearer wall and the figure that was repeated over and over again.

It was a man, tall and lean, his robes, undimmed by the years, blazed in crimson and gold. But the face above! Garry shivered in spite of himself at the devilish ugliness the artist had copied. It was dead black in color, with slitted eyes that had been touched up artfully to bring out their venomous stare. The head itself rose up to a rounded point that added to the inhuman brutality of the face.

He was seated on a throne, Garry saw, and other figures, less skilfully carved, were kneeling before him. Again, he was standing above a prostrate enemy, a triple-pointed spear raised to deliver the final blow.

Silently, Garry let his eyes follow around the room with its repetition of the horrible being who was evidently a king. Then he whistled softly. "Nice kind of hombre, he must have been," he said. And, "Boy," he told the carved image familiarly, "whoever you were, you've been dead a long time, and I don't mind telling you I'm glad of it."

He was slowly circling the first casket. Beyond it was the slender rod with its mushroom head that seemed more like a bell as he looked from below. The head's inner surface was emblazoned, like the figures on the wall, with crimson and gold in strange designs. He saw now that the base of it was connected with a smaller box, placed like the two beside it on a stone pedestal.

He came slowly beside it to study the box with narrowed eyes. He expected the metal cover would be as immovable as the others, and he started back and caught his breath sharply as the metal raised at his touch and the green radiance from above flashed back from within the box in a thousand scintillant lights. Then he stooped to see the brilliant, silvery

sheen of metal wheels that moved on jeweled bearings.

A mechanism of some sort—but what? he wondered. He had some knowledge of the stream of electrons that discharged continuously from the light above, and he knew how they could charge an electroscope that would automatically discharge to produce motion. He nodded in half-understanding as the fluttering gold-leaf fell and allowed a tiny wheel to move one notch in its escapement.

"Clockworks!" he told himself—it was as near as he could come to a name for the machine—"and it's been running here all this time.... What for, I wonder? What was it supposed to do?"

He stared again at the bell-shape towering above him, but its purpose was beyond guessing: it was a part of the machine. His eyes came back to the mechanism itself. There was a splinter of stone.... Garry reached for it unthinkingly, but his hand was checked in mid-air.

The fragment was wedged beneath a tiny lever, holding it erect. "That's the answer," Garry whispered. "The machine was left open,"—he felt of the cover that had been dented by some heavy blow, and saw sharp splinters of rock beneath his feet—"a rock fell from the roof, flaked off and dropped onto the machine, and a splinter jammed this little lever. But the machine has been ticking along...."

His fingers reached for the stone.

"Let's go!" he said, and grinned broadly at the thoughts that were in his mind. "Let's see what the machine would have done!"

The fragment came away within his hand, and he saw the lever fall slowly. There was motion within the case—wheels and shining spheres that touched one upon another were spinning in gleaming circles of silvery green—and from above he heard the first faint whisper of a sound.

It came from the bell, and Garry drew back to stare upward. The first soft humming of the clear bell-note

was incredibly sweet. It rose in pitch while the volume increased, till the musical note was lost in the rising roar that resounded from walls and roof. Higher it rose; it was a scream that was human in its agony, prodigious in its volume!

Garry Connell stood trembling with unnamed fear. This sound was unbearable; it beat upon his ears; it battered his whole body; it searched out every quivering nerve and tore at it with fingers of fire. Still higher!—and the scream was piercing and torturing his brain. He felt the jerk of uncontrollable muscles.

The whirling machine was a blur of light, and he longed with every fibre of his tortured mind to throw himself upon it—into it!—anything to end the unbearable impact from on high. His body, assailed by a clamor that was physical torment, could not move; the vibrations beat him down with crushing force, while the shrieking voice rose higher, then grew faint, and, with a final whisper, died to nothingness.

And still Garry felt himself sinking; the room was blurred; the excruciating agony of tortured nerves

melted into a lethargy that swept through him. Dimly he sensed that the monstrous, quivering, bell-topped thing was still launching its devastating rain of vibrations; they were above the range of hearing; but he felt his body quivering in response to the unheard note. Then even these vague fragments of understanding left him. The towering, soundless thing was indistinct ... it vanished in the darkness that closed about....

He was upon the floor in a crouching heap when the tremors that shook him ceased. His mind, in the same instant, was cleared, and he knew that the soundless vibrations from the bell had ended. A wave of thankfulness flooded through him, and he luxuriated in the utter silence of the room—until that silence was broken by another sound.

It was hard and metallic, like the click of a withdrawn bolt, and came first from the case at his side. A second sharp rap replied from the other raised casket, then an echoing tattoo of metallic impacts rattled and clattered in the resounding room. Each of the hundreds of caskets was adding its voice to the

clacking chorus.

The paralysis that had held Garry's muscles was gone, and he came slowly to his feet to see the edge of the cover he had tried vainly to move, rising smoothly in the air. His eyes darted about; the second casket was opening; beyond were countless others; the room was alive with silent motion where metal lids lifted like petals of flowers unfolding to the sun.

The machine had done it! The conviction came to him abruptly. Those vibrations that had beaten him down had done this: some unlocking mechanism within each case had been actuated when the vibrations reached the proper pitch. Then the thoughts were driven from his mind by a more thrilling conviction: The caskets were open! The treasure! Who could know what some of them might contain? He took one quick step toward the nearer of the two.

One step!—and his reaching hands stopped motionless above the open case. The contents of the box were plain before him—and he stared in horror at the black, half-naked figure of a man as silent and

unmoving as its counterpart upon the wall.

Black as a carving in ebony, it was the face that held Garry's eyes. He saw the pointed head, the thin lips half-drawn from snarling teeth, the expression of brutal savagery that even this frozen stillness could not conceal.

The eyes were closed; Garry saw their slitted lids. He was looking at them when they quivered and twitched. The lids opened slowly, drew back from staring eyes that were cold and dead—eyes that came suddenly to life, that turned and stared unwinkingly, horribly, into his.

Garry's lips were moving as he drew back in slow retreat, but he heard no sound of his own voice, only a husky whisper that said over and over again: "Mummies! Caskets of mummies! And they're coming back to life!"

Suspended animation. He had heard of such things. Dim, fleeting remembrance of what he had read came flashingly to him—toads that had lived a thousand

years sealed up in rock—but this, a human thing, a man!—no, no!—it couldn't come to life; not after all this time!

The pointed head, the ugly, menacing face and the body of dead black that rose slowly within the casket gave his argument the lie. In dreadful, living reality he saw the thing before him as it stretched its corded neck, extended and flexed its long, black arms and breathed deeply through lips drawn thin. Then, with a bound of returning energy, it leaped out and down to stand half-naked and black, towering threateningly above his head.

And Garry, too stunned to feel a sense of fear, looked first at the living face before him and then at the carvings done in stone. There was too much here for instant comprehension; his reason could not follow fast enough where facts were leading, and his mind seemed groping for some certain, proven thing.

"It's the same one that's on the wall," he explained painstakingly to himself. "It's the king, the old boy himself! I said he would be a bad hombre; I said he

was a bad one—"

He saw the other raise his hands threateningly, and he crouched to meet the attack. But the black hands dropped, and the scowling face turned, while Garry's eyes followed toward a sound of movement in the second casket.

The green light flooded down, and Garry Connell glanced quickly at the doorway. Too many of these blacks and this would be no safe place for him. He was expecting another apparition like the first; he would have thought himself prepared against any further surprise, but his gray eyes opened wide at what the light disclosed.

There was the casket, gray and lusterless on its low, stone base. Its cover, like the others, stood erect, and above the nearer edge an arm was raising. But it was a white arm, and it ended in a slim, white hand!—its rounded softness held in clear outline against the back ground of gray, until the arm fell that the hand might grip the metal edge.

Garry's eyes held in wondering fascination upon those slender white fingers. The hand of a woman—a girl!—what marvel of miracles was this? He held his silent pose while he stared at the face that appeared before him.

It was milk-white against the dull gray metal beyond, the white of death itself, until returning circulation brought a flush of pink that crept slowly to the rounded cheeks. Dark hair cascaded about the shoulders to mingle with a lacy veil of golden threads. A film of golden lace wrapped about her—her robes had gone to dust, vanished with the vanished years—and only the threads of gold with which the robe was shot remained, a futile concealment for the slim white of her shoulders, the soft curves of rounded breasts. But Garry's eyes were held by the eyes that looked and locked with his.

Dark eyes, deep and steady, yet glowing softly with the wonder of this awakening. Windows, crystal clear, through which shone softly a light that filled him through and through!

Alluring as was the rounded whiteness of the form so thinly veiled, it was not this nor the childlike beauty of the face that held him spellbound. Garry Connell's only love had been the desert, and now he was filled and shaken by the glamour from within these thrilling eyes.

A rasping word made echoes in the silence, and Garry saw the girl's eyes widen as she turned them upon the black one, who had spoken. He saw her face lose its color and go dead white, and plainly her wide eyes showed the fears that swept in upon her with returning remembrance.

Garry followed her gaze to the wild figure whose slitted eyes glittered in savage triumph and possessiveness at the white beauty of the trembling girl. The lean figure spoke again in that rasping, unintelligible voice—he addressed the girl now—and the tone sent a strange prickling of animosity through every fibre of the watching man.

The black one took one stride forward; the girl, in a flash of white and gold, sprang from her resting place

to take shelter behind the high casket. Her eyes came back to Garry's, and the call for help though voiceless was none the less real.

Then her pale lips moved, and she called to him with a clear voice that uttered unknown words.

Garry came from the spell that bound him, and with a quick rush made between her and the advancing man. He landed tense and crouching, and his voice was hoarse with excitement when he spoke.

"That'll be all from you," he told the black one.

His words could mean nothing to this savage, but the tone that rang through them, and his crouching, ready pose, must have been plain. The inky face beneath the high-pointed dome of head was twisted with rage; the eyes glared at this being who dared to oppose him. But the black one paused, then stepped backward to the casket where he had been.

Garry retreated a few slow steps to the end of the metal box that sheltered the girl. "Can't you understand me?" he asked. "Am I dreaming? What has happened? Who are you, and who is this black beast? What does it all mean?"

Again he was sure that mere speech useless, but he felt that he had to speak, to say something, anything, to prove the reality of his own waking self and of the wild, nightmare experience.

He saw the crouching girl rise to her full height; he saw the movement of her hand as she swept the dark hair away from her face, and the film of gold lace clung closely about her as she came to his side. One hand was outstretched to rest, light and cool, upon

his forehead.

He heard her voice, so soft and liquid yet so charged with terror. She spoke meaningless words and phrases, but at the touch of her hand upon his face he started abruptly.

Did the words themselves take on meaning and coherence, or was it something within himself?—Garry could not have told. But, with the startling clarity of a radio switched full on, he got the impress of her thoughts, and his own brain took them and put them into words that he knew.

"You will help me, you will save me," the words were saying. "You are one of us, I know. You are a stranger, but your skin is white; you are not of the tribe of Horab."

Garry was motionless and listening. He knew he was sensing her thoughts—she was communicating with him by some telepathic magic—and he knew, as he caught the words, that Horab was the black one there before him, reaching and feeling within the casket

where he had slept. Horab—a savage king of a savage land—

"He captured me," the words continued in breathless haste. "I am from Zahn: do you know the good land of Zahn? I am Luhra. Horab captured me; carried me here to this island; it was yesterday he brought me here. He put me to sleep, and he put his men to sleep, hundreds of his chosen warriors. He worked his magic, and he said we would sleep for one hundred summers. But it was yesterday. And now you will save me; my father is a great man; he will reward you—"

The sentences flashed almost incoherently into his mind, but ceased at a sound and stirring from the room at their backs.

Garry needed a moment for the substance of the message to register. He had heard it as truly as if she had spoken: Horab had captured her—yesterday!... And his own lips that had been loose with astonishment closed to a grim smile.

"Yesterday!" She thought it was yesterday that her

long night had begun. Did Horab know the truth? Garry was suddenly certain that he did. Horab's plans had miscarried; he could not know how far in a distant past was that day when he had placed himself and this girl in their caskets, safe in their mountain tomb.

Only an instant for these thoughts to form—then his eyes were steady upon the tall savage who had found what he sought in the big metal case. Horab, king of a vanished race, turned now with a heavy scepter in his hand; and its jeweled head flashed brilliantly as he raised it high in air and shouted an echoing command into the room. A white hand was tugging at Garry's shoulder, a soft body clinging close, to turn him where new danger threatened.

The other caskets! He had forgotten them, and he saw the nearer ones alive with struggling forms. A black man-shape, with sullen, animal face and pointed head, came slowly erect and staggered upon the floor. Another—and another! There were scores of the black, naked men who scrambled from the nearer caskets and swayed drunkenly upon their feet.

Garry stood tense, his mind a chaos of half-formed plans. This one brute he might handle, but the whole tribe—that was too large an order. Yet he knew with an unshakable conviction that he would carry this girl from their evil clutches or die in the trying.

Feminine charms had failed to interest Garry in that world outside, but now the message of these soft eyes, the appealing beauty of this lovely face, proud and unafraid despite her fears, the hand so soft and trusting upon his face!—there had something entered into Garry Connell's lonely life that struck deep within him and found a ready response.

He swept one arm about the soft, yielding body beneath its wisp of garment, and he swung her behind him as he set himself to meet the attack. And he flashed her a look that must have carried a message, for the trembling lips were framing a ghost of a smile as her eyes met his.

Garry's thoughts darted to the gun, but his tightly-wrapped pack was in the passage outside. He prayed for a moment's time that he might meet this mob

pistol in hand, and he half turned; but no time was given. The leader was shouting orders, his harsh voice resounded in shattering echoes throughout the stone vault, and the horde of blacks surged forward at his command.

A mass of lean bodies, with faces ugly and brutal where sleep-filled eyes opened wide and glaring! They crowded upon him, and Garry met the rush with a rain of straight rights and lefts into the nearest faces. He was carried backward to the wall by the weight of their numbers, but he saw some go down for the count.

The room seemed filled with leaping, shouting men. Their shrill cries echoed in a tumult of discord, and above all Garry heard the hoarse screams of their leader.

There were fists and arms clubbing at his head. He warded them off, then sprang from the wall, leaping outward and sideways, where there was room for free swings of his pounding fists. Another black face went blank under the impact of his blow—a second—and a

third!

He was giving ground slowly as the others came on. Then beyond the crowding figures he saw one who held a trident spear high in air. The weapon was poised; the metal points shone in the green light—points that would tear his body to shreds at a single blow.

Garry paused but an instant, then opened his clenched fists to clutch the lean neck of an enemy before him. He whirled the man's body and held it as a shield while he reached vainly to grip at the thrusting spear. Dimly he saw the flash of white and gold where the girl, Luhra, threw her own body upon the armed figure and clung in desperation to the shaft of the deadly weapon.

Garry hung fast to the struggling body, that was his shield; there were other spears now that flashed in the air. He loosed one hand and landed a short jab in the face of a savage whose hands were at his throat. The blow was light, and he was amazed to see the man stagger and fall. There were others who swayed

helplessly and stumbled to their knees. Spears rang sharply, clattering upon the stone.... They were falling. The body he held went suddenly limp within his arms and sagged heavily to the floor....

Garry saw the one who had threatened him drop; he took the girl with him as he fell, and his spear flew wildly from his open hand. Garry was alone!—and the enemy was only a tangle of sprawling bodies where the twitching of an outflung arm marked the last sign of life.

He was breathing hard, for some of the enemies' blows had landed, and he staggered as he wiped a trickle of blood from his eyes. No time to figure what this meant, but the blacks were certainly out of it. Beyond the huddled bodies the tall figure of Horab leaped wildly in air as he sprang forward, and in the same instant Garry threw himself between the black menace and the prostrate girl.

He staggered again as he landed from his wild leap, and he called for his last reserve of strength to put power behind the blow that he launched for the

snarling face above.

The heavy scepter swung high, and was falling as Garry struck. He saw the blow start; saw the fiery arc the jeweled head made in descending like a mace above his head. Then the face of Horab vanished, and the room was a whirling place of flashing red and yellow before blackness blotted it out....

Garry awoke to blink stupidly at a green light above him. His head was a blinding, throbbing pain that blurred his thoughts.

It cleared slowly. The gleaming figure of a girl was rising from the floor. His aching eyes saw the white of her young body through the dull glow of golden lace. Her eyes came to his, and sharply he realized that this was no dream—this cave whose walls seemed swaying, the face that was staring pitifully at him, and, beyond, in a ghastly green light, the dark silhouette of a lean man who bent his pointed head above a chest.

Connell's mind was a whirl of snarled thoughts and

emotions, of puzzled wonder and fighting rage; yet strangely through and above them all was a feeling of pure joy in the message of the eyes in a face that was utterly lovely.

The black figure had opened the chest. Garry saw the luminous green about it shot through with the reflected radiance of many gems. Jewels cascaded brilliantly from the lean black hands as they withdrew a golden cord. Part of some gem-incrusted fabric, it was, that he tore roughly from its rotted fastenings before coming swiftly to the still helpless body of Connell.

Garry's struggles were futile; his hands were tied before him. The shooting pain of a prodding spear brought him from the paralyzing numbness that held him, and he came dizzily to his feet. Again the walls whirled, and he would have fallen headlong but for a lithe, soft body that sprang close to throw white arms about him.

Through blood-shot eyes he saw Luhra, of the land of Zahn, with head held high and flashing eyes as she

turned squarely to face the savage black. And he heard the stream of strange sentences that she poured protestingly upon him.

Her message broke off abruptly. Garry's eyes followed hers to watch a savage king, naked but for the tattered remnants of robes that time had eaten. He was reaching, into a casket that had once held kingly raiment—reaching with a lean black hand that brought forth only fragments of purple and crimson cloth that went quickly to dust within his hands.

Garry saw the slitted eyes stare in puzzled wonder at the rotted cloth, then glance sharply and inquiringly about. He saw the black one place a jeweled head-dress of barbaric splendor upon his ugly, pointed head, then rise and cross slowly to the heap of bodies. Spear in hand, he passed on to the serried rows of caskets.

Those nearest were empty, as Garry knew; he had seen the eruption of life from within them. Horab, with a growled word, moved on to the other caskets that stretched out across the room. The ugly head

stooped; again the hands reached down, to come back this time with an empty, gleaming skull.

Garry thought once of his pistol, but knew in the same thought that he could never reach it; the spear of Horab would crash through him at the first movement. He dismissed the thought—forgot it—and forgot all else in the fascination of beholding the sagging lips and the scowling stupefaction on the black face of Horab. And slowly there came to his throbbing brain an explanation.

One hundred summers, Luhra had said—Horab had meant to sleep for a hundred years—and the machine that was to waken him had failed to function. Ages beyond computing had passed, and these two only, the black king and the girl, had survived. They had been directly beneath the light; its flooding energy had brought them safely through the dreamless years. But, for the others, it had been different.

Those nearest the light had responded to the vibrating call, but their vitality was gone; their moment of life was short. As for the hundreds who

had felt the light but faintly—the skull told the story. They had died as they slept, died thousands of years ago, and their skeletons were all that remained to mock at their king and the frustration of his plans.

But what was the purpose of the long sleep? Luhra's touch and her soundless words supplied the answer.

"Why did he wish this?" her mind said, repeating his question. "Horab's own country was lost; the yellow-ones from across the great water had conquered and overrun it. But Horab had planted the seeds of disease, and the yellow ones must all die in time. Horab is a king and a worker of magic; he is in league with a devil; he learns his magic of him. We of Zahn, all feared the magic of Horab—" She stopped at the quiver of rock beneath their feet.

Garry's mind had cleared, but it was an instant before he knew that the movement was not in his own throbbing head. Then the earth tremor came unmistakably, and his thoughts flashed back to the mass of rock above the mouth of the cave. If more quakes were coming they must get out, and do it at

once—

The black hand of King Horab cast the skull vindictively against the wall, and the clatter of its falling fragments mingled with strange oaths from the savage lips. Then he came toward the two and Garry searched his mind desperately for some means of escape.

The trident spear was aimed, and Garry waited for the throw. He felt, more than saw, the flash of light that was Luhra as she sprang for a spear beside the fallen men. An instant and she was before him, tense and poised, a golden Amazon, whose upraised arm and steady eyes checked even Horab in his advance.

She spoke to the savage in sharp, staccato phrases, but Garry got no meaning from the words. There was a quick interchange between them; vehement protest and shaking of his poised spear on the part of Horab. Luhra added a word or two, and she lowered her weapon as Horab did the same.

Her head was bowed as she reached to touch Garry's

forehead. He sensed a hopeless sorrow that was so plainly hers, but with it he felt a mingling of another emotion that stirred him to the depths of his being. The slim, white figure straightened, and the dark eyes squarely upon his when she spoke.

"Listen carefully," she said; "it is the last time—"

Garry found himself trembling; he was suddenly breathless with emotion. The racking pain in his head had settled to a dull ache, but his brain was clear, and through it were flashing strange thoughts.

The threat, the wild adventure itself!—they were nothing before the truth that was so plain to him now. He loved this girl! he loved her!—and his whole self responded with an inflow of fresh energy at the thought. A stranger from a strange, lost world!—but what of it?—he loved her!... The message from the lips and fingers of the girl broke in upon the thoughts that were crying for expression.

"You think of me." She smiled with her lips and eyes. "I am glad that you do, my dear one, but it is

hopeless.

"Listen: I have promised; Luhra has spoken: I will go with Horab to do as he wills. I will go freely, and he will leave you here unharmed. He promises me this.

"I will go with Horab far across the blue water that surrounds us here. It is an island, as you know, for have you not come here from afar?" Garry broke in with a startled exclamation. An island! Water! He closed his lips upon the denial of her words.

"And you," Luhra continued unheeding, "when we have gone, will return to your own land.

"But, oh, my dear one, remember always I love you. I have read your thoughts, oh bravest and tenderest of men; I loved you from the moment when my eyes opened and found you waiting there. I am telling you now, for I will never see you again." She broke in upon the wild urge of protest that filled his mind.

With an imperious gesture she motioned Horab to discard his spear, and she placed hers beside it on the

rocky floor. But she flinched and retreated from the outstretched arms and grasping hands, while Garry Connell struggled in insane frenzy at the cords that bound his wrists.

He felt the lean hands of Horab upon him, and the long arms held him in a crushing grip. And he saw the black face laugh evilly at the watching girl as Horab kicked the spears over beside the casket where she had been.

Garry felt himself raised in air, and he was as helpless as a child in that grasp. An instant later he was thrown heavily, to lie bruised and breathless in the metal box where first he had seen Luhra's face in wide-eyed awakening.

The rasping voice of Horab rose high and shrill. He was shouting triumphantly at the girl, while his hands worked to bind Garry's feet. Luhra's head and shoulders showed above the casket edge as she circled swiftly to approach from the opposite side and reach a trembling hand that would make the contact necessary for thought transference. Her cool touch

was upon him; Garry ceased his futile struggle while her words came, brokenly to his mind.

"Horab has tricked us," she cried; "he is leaving you here. He will paralyze you with the devil song of the bell, but not to sleep as I did: it will stop on another note. He says you will be always awake, but helpless—thinking—thinking—always!"

She buried her face in her hands to hide from his gaze the horror that was in her eyes. Garry Connell's straining hands went limp. The terror in the girl's voice struck through his own wild medley of thoughts to make him shudder with realization of the truth.

The threat was real! If Horab left the cave and took Luhra with him, the two would die in the desert. The black savage would never dare to face the strange, new world. And he, Garry, would be here in this cave, in this very coffin, held in a waking death. No one knew he was here; only by chance would the cave be investigated. And when someone finally came!

Garry stared in fascination at the green light. He

knew with terrible certainty that whatever help might come would come too late. To lie there hour after hour, for days and then for years—waiting!—always waiting!... And he could never still his thoughts.... He had a sickening realization of the thing they would find. A body!—his body!—and the mind within it utterly insane....

The sound of the shrieking bell was in his ears, and his nerves were trembling in response. He saw long arms above the casket, tearing away the figure of a struggling girl.... And then he knew he was alone....

The sound of the bell rose to the piercing, nerve-shredding scream he had heard before. He must think fast—and act!—but the numbness of brain and muscle was creeping upon him. He tried to call out, but his throat was tight, and would not respond. The echoes died into silence; the vibrations, as before, passed beyond audible range. He was sinking ... sinking....

Dimly he felt the casket shaking beneath him. In some distant corner of his mind he knew that the earthquake shocks had turned. Then he heard with

ear-splitting plainness the shrieking discord as the tremor shook the vibrating machine to silence.

The room was quiet; the paralysis left him; and in the instant of his release the clear brain of Garry Connell flashed from chaos to lay before him a full-formed plan.

"Luhra!" he called in the silent room. "Luhra!" But it seemed an age before he heard Horab and his captive returning from the passage. Then the touch of her hand gave him courage to continue.

"Yes?" she whispered; "yes, my dear one?"

He saw the shoulders of the black as he half-raised a spear threateningly toward the girl, then turned to adjust the whirring machine.

"Tell him," shouted Garry, "—tell Horab to shut off that damnable machine!" The shriek of it was rising again to drown his voice. "Tell him his life depends upon it. Tell him to listen to what I say or he will die."

He heard the girl's voice raised in a high-pitched call, and he heard the rasping snarl of Horab in reply. The girl repeated her cry above the echoing clamor of the bell—and the intolerable, rising scream, after a time, was stilled.

Garry experienced one raging moment when he would have given his hope of life for the ability to talk to Horab face to face and in words that could penetrate the black one's brain. But he could not. He must use this girl as an interpreter, and he must give her words to say that would make this ugly beast pause. He must speak as she would speak; put words and sentences into her mouth that would reach the savage superstitions of the other.

He spoke slowly, and stared impressively into the dark, fear-filled eyes in the white face that bent above him. He must make the girl believe.

"Horab works magic," he told her. "Tell Horab that I, too, am a magician—a great magician—a greater one than Horab."

He waited an instant to hear the girl's words and the disdainful laughter from lips in a savage face thrust close to where he lay.

"Horab is truly a magician," said Luhra doubtfully; "he laughs at your magic. Horab's *Tao* is a strong *Tao*, wicked and powerful."

"His *Tao*?" said Garry, and looked at the girl questioningly. He got the thought in her mind. "Oh, yes—his god, or devil."

He turned his head to stare straight into the grinning face whose wide, thin lips were twisted into a leering snarl. Garry had to summon all his power of will to hold the look that he gave his enemy and to laugh, in his turn, long and contemptuously. Another tremor shook the casket where he lay.

"Tell Horab," he ordered, while his eyes stared steadily into those of the savage king, "—tell Horab my *Tao* is stronger than his. My *Tao* is angry because I have been harmed; he is shaking the mountain. He will shake it down on Horab and crush out his life."

He continued to stare while he heard Luhra's voice, high with hope, and he saw a change of expression flicker across the black face, though Horab shouted a vehement reply.

Luhra was speaking to him. "Horab says the earth has shaken before; that it is not your *Tao* who shakes it. He asks for another sign."

Garry was not surprised. He had fired this shot at random; the tremor itself had suggested it. And now—

"Another sign!" Garry had to fight hard for self-control to keep from shouting the truth to this evil thing—to keep from telling him of the time that had passed, and of the world that was waiting for him. But that would never do: he must play upon this black one's superstitions. Let Horab once leave this cave with that devilish, soundless scream ringing in his ears and he, Garry Connell, was lost. And Luhra!—what hope for her out there?... The black hands were moving impatiently toward the machine....

Garry found himself speaking slowly—short sentences

that Luhra quickly repeated. And something within him rose to frame words such as Garry Connell, man of the desert, would never have thought to speak—phrases that best might reach a savage, vicious mind.

He glanced once at the watch on his wrist. He did not feel the torture of the tight gold cord. He was thinking in terms of daylight, and of how much time had passed since he had seen the sun....

"Horab shall have a sign—a terrible sign," he said.

"Death waits for Horab in the world outside, my *Tao* tells me. Horab shall die horribly. I see him choking in the hot sand. His tongue fills his mouth. The hot sun burns, and he is filled with fire. He tries to scream—to call upon his *Tao*—but he makes no sound.... And so shall Horab die."

The girl translated swiftly; the answer was a wild cry of rage from the black. He sprang beside the helpless man and his spear was raised high.

Garry felt the weight of Luhra's body thrown protectingly across him, and looked up to see murder

in the savage, slitted eyes. "Tell Horab," he directed sharply, "that if he harms you or me the burning death is his! But—" He waited deliberately after Luhra had spoken, and he saw plainly the flicker of fear in the ugly face. Now was the time.

"Unbind my feet!" he ordered, and he put into his voice all the force and menace he could muster. "Take me to the outer world. Take your spear. If I do not speak truth, kill me there. My *Tao* will show you a sign; he will fill your heart with fear as it now is filled with evil. But, it may be I can save you. Unbind my feet! Be quick!"

Again he waited while Luhra spoke, and he cursed silently with the agony of waiting. To be playing a part, speaking these absurdly childish things, when what he wanted was his hand upon a gun or in a grip of death about that black throat! Yet he lay as still as if the vibrations of the bell were upon him, and his eyes held unwaveringly upon the savage face, until he felt the fumbling of hands about his feet....

A square-cut portal!—and beyond it a golden sun that

shone through mists of purple and rose! Was he too late? Garry pressed forward in what would have been a clumsy run, but for the spear that had prodded him through all the long passage, and that warned now against attempted escape.

The brilliance and heat that struck him when he stepped, out into the open brought Garry in a flash from the world of horror and make-believe into the world he knew. He wanted to shout for sheer joy; but more than all else he wanted to leap at the ugly thing who stood blinking his eyes in the mouth of the cave.

The thought of escape was strong upon him, but the touch of a timid hand showed the folly of that. Luhra was beside him, her filmy lacework shining softly in the sun, to make more lovely the delicate flush beneath. Her eyes, shielded from the sun, were upon him with a look half hopeful, half despairing. No, he must see it through—go on with his play-acting—meet magic with magic. Horab had come out from the cave, and spear in hand he stood commandingly above them on a huge boulder. Yes, the magic must go on.

The harsh voice of the savage ripped out unintelligible words. Luhra translated. "It is changed," she said, "and Horab fears. But the water is there, and there is no burning death.... He says your *Tao* is weak."

Garry stared with thankful eyes across the blue expanse where a line of white marked ghostly breakers on a distant shore; where hills were reflected in the shimmering blue. But the sun was still above their tops, so he must spar for time—

"My *Tao* is strong," he said, and went on with whatever fantastic thoughts came into his mind. He was talking against time. He told of the new world his *Tao* had built, of men harnessing the lightning and flying through the air; of cannon that roared like the thunder and threw death and destruction upon those that the *Tao* would destroy.... And his eyes watched the slow descent of the dropping sun, while the figure above stirred impatiently and raised his spear.

"A sign!" Luhra was imploring. "He does not believe!"

The golden ball was touching now on a distant, purple peak. The amazing magic of the desert!—its moment had come! Garry indicated as best he could the phantom sea, so real, below.

"My *Tao* has spoken," he shouted: "watch! The waters shall be dried up; the seas shall become a desert of hot sand; the lands and waters that Horab knows shall be no more! There shall be no food for his stomach nor water for his lips where Horab wanders in torment.... Unless I save him."

He turned to stare at the vast mirage. He knew that the eyes of the others had followed his, and he knew that they saw the first change that crept over the land.

The blue that was so unmistakably a sea was dissolving; it seemed sucked into the sand. And, while yet the hot rays cast their lingering gold over mountain and plain, the seas faded and were gone ... and where they had been in unquestioned reality was only yellow sand that whirled hotly and drifted in the first breath of the coming night....

The towering figure above them stood rigid. Garry had found a sharp edge of rock, and sawed frantically upon it to cut the soft gold of the cords at his wrists. The one above them paid no heed; his eyes were held in horror of this silent death that swept across the world.

The hand that Garry extended was steady and cautious; his arm crept about the body of white and gold to draw the amazed and wondering girl silently into the open cave.

"Follow!" he ordered, and dashed headlong down the darkened way where an automatic was waiting for his eager fingers.

The pack was there, and he tore at it with frenzied hands to grip at the pistol within. And there was also an open chest whose contents glittered in the green light, and whose weight was not too great for him to carry....

He had both chest and gun when he returned. The stumbling falls in his mad rush had not served to allay

the hurts of his tortured body, nor still his raging fury. He called to Luhra as he ran—and realized that Luhra was gone. The chest fell forgotten at his feet as he rushed out; he shouted her name and cursed himself for leaving her.

Had the fascination of the outer world drawn her back? Had she trusted too greatly in the power of his Tao to shield her from harm? Connell could not know. He knew only that he saw her struggling in the grip of the long arms where the black one held her on an outthrust rock.

They were a hundred feet away, yet the black face beneath its pointed skull showed plainly its bestial fury as Garry sprang forward. With one motion the tall figure dashed the girl to the stone at his feet and raised his spear. He paused to laugh harshly at the man who rushed toward him—who could never reach him to stop the fatal thrust.

A threat, it might have been, to hold the attacker off, or a murderous intent to end now and forever this one captive's life: Garry did not wait to learn. And the

hundred-foot distance that meant a hundred feet of safety to the savage was spanned by a stream of lead from a gun whose stabbing flashes cracked sharply upon the still air. The ringing clatter of a spear that fell among granite stones came thinly to Garry as he saw the black form of Horab, king of another day, spin dizzily from the rock on which he stood.

He had hit him—wounded him at least—and the firing of that wild fusillade might have emptied the magazine! Gary waited for nothing more, but gathered the limp body of the girl within his outstretched arms and carried her stumblingly across the welter of rocks on the boulder-strewn slope. Nor did he stop until he had gained the safety of open ground beyond the marks of the great slide.

The earth was shivering and weaving as he laid her down; a rock crashed sharply in the distance. Garry turned to retrace his steps and leap wildly from rock to rock toward the mouth of the cave in a granite cliff. And the metal chest was in his arms when he returned where Luhra waited.

The ground was alive with sickening motion, he was nauseated with earthquake sickness, but he gave thought only to his gun and the one cartridge that he found in the chamber. He steadied his arm upon a rock to take aim at a figure on a distant slope.

Horab had climbed back upon the rock. A lean figure and black, he was sharply outlined in the last rays of the setting sun; the target was clear beyond the pistol's sights. But the fingers of the grim-faced man refused to tighten upon the trigger.

Savage and cruel—a relic of a bygone age! He stood there, ludicrous and unreal in his stark black nakedness, his frayed robes of crimson whipping to tatters in the breeze. Yet he had forgotten his wounds—Horab was standing upright—and Garry's hand that held the pistol fell loosely at his side. The hate melted from his heart as he watched where Horab drew himself painfully erect.

A barbarous figure was Horab, and evil beyond redemption, yet there were not lacking the attributes of a king in the grotesque form whose head was still

held high. The sun made flashing brilliance of the jewels on that distorted head, while he stared with hopeless, savage eyes across the changed world where he could have no part. His *Tao* had failed him; his enemy had struck him down; and now—

The rock that had been a rest for Garry's arm was swaying, and to his ears came a rumble and groan. Sentinel Mountain, that had watched the ages pass, that had seen the oceans truly change to sand, protested again at this disturbance of its own long sleep.

Garry heard the coming of the masses from above; the crashing din was deadening to his ears. They were safe—and his eyes were upon a savage figure, black and tall, that stared and stared, silently, across a sea of yellow sand. He watched it, clear-cut, motionless—until it vanished beneath the roaring flood of rocks.

And close in his arms there pressed the soft body of a trembling girl who touched his face and whispered: "Your *Tao*, my brave one, is strong. Hold me closely

that he may count me as your friend."

His own whispered words, though differing somewhat, were a fervent echo of hers. He saw the rocky masses piled high where the mouth of a cave had been; and "Thank God!" Garry Connell said, "we got out of there in time!"

The casket of jewels lay neglected among the rocks: to-morrow would be time enough to salvage the wealth for which he had risked his life. He swept the girl into his arms, and the sun's last rays made golden splendor of his burden as he carried her across the broken stones.

His ranch showed far below him when he stopped, but the green of date palms had vanished under the last great sweep of rocks. Some few that remained made dark splotches among the shadows that were engulfing the world.

What did it matter? Miramar—"Beautiful Sea!" He laughed grimly at thought of how that sea had served him, but his eyes were tender in his tanned and blood-

stained face.

Miramar could be restored. And it would be less
lonely now....

74 Beyond the Vanishing Point by Ray Cummings

The tale of a golden atom—an astounding adventure in size.

Chapter 1: The Fragment of Quartz

It was shortly after noon of December 31, 1960, when the series of weird and startling events began which took me into the tiny world of an atom of gold, beyond the vanishing point, beyond the range of even the highest-powered electric-microscope. My name is George Randolph. I was, that momentous afternoon, assistant chemist for the Ajax International Dye Company, with main offices in New York City.

It was twelve-twenty when the local exchange call-sorter announced Alan's connection from Quebec.

"You, George? Look here, we've got to have you up here at once. Chateau Frontenac, Quebec. Will you come?"

I could see his face imaged in the little mirror on my desk; the anxiety, tenseness in his voice, was duplicated in his expression.

"Well—" I began.

"You must, George. Babs and I need you. See here—"

He tried at first to make it sound like an invitation for a New Year's Eve holiday. But I knew it was not that. Alan and Barbara Kent were my best friends. They were twins, eighteen years old. I felt that Alan would always be my best friend; but for Babs my hopes, longings, went far deeper, though as yet I had never brought myself to the point of telling her so.

"I'd like to come, Alan. But—"

"You must! George, I can't tell you over the public air. It's—I've seen him! He's diabolical! I know it now!"

Him! It could only mean, of all the world, one person!

"He's here!" he went on. "Near here. We've seen him to-day! I didn't want to tell you, but that's why we came. It seemed a long chance, but it's he, I'm positive!"

I was staring at the image of Alan's eyes; it seemed that there was horror in them. And in his voice. "God, George, it's weird! Weird, I tell you. His looks—he—oh I can't tell you now! Only, come!"

I was busy at the office in spite of the holiday season, but I dropped everything and went. By one o'clock that afternoon I was wheeling my little sport midge from its cage on the roof of the Metropole building, and went into the air.

It was a cold gray afternoon with the feel of coming snow. I made a good two hundred and fifty miles at first, taking the northbound through-traffic lane

which to-day the meteorological conditions had placed at 6,200 feet altitude.

Flying is largely automatic. There was not enough traffic to bother me. The details of leaving the office so hastily had been too engrossing for thought of Alan and Babs. But now, in my little pit at the controls, my mind flung ahead. They had located him. That meant Franz Polter, for whom we had been searching nearly four years. And my memory went back into the past with vivid vision....

The Kents, four years ago, were living on Long Island. Alan and Babs were fourteen years old, and I was seventeen. Even then Babs represented to me all that was desirable in girlhood. I lived in a neighboring house that summer and saw them every day.

To my adolescent mind a thrilling mystery hung upon the Kent family. The mother was dead. Dr. Kent, father of Alan and Babs, maintained a luxurious home, with only a housekeeper and no other servant. Dr. Kent was a retired chemist. He had, in his home, a chemical laboratory in which he was working upon

some mysterious problem. His children did not know what it was, nor, of course, did I. And none of us had ever been in the laboratory, except that when occasion offered we stole surreptitious peeps.

I recall Dr. Kent as a kindly, iron-gray haired gentleman. He was stern with the discipline of his children; but he loved them, and was indulgent in a thousand ways. They loved him; and I, an orphan, began looking upon him almost as a father. I was interested in chemistry. He knew it, and did his best to help and encourage me in my studies.

There came an afternoon in the summer of 1956, when arriving at the Kent house, I ran upon a startling scene. The only other member of the household was a young fellow of twenty-five, named Franz Polter. He was a foreigner, born, I understood, in one of the Balkan Protectorates; and he was here, employed by Dr. Kent as laboratory assistant. He had been with the Kents, at this time, two years. Alan and Babs did not like him, nor did I. He must have been a clever, skilful chemist. No doubt he was. But in aspect he was, to us, repulsive. A hunchback, with a short

thick body; dangling arms that suggested a gorilla; barrel chest; a lump set askew on his left shoulder, and his massive head planted down with almost no neck. His face was rugged in feature; a wide mouth, a high-bridged heavy nose; and above the face a great shock of wavy black hair. It was an intelligent face; in itself, not repulsive.

But I think we all three feared Franz Polter. There was always something sinister about him, quite apart from his deformity.

I came, that afternoon, upon Babs and Polter under a tree on the Kent lawn. Babs, at fourteen with her long black braids down her back, bare-legged and short-skirted in a summer sport costume, was standing against the tree with Polter facing her. They were about of a height. To my youthful imaginative mind rose the fleeting picture of a young girl in a forest menaced by a gorilla.

I came upon them suddenly. I heard Polter say:

"But I lof you, And you are almos' a woman. Some day

you lof me."

He put out his thick hand and gripped her shoulder. She tried to twist away. She was frightened, but she laughed.

"You—you're crazy!"

He was suddenly holding her in his arms, and she was fighting him. I dashed forward. Babs was always a spunky sort of girl. In spite of her fear now, she kept on laughing, and she shouted:

"You—let me go, you—hunchback!"

He did let her go; but in a frenzy of rage he hauled back his hand and struck her in the face. I was upon him the next second. I had him down on the lawn, punching him; but though at seventeen I was a reasonably husky lad, the hunchback with his thick, hairy gorilla arms proved much stronger. He heaved me off. And then the commotion brought Alan.

Without waiting to find out what the trouble was, he jumped on Polter. Between us, I think we would have

beaten him pretty badly. But the housekeeper summoned Dr. Kent and the fight was over.

Polter left for good within an hour. He did not speak to any of us. But I saw him as he put his luggage into the taxi which Dr. Kent had summoned. I was standing silently nearby with Babs and Alan. The look he flung us as he drove away carried an unmistakable menace—the promise of vengeance. And I think now that in his warped and twisted mind he was telling himself that he would some day make Babs regret that she had laughed at his love.

What happened that night none of us ever knew. Dr. Kent worked late in his laboratory; he was there when Alan and Babs and the housekeeper went to bed. He had written a note to Alan; it was found on his desk in a corner of the laboratory next morning, addressed in care of the family lawyer to be given Alan in the event his father died. It said very little. Described a tiny fragment of gold quartz rock the size of a walnut which would be found under the giant microscope in the laboratory; and told Alan to give it to the American Scientific Society to be guarded and

watched very carefully.

This note was found, but Dr. Kent had vanished! There had been a midnight marauder. The laboratory was on the lower floor of the house. Through one of its open windows, so the police said, an intruder had entered. There was evidence of a struggle, but it must have been short, and neither Babs, Alan, the housekeeper nor any of the neighbors heard anything amiss. And the fragment of golden quartz was gone!

The police investigation came to nothing. Polter was found in New York. He withstood the police questions. There was nothing except suspicion upon which he could be held, and he was finally released. Immediately, he disappeared.

Neither Alan, Babs nor I saw Polter again. Dr. Kent had never been heard from to this day, four years later when I flew to join the twins in Quebec. And now Alan had told me that Polter was up there! We had never ceased to believe that Dr. Kent was alive, and that Polter was the midnight marauder. And as we grew older, we began to search for Polter. It seemed

to us that now we were older, if we could once get our hands on him, we could drag from him the truth in which the police had failed.

The call of a traffic director in mid-Vermont brought me back from these vivid thoughts. My buzzer was clanging; a peremptory halting-signal day-beam came darting up at me from below. It caught me and clung: I shouted down at it.

"What's the matter?" I gave my name and number and all the details in a breath. Above everything I had no wish to be halted now. "What's the matter? I haven't done anything wrong."

"The hell you haven't," the director roared. "Come down to three thousand. That lane's barred."

I dove obediently and his beam followed me. "Once more like that, young fellow—" But he went busy with somebody else and I didn't hear the end of his threat.

I crossed into Maine in mid-afternoon. Twilight was upon me. The sky was solid lead. The landscape all up

through here was gray-white with snow in the gathering darkness. I passed the city of Jackman, crossing full over it to take no chances of annoying the border officials; and a few miles further, I dropped to the glaring lights of the International Inspection Field. The formalities were soon finished. I was ready to take-away when Alan rushed at me.

"George! I thought I could connect here." He gripped me. He was wild-eyed, incoherent. He waved his taxiplane away. "I'm going back with my friend. George. I can't—I don't know what's happened to her. She's gone, now!"

"Who's gone? Babs?"

"Yes." He pushed me into my plane and climbed in after me. "Don't talk. Get us up! I'll tell you then. I shouldn't have left."

When we were up in the air, I swung on him. "What are you talking about? Babs gone?"

I could feel myself shuddering with a nameless horror.

"I don't know what I'm talking about, George. I'm about crazy. The Quebec police think I am, anyway. I been raising hell with them for an hour. Babs is gone. I can't find her. I don't know where she is."

He finally calmed down enough to tell me. Shortly after his radiophone to me in New York, he had missed Babs. They had had lunch in the huge hotel and then walked on the Dufferin Terrace—the famous promenade outside looking down over the lower city, the great sweep of the St. Lawrence River and the gray-white distant Laurentian mountains.

"I was to meet her inside. I went in ahead of her. But she didn't come. I went back to the terrace and she was gone. Wasn't in our rooms. Nor the lobby—nor anywhere."

But it was early afternoon, in the public place of a civilized city. In the daylight of the Dufferin Terrace, beside the long ice toboggan slide, under the gaze of skaters on the ice-rink and several hundred holiday merrymakers, a young girl could hardly be murdered, or forcibly abducted, without attracting some

attention! The Quebec police thought the young American unduly excited over his sister, who was missing only an hour. They would do what they could, if by dark she had not rejoined him. They suggested that doubtless the young lady had gone shopping.

"Maybe she did," I agreed. But in my heart, I felt differently. "She'll be waiting for us in the hotel when we get there, Alan."

"But I'm telling you we saw Polter this morning. He lives here—not thirty miles from Quebec. We saw him on the terrace after breakfast. Recognized him at once."

"Did he see you?"

"I don't know. He was lost in the crowd in a minute. But I asked a young French fellow who it was. He knew him. Told me, Frank Raskor. That's the name he wears now. He's a famous man up here—well known, immensely rich. I don't know if he saw us or not. What a fool I was to leave Babs alone, even for a minute!"

We were speeding over a white-clad valley with a little frozen river winding down its middle. Almost full night had come. The leaden sky was low above us. It began snowing. The lights of the small villages along the river were barely visible.

"Can you land us, Alan?"

"Yes, surely. Municipal field just beyond the Citadel. We can get to the hotel in five minutes. Good landing lights."

It was a flight of only half an hour. During it, Alan told me about Polter. The hunchback, known now as Frank Rascor, owned a mine in the Laurentides, some thirty miles from Quebec City—a fabulously productive mine of gold. It was an anomaly that gold should be produced in this region. No vein of gold-bearing rock had been found, except the one on Polter's property. Alan had seen a newspaper account of the strangeness of it; and just upon the chance had come to Quebec, seen Frank Rascor on the Dufferin Terrace, and recognized him as Polter.

Again my thoughts went back into the past. Had Polter stolen that missing fragment of golden quartz the size of a walnut which had been beneath Dr. Kent's microscope? We always thought so. Dr. Kent had some secret, some great problem upon which he was working. Polter, his assistant, had evidently known, or partially known, its details. And now, four years later, Polter was immensely rich, with a "gold mine" in mountains where there was no other such evidence of gold!

I seemed to see some connection. Alan, I knew, was groping with a dim idea, so strange he hardly dared voice it.

"I tell you, it's weird, George. The sight of him. Polter—heavens, one couldn't mistake that hunchback—and his face, his features, just the same as when we knew him."

"Then what's weird?? I demanded.

"His age." There was a queer solemn hush in Alan's voice. "George, when we knew Polter, he was about

twenty-five, wasn't he? Well, that was four years ago. But he isn't twenty-nine now! I swear it's the same man—but he isn't around thirty. Don't ask me what I'm talking about. I don't know. But he isn't thirty. He's nearer fifty! Unnatural! Weird! I felt it, and so did Babs, just that brief look we had at him."

I did not answer. My attention was on managing the plane. The lights of Sevis were under us. Beyond the city cliffs the St. Lawrence lay in its deep valley; and the Quebec lights, the light-dotted ramparts with the terrace and the great fortress-like hotel showed across the river.

"Better take the stick, Alan. I don't know where the field is. And don't you worry about Babs. She'll be back by now."

But she was not. We went to the two connecting rooms in the tower of the hotel which Alan and Babs had engaged. We inquired with half a dozen phone-calls. No one had seen or heard from her. The Quebec police were sending a man up to talk to Alan.

"Well, we won't be here," Alan called to me. He was standing by the window in Bab's room; he was trembling too much to use the phone. I hung up the receiver and went through the connecting door to join him.

Bab's room! It sent a pang through me. A few of her garments were lying around. A negligee was laid out on the dainty little bed. A velvet boudoir doll—she had always loved them—stood on the dresser. Upon this hotel room, in a day, she had impressed her personality. Her perfume was in the air. And now she was gone.

"We won't be here," Alan was repeating. He gripped me at the window. "Look!" In his hand was an ugly-looking, smokeless, soundless automatic of the Essen type. "And I've got another, for you. Brought them up with me."

His face was white and drawn, but his hands abruptly were steady. The tremble was gone out of his voice.

"I'm going after him. George! Now! Understand that?"

Now! His place is only thirty miles from here, out there in the mountains. You can see it in the daylight—a wall around his property and a stone castle which he built in the middle of it. A gold mine? Hell!"

There was nothing to be seen now out of the window but the snow-filled darkness, the blurred lights of lower Quebec and the line of dock-lights five hundred feet under us.

"Will you fly me, George?"

"Of course."

I was the one trembling now; the cool feel of the automatic which Alan thrust into my hand seemed suddenly to crystallize Bab's danger. I was here in her room, with the scent of her perfume around it, and this deadly weapon was needed! But the trembling was gone in a moment.

"Yes. Of course, Alan. No use talking to the police. You can't get a search warrant to ransack the castle of a rich man just because you can't find your sister. Come

on. You can tell me what his place is like as we go."

Bundled in our flying suits we hurried from the hotel, climbed the Citadel slope of the landing field, and in ten minutes were again in the air. The wind sucked at us. The snow now was falling with thick huge flakes. Directed by Alan, I headed out over the ice-filled St. Lawrence, past the frozen Isle d'Orleans, toward Polter's mysterious mountain castle.

Suddenly Alan burst out, "I know what father's secret was, George! I can piece it together now, from little things that were meaningless when I was a kid. He invented the electro-microscope. You know that. The infinitely small fascinated him. I remember he once said that if we could see far enough down into smallness, we would come upon human life!"

Alan's low tense voice was more vehement than I had ever heard it before. "It's clear to me now, George. That little fragment of golden quartz which he wanted me to be so careful of contained a world with human inhabitants! Father knew it, or suspected it. And I think the chemical problem on which he was working

aimed for some drug. I know it was a drug they were compounding. Polter said so once, a radio-active drug; I remember listening at the door. A drug, George, capable of making a human being infinitely small!"

I did not answer when momentarily Alan paused. So strange a thing! My mind whirled with it; struggled to encompass it. And like the meaningless pieces of a puzzle, dropping so easily into place when the key-piece is fitted. I saw Polter stealing that fragment of gold; abducting Dr. Kent—perhaps because Polter himself was not fully acquainted with the secret. And now, Polter, up here with a fabulously rich "gold mine." And Babs, abducted by him, to be taken—where?

It set me shuddering.

"Alan!"

"That's what it was!" Alan reiterated. "And Polter, here now with what he calls a 'mine.' It isn't a mine, it's a laboratory! He's got father, too, hidden God

knows where! And now Babs. We've got to get them.
George! The police can't help us! It's just you and me,
to fight this thing. And it's diabolical!"

Chapter 2: The Girl an Inch Tall

We soared over the divided channel of the St. Lawrence, between Orleans and the mainland. Montmorency Falls in a moment showed dimly white through the murk to our left, a great hanging veil of ice higher than Niagara. Further ahead, the lights of the little village of St. Anne de Beaupré were visible with the gray-black, towering hills behind them. Historic region! But Alan and I had no thoughts for it.

"Swing left, George. Over the mainland. That's St. Anne; we pass this side of it. Put the mufflers on. This damn thing roars like a tower siren."

I cut in the mufflers, and switched off our wing-lights. It was illegal, but we were past all thought of that. We were both desperate; the slow prudent process of acting within the law had nothing to do with this affair. We both knew it.

Our little plane was dark, and amid the sounds of this night blizzard our muffled engine could not be heard.

Alan touched me. "There are his lights; see them?"

We had passed St. Anne. The hills lay ahead—wild mountainous country stretching northward to the foot of Hudson Bay. The blizzard was roaring out of the north and we were heading into it. I saw, on what seemed a dome-like hill perhaps a thousand feet above the river level, a small cluster of lights which marked Polter's property.

"Fly over it once, George. Low—we can chance it. And find a place to land outside the walls."

We presently had it under us. I held us at five hundred feet, and cut our speed to the minimum of twenty miles an hour facing the gale, though it was sixty or seventy when we turned. There were a score or two of hooded ground lights. But there was little reflection aloft, and in the murk of the snowfall I felt we would escape notice.

We crossed, turned and went back in an arc following Polter's outer curved wall. We had a good view of it. A weird enough looking place, here on its lonely hilltop.

No wonder the wealthy "Frank Rascor" had attained local prominence!

The whole property was irregularly circular, perhaps a mile in diameter covering the almost flat dome of the hilltop. Around it, completely enclosing it, Polter had built a stone and brick wall. A miniature wall of China! We could see that it was fully thirty feet high with what evidently were naked high-voltage wires protecting its top. There were half a dozen little gates, securely barred, with doubtless a guard at each of them.

Within the wall there were several buildings: a few small stone houses suggesting workmen's dwellings; an oblong stone structure with smoke funnels which seemed perhaps a smelter; a huge, dome-like spread of translucent glass over what might have been the top of a mine-shaft. It looked more like the dome of an observatory—an inverted bowl fully a hundred feet wide and equally as high, set upon the ground. What did it cover?

And, there was Polter's residence—a castle-like brick

and stone building with a central tower not unlike a miniature of the Chateau Frontenac. We saw a stone corridor on the ground connecting the lower floor of the castle with the dome, which lay about a hundred feet to one side.

Could we chance landing inside the wall? There was a dark, level expanse of snow where we could have done it, but our descending plane would doubtless have been discovered. But the mile-wide inner area was dark in many places. Spots of light were at the little wall-gates. There was a glow all along the top of the wall. Lights were in Polter's house; they slanted out in yellow shafts to the nearby white ground. But for the rest, the whole place was dark, save a dim glow from under the dome.

I shook my head at Alan's suggestion. "We couldn't land inside." We had circled back and were a mile or so off toward the river. "You saw guards down there. But that low stretch outside the gate on this side—"

A plan was coming to me. Heaven knows it was desperate enough, but we had no alternative. We

would land and accost one of the gate guards. Force our way in. Once inside the wall, on foot in the darkness of this blizzard, we could hide; creep up to that dome. Beyond that my imagination could not go.

We landed in the snow a quarter of a mile from one of the gates. We left the plane and plunged into the darkness. It was a steady upward slope. A packed snowfield was under foot, firm enough to hold our shoes, with a foot or so of loose soft snow on its top. The falling flakes whirled around us. The darkness was solid, Our helmeted leather-furred flying suits were soon shapeless with a gathering white shroud. We carried our Essens in our gloved hands. The night was cold, around zero I imagine, though with that biting wind it felt far colder.

From the gloom a tiny spot of light loomed up.

"There it is, Alan. Easy now! Let me go first." The wind tore away my words. We could see the narrow rectangle of bars at the gate, with a glow of light behind them.

"Hide your gun, Alan." I gripped him. "Hear me?"

"Yes."

"Let me go first. I'll do the talking. When he opens the gate, let me handle him. You—if there are two of them—you take the other."

We emerged from the darkness, into the glow of light by the gate. I had the horrible feeling that a shot would greet us. A challenge came, at first in French, then in English.

"Stop! What do you want?"

"To see Mr. Rascor."

We were up to the bars now, shapeless hooded bundles of snow and frost. A man stood in the doorway of a lighted little cubby behind the bars. A black muzzle in his hand was leveled at us.

"He sees no one. Who are you?"

Alan was pressing at me from behind. I shoved back, and took a step forward. I touched the bars.

"My name is Fred Davis. Newspaper man from Montreal. I must see Mr. Rascor."

"You cannot. You may send in your call. The mouthpiece is there—out there to the left. Bare your face; he talks to no one without the face image."

The guard had drawn back into his cubby; there was only this extended hand and the muzzle of his weapon left visible.

I took a step forward. "I don't want to talk by phone. Won't you open the gate? It's cold out here. We have important business. We'll wait with you."

Abruptly the gate lattice slid aside. Beyond the cubby doorway was the open darkness within the wall. A scuffed path leading inward from the gate showed for a few feet.

I walked over the threshold, with Alan crowding me.

The Essen in my coat pocket was leveled. But from the cubby doorway, I saw that the guard was gone! Then I saw him crouching back of a metal shield. His voice rang out.

"Stand!"

A light struck my face—a little beam from a television sender beside me. It all happened in an instant, so quickly Alan and I had barely time to make a move. I realized my image was now doubtless being presented to Polter. He would recognize me!

I ducked my head, yelling: "Don't do that! You frighten me!"

It was too late! The guard had received a signal. I was aware of its buzz.

From the shield a tiny jet of fluid leaped at me. It struck my hood. There was a heavy, sickening-sweet smell. It seemed like chloroform. I felt my senses going. The cubby room was turning dark; was roaring.

I think I fired at the shield. And Alan leapt aside. I heard the faint hiss of his Essen. And his choked, horrified voice:

"George—come back! Run! Don't fall! Don't!"

I crumpled; slid into blackness. And it seemed, as I went down, that Alan's inert body was falling on top of me....

I recovered consciousness after a nameless interval, a phantasmagoria of wild, drugged dreams. My senses came slowly. At first, there were dim muffled voices and the tread of footsteps. Then I knew that I was lying on the ground, and that I was indoors. It was warm. My overcoat was off. Then I realized that I was bound and gagged.

I opened my eyes. Alan was lying inert beside me, roped and with a black gag around his face and in his mouth. We were in a huge dim open space. Presently, as my vision cleared, I saw that the dome was overhead. This was a circular, hundred-foot-wide room. It was dimly lighted. The figures of men were

moving about, their great misshapen shadows shifting with them. Twenty feet from me there was a pile of golden rock—chunks of gold the size of a man's fist, or his head, and larger, heaped loosely into a mound ten feet high.

Beyond this pile of ore, near the center of the room, twenty feet above the concrete floor, there was a large hanging electrolier. It cast a circular glow downward. Under it I saw a low platform raised a foot or two above the ground. A giant electro-microscope was hung with its twenty-foot cylinder above the platform. Its intensification tubes were glowing in a dim phosphorescent row on a nearby bracket. A man sat in a chair on the platform at the microscope's eyepiece.

I saw all this with a brief glance, then my attention went to a white stone slab under the giant lense. It rested on the platform floor, a two-foot-square surface of smooth white stone like marble. A little roped railing a few inches high fenced it. And in its center lay a fragment of golden quartz the size of a walnut!

There was a movement across my line of vision. Two figures advanced. I recognized both of them. And I strained at my bonds; mouthed the gag with futile, horrified effort. I could no more than writhe; and I could not make a sound. I lay, after a moment exhausted, and stared with horror.

The familiar hunched figure of Polter advanced toward the microscope. And with him, his huge hand holding her wrists, was Babs. They were nearly fifty feet from me, but with the light over them I could see them clearly. Bab's slim figure was clad in a long skirted dress—pale blue, now, with the light on it. Her long black hair had fallen disheveled to her shoulders. I could not see her face. She did not cry out. Polter was half dragging her as she resisted him; and then abruptly she ceased struggling.

I heard his guttural voice. "That iss better."

They mounted to the platform. It seemed to me that they must have been far away; they were very small. Abnormally small. I blinked. Horror surged over me. Their figures were dwindling as they stood there!

Polter was saying something to the man at the microscope. Other men were nearby, watching. All normal, save Polter and Babs. A moment passed. Polter was standing by the chair in which the man at the microscope was sitting. And Polter's head barely reached its seat! Babs was clinging to him, now. Another moment. They were both little figures down by the chair-leg. Then they began walking with swaying steps toward the tiny railing of the white slab. The white reflection from the slab plainly illumined then. Polter's arm was around Babs. I had not realized how small they were until I saw Polter lift the rope of the four-inch little fence, and he and Babs stooped and walked under it. The fragment of quartz lay a foot from them in the center of the white surface. They walked unsteadily toward it. But soon they were running.

My horrified senses whirled. Then abruptly I felt something touch my face! Alan and I were lying in shadow. No one had noticed my writhing movements, and Alan was still in drugged unconsciousness. Something tiny and light and soundless as a butterfly

wing brushed my face! I jerked my head aside. On the floor, within six inches of my eyes, I saw the tiny figure of a girl an inch high! She stood, with a warning gesture to her lips—a human girl in a filmy flowing drapery. Long pale golden tresses lay on her white shoulders; her face, small as my little fingernail, colorful as a miniature painted upon ivory, was so close to my eyes that I could see her expression—warning me not to move.

There was a faint glow of light on the floor where she stood, but in a moment she moved out of it. Then I felt her brush against the back of my head. My ear was near the ground. A tiny warm hand touched my earlobe; clung to it. A tiny voice sounded in my ear.

"Please do not move your head! You might kill me!"

There was a pause. I held myself rigid. Then the tiny voice came again.

"I am Glora, a friend. I have the drug! I will help you!"

Chapter 3: The Fight in the Shrinking Dome Room

It seemed that Alan was stirring. I felt the tiny hand leave my ear. I thought that I could hear faint little footfalls as the girl scampered away, fearful that a sudden movement from Alan would crush her. I turned cautiously after a moment and saw Alan's eyes upon me. He too had seen, with a blurred returning consciousness, the dwindling figures of Babs and Polter. I followed his gaze. The white slab with the golden quartz under the microscope seemed empty of human movement. The several men in this huge circular dome-room were dispersing to their affairs: three of them sat whispering by what I now saw was a pile of gold ingots stacked crosswise. But the fellow at the microscope held his place, his eye glued to its aperture as he watched the vanishing figures of Polter and Babs on the rock-fragment.

Alan seemed trying to convey something to me, He could only gaze and jerk his head. I saw behind his head the figure of the tiny girl on the floor behind him. She wanted evidently to approach his head but did not dare. When for an instant he was quiet, she

ran forward, but at once scampered back.

From the group by the ingots, one of the men rose and came toward us. Alan held still, watching. And the girl, Glora, seized the opportunity to come nearer. We both heard her tiny voice:

"Do not move! Close your eyes! Make him think you are still unconscious."

Then she was gone, like a mouse hiding in the shadows near us.

Amazement swept Alan's face; he twisted, mouthed at his gag. But he saw my eager nod and took his cue from me.

I closed my eyes and lay stiff, breathing slowly. Footsteps approached. A man bent over Alan and me.

"Are you no conscious yet?" It was the voice of a foreigner, with a queer, indescribable intonation. A foot prodded us. "Wake up!"

Then the footsteps retreated, and when I dared to look the man was rejoining his fellows. It was a strange-looking trio. They were heavy-set men in leather jackets and short, wide knee-length trousers. One wore tight, high boots, and the others a sort of white buskin, with ankle straps. All were bareheaded—round, bullet heads of close-dipped black hair.

I suddenly had another startling realization. These men were not of normal size as I had assumed! They were eight or ten feet tall at the very least! And they and the pile of ingots, instead of being close to me, were more distant than I had thought.

Alan was trying to signal me. The tiny girl was again at his ear, whispering to him. And then she came to me.

"I have a knife. See?" She backed away. I caught the pin-point gleam of what might have been a knife in her hand. "I will get a little larger. I am too small to cut your ropes. You lie still, even after I have cut them."

I nodded. The movement frightened her so that she leaped backward; but she came again, smiling. The three men were talking earnestly by the ingots. No one else was near us.

Gloria's tiny voice was louder, so that we both could hear it at once.

"When I free you, do not move or they may see that you are loose. I get larger now—a little larger—and return."

She darted away and vanished. Alan and I lay listening to the voices of the three men. Two were talking in a strange tongue. One called to the man at the microscope, and he responded. The third man said suddenly:

"Say, talk English. You know damn well I can't understand that lingo."

"We say, McGuire, the two prisoners soon wake up."

"What we oughta do is kill 'em. Polter's a fool."

"The doctor say, wait for him return. Not long—what you call three, four hours."

"And have the Quebec police up here lookin' fer 'em? An' that damn girl he stole off the terrace—What did he call her, Barbara Kent?"

"These two who are drugged, their bodies can be thrown in a gully down behind St. Anne. That what the doctor plan to do, I think. Then the police find them—days maybe from now—and their smashed airship with them."

Gruesome suggestion!

The man at the microscope called, "They are gone. Almost. I can hardly see them more." He left the platform and joined the others. And I saw that he was much smaller than they—about my own size possibly.

There seemed six men here altogether. Four now, by the ingots, and two others far across the room where I saw the dark entrance of the corridor-tunnel which led to Polter's castle.

Again I felt a warning hand touch my face, and saw the figure of Glora standing by my head. She was larger now—about a foot tall. She moved past my eyes; stood by my mouth; bent down over my gag. I felt the cautious side of a tiny knife-blade inserted under the fabric of the gag. She hacked, tugged at it, and in a moment ripped it through.

She stood panting from the effort. My heart was pounding with fear that she would be seen; but the man had turned the central light off when he left the microscope, and it was far darker here now than before.

I moistened my dry mouth. My tongue was thick, but I could talk.

"Thank you, Glora."

"Quiet!"

I felt her hacking at the ropes around my wrists. And then at my ankles. It took her a long time, but at last I was free! I rubbed my arms and legs; felt the

returning strength in them.

And presently Alan was free. "George, what—" he began.

"Wait!" I whispered. "Easy! Let her tell us what to do."

We were unarmed. Two, against these six, three of whom were giants.

Gloria whispered, "Do not move! I have the drugs. But I can no give them to you when I am still so small. I have not enough. I will hide—there." Her little arm gestured to where, near us, half a dozen boxes were piled. "When I am large as you, I come back. Be ready, quickly to act. I may be seen. I give you then the drug."

"But wait," Alan whispered. "We must know—"

"The drug to make you large. In a moment then you can fight these men. I had planned it for myself, to do that, and then I saw you held captive. That girl of your world the doctor just now steal, she is friend of

yours?

"Yes! Yes, Glora. But—" A thousand questions were springing in my mind, but this was no time to ask them. I amended, "Go! Hurry! Give us the drug when you can."

The little figure moved away from us and disappeared. Alan and I lay as we had before. But now we could whisper. We tried to anticipate what would happen; tried to plan, but that was futile. The thing was too strange, too astoundingly fantastic.

How long Glora was gone I do not know. I think, not over three or four minutes. She came from her hiding place, crouching this time, and joined us. She was, probably, of normal Earth size—a small, frail-looking girl something over five feet tall. We saw now that she was about sixteen years old. We lay staring at her, amazed at her beauty. Her small oval face was pale, with the flush of pink upon her cheeks—a face queerly, transcendently beautiful. It was wholly human, yet somehow unearthly, as though unmarked by even the heritage of our Earthly strifes.

"Now! I am ready." She was fumbling at her robe. "I will give you each the same."

Her gestures were rapid. She flung a quick glance at the distant men. Alan and I were tense. We could easily be discovered now, but we had to chance it. We were sitting erect. He murmured:

"But what do we do? What happens? What—"

On the palm of her hand were two small pink-white pellets. "Take these—one for each of you. Quickly!"

Involuntarily we drew back. The thing abruptly was gruesome, frightening. Horribly frightening.

"Quickly," she urged. "The drug is what you call highly radio-active. And volatile. Exposed to the air it is gone very soon. You are afraid? No! No, it will not harm you."

With a muttered curse at his own reluctance, Alan seized the pellet. I stopped him.

"Wait!"

The men momentarily were engaged in a low-voiced, earnest discussion. I dared to hesitate a moment longer.

"Gloria, where will you be?"

"Here. Right here. I will hide."

"We want to go after Mr. Polter." I gestured. "Into that little piece of golden rock. Is that where he went? Is that where he took the Earth girl?"

"Yes. My world is there—within an atom there in that rock."

"Will you take us?"

"Yes! Yes!"

Alan whispered suddenly, "Then let us go now. Get smaller, now."

But she shook her head vehemently. "That is not

possible. We would be seen as we climbed the platform and crossed the white slab."

"No." I protested. "Not if we get very small, hiding here first."

She was smiling, but urgently fearful of this delay. "Should we get that small, then it would be, from here"—she gestured toward the microscope—"to there, a journey of very many miles. Don't you understand?"

This thing so strange!

Alan was plucking at me. "Ready, George?"

"Yes."

I put the pellet on my tongue. It tasted slightly sweet, but seemed quickly melted and I swallowed it hastily. My head swam. My heart was pounding, but that was apprehension, not the drug. A thrill of heat ran through my veins as though my blood were on fire.

Alan was clinging to me as we sat together. Glora again had vanished. In the background of my whirling consciousness the sudden thought hovered that she had tricked us; done to us something diabolical. But the thought was swept away in the confusion of the flood of impressions upon me.

I turned dizzily. "All right, Alan?"

"Yes, I—I guess so."

My ears were roaring, the room seemed whirling, but in a moment that passed. I felt a sudden, growing sense of lightness. A humming was within me—a soundless tingle. To every tiny microscopic cell in my body the drug had gone. The myriad pores of my skin seemed thrilling with activity. I know now it was the exuding volatile gas of this disintegrating drug. Like an aura it enveloped me, acted upon my garments.

I learned later much of the principles of this and its companion drug. I had no thought for such things now. The huge dimly illumined room under the dome was swaying. Then abruptly it steadied. The strange

sensations within me were lessening, or I forgot them. And I became aware of externals.

The room was shrinking! As I stared, not with horror now, but with amazement and a coming triumph, I saw everywhere a slow, steady, crawling movement. The whole place was dwindling. The platform, the microscope, were nearer than before, and smaller. The pile of ingots, with the men off there, was shifting toward me.

"George! My God—weird!"

I saw Alan's white face as I turned to him. He was growing at the same rate as myself evidently, for of all the scene he only was unchanged.

We could feel the movement. The floor under us was shifting, crawling slowly. From all directions it came, contracting as though it were being squeezed beneath us. In reality our expanding bodies were pushing outward.

The pile of boxes which had been a few feet away,

were thrusting themselves at me I moved incautiously and knocked them over. They seemed small now, perhaps half their former size. Glora was standing behind them. I was sitting and she was standing, but across the litter, our faces were level.

"Stand up!" she murmured. "You all right now. I hide!"

I struggled to my feet, drawing Alan up with me. Now! The time for action was upon us! We had already been discovered. The men were shouting, clambering to their feet. Alan and I stood swaying. The dome-room had contracted to half its former size. Near us was a little platform, chair and microscope. Small figures of men were rushing at us.

I shouted, "Alan! Watch yourself!"

We were unarmed. These men might have automatics. But evidently they did not. Knives were in their hands. The whole place was ringing with shouts. And then a shrill siren alarm from outside was clanging.

The first of the men—a few moments before he had

seemed a giant—flung himself upon me. His head was lower than my shoulders. I met him with a blow of my fist in his face. He toppled backward; but from one side, another figure came at me. A knife-blade bit into the flesh of my thigh.

The pain seemed to fire my brain. A madness descended upon me. It was the madness of abnormality. I saw Alan with two dwarfed figures clinging to him. But he threw them off, and they turned and ran.

The man at my thigh stabbed again, but I caught his wrist and, as though he were a child, whirled him around me and flung him away. He landed with a crash against the shrunken pile of gold nuggets and lay still.

The place was in a turmoil. Other men were appearing from outside. But they stood now well away from us. Alan backed against me. His laugh rang out, half hysterical with the madness upon him as it was upon me.

"God! George, look at them! So small!"

They were now hardly the height of our knees. This was now a small, circular room, under a lowering concave dome. A shot came from the group of pigmy figures. I saw the small stab of flame, heard the sing of the bullet.

We rushed, with the full frenzy of madness upon us, enraged giants. What actually happened I can not recount. I recall scattering the little figures; seizing them; flinging them headlong. A bullet, tiny now, stung the calf of my leg. Little chairs and tables under my feet were crashing. Alan was lunging back and forth; stamping; flinging his tiny adversaries away. There were twenty or thirty of the figures here now. Then I saw some of them escaping.

The room was littered with wreckage. I saw that by some miracle of chance the microscope was still standing, and I had a moment of sanity.

"Alan, watch out! The microscope! The platform—don't smash it! And Glora! Look out for her!"

I suddenly became aware that my head and a shoulder had struck the dome roof. Why, this was a tiny room! Alan and I found ourselves backed together, panting in the small confines of a circular cubby with an arching dome close over us. At our feet the platform with the microscope over it hardly reached our boot-tops. There was a sudden silence, broken only by our heavy breathing. The tiny forms of humans strewn around us were all motionless. The others had fled.

Then we heard a small voice. "Here! Take this! Quickly! You are too large! Quickly!"

Alan took a step. And then a sudden panic was on us both. Glora was here at our feet. We did not dare turn; hardly dared move. To stoop might have crushed her. My leg hit the top of the microscope cylinder. It rocked but did not fall.

Where was Glora? In the gloom we could not see her. We were in a panic.

Alan began, "George, I say—"

The contracting inner curve of the dome bumped gently against my head. The panic of confusion which was upon us turned to fear. The room was closing in to crush us.

I muttered. "Alan! I'm going out!" I braced myself and heaved against the side and top curve of the dome. Its metal ribs and heavy translucent, reinforced glass plates resisted me. There was an instant when Alan and I were desperately frightened. We were trapped, to be crushed in here by our own horrible growth. Then the dome yielded under our smashing blows. The ribs bent; the plates cracked.

We straightened, pushed upward and emerged through the broken dome, with head and shoulders towering into the outside darkness and the wind and snow of the blizzard howling around us!

Chapter 4: The Journey Into Smallness

"Gloria, that—that was horrible."

We stood, again in normal size, with the wrecked dome-laboratory around us. The dome had a great jagged hole halfway up one of its sides, through which the snow was falling. The broken bodies strewn around were gruesome.

Alan repeated, "Horrible, Gloria. This drug, the power of it, is diabolical."

Gloria had grown large after us; had given us the companion drug. I need not detail the strange sensations of our dwindling. We were so soon to experience them again!

We had searched, when still large, all of Polter's grounds. Some of his men undoubtedly escaped, made off into the blizzard. How many, we never knew. None of them ever made themselves known again.

We were ready to start into the atom. The fragment of

golden quartz still lay under the microscope on the white square of stone slab. We had hurried with our last preparations. The room was chilling. We were all inadequately dressed for such cold.

I left a note scribbled on a square of paper by the microscope. With daylight, Polter's wrecked place would be discovered. The police would come.

"Guard this piece of golden quartz. Take it at once, very carefully, to the Royal Canadian Scientific Society. Have it watched day and night. We will return."

I signed it George Randolph. And as I did so, the extraordinary aspect of these events swept me anew. Here in Polter's weird place I had seemed living in some strange fantastic realm. But this was the Province of Quebec, in civilized Canada. These were the Quebec authorities I was addressing.

I flung the thoughts away. "Ready, Glora?"

"Yes."

Then doubts assailed me. None of Polter's men had gotten large to fight us. Evidently he did not trust them with the drug. We could well believe that, for the thing, misused, was diabolical beyond human conception. A single giant, a criminal, a madman, by the power of giant size alone, could devastate the earth! The drug, lost, or carelessly handled, could get loose. Animals, insects, eating it, could roam the earth, gigantic monsters! Vegetation, nourished with it, might in a day overrun a great city, burying it with a jungle growth!

How terrible a thing, if the realm of smallness were suddenly to emerge! Monsters of the sea, marine organisms, could expand until even the ocean was too small for them. Microbes of disease, feeding upon this drug—

Alan was gripping me. "We're ready, George."

"Yes. Yes, I'm ready."

This was not largeness we were facing now, but smallness. I thought of Babs, down there with Polter,

beyond the vanishing point in the realm of the infinitely small. They had been gone an hour at least. Every moment lost now was adding to Bab's danger.

"Yes. I'm ready, Alan."

Gloria sat with us on the platform. Strange little creature! She was wholly calm now; methodical with her last directions. There had been no time for her to tell us anything about herself. Alan had asked her why she had come here and how she had gotten the drugs. She waved him away:

"On the journey down. Plenty of time, then."

"How long?" Alan demanded.

"Not too long. If we are careful with managing the trip, what you might call ten hours."

And now as we were ready to start, she told us calmly:

"I will give you each your share of the drugs, but

them you take only as I tell you."

She produced from her robe several small vials a few inches long. They were tightly stoppered. The feel of them was cool and sleek; they seemed of some strange, polished metal. Some of them were tinted black while the others glowed opalescent. She gave each of us one vial of each kind.

"The light ones are for diminishing," she said. "We take them very carefully, one small pellet only at first."

Alan was opening one of his, but she checked him.

"Wait! The drug evaporates very quickly. I have more to say, first. We sit here together. Then you follow me to the white slab. We climb upon the little rock."

She laid her hands on our arms. Her blue eyes regarded us earnestly. Her manner was naive; childlike. But I could not mistake her intelligence; the force of character stamped on her face for all its dainty, ethereal beauty.

"Alan—" She smiled at him, and tossed back a straying lock of her hair which was annoying her. "You pay attention, Alan. You are very young, reckless. You listen. We must not be separated. You understand that, both of you? We will be always in that little piece of rock. But there will be miles of distance. And to be lost in size—"

Strange journey upon which now we were starting!
Lost in size?
